be bad behavior (in my opinion). A better memory management unit, a
protected mode where I/O instructions are illegal and hardware in general
is not accessible except through the OS might go a long way
to prevent ill-behaved programs. The Atari ST, the Mega (I think), the mac,
do not have these features. The Lisa and the Amiga (I think), and the 286
and 386 PC families do. They all cost more that the ST.

You mentioned the idea of having two mallocs, keep the old one and
add a new one that works. I really like this idea. There is lots
of precedent for this kind of approach. It concedes compatibility
while allowing new programs to take advantage of the new features.
This path does result in (potentially) unlimited growth.
I don't know how much space is left in the ROM's and if the
ST motherboard can handle the newer larger ROM's.

> How did you people get the bourne shell working right on the '86?

I don't know. It's probably proprietary anyway. I have probably
said too much in this article already. Nothing that our marketing
people won't tell prospective customers though.

5027. Desk Jet drivers?

Newsgroup: comp.sys.atari.st
Date: 1988-08-17 02:48:13 UTC
From: jlong@icc.afit.arpa
Message-ID: <537@afit-ab.arpa>
Source record: 251227

I have the opportunity to get my hands on an HP Desk-Jet at a price that is too good to pass up (I have a friend at HP Vancouver in the Desk-Jet div.). How many prog's out there support the Desk-Jet?
I would appreciate a posting, or E-mail from anyone who knows about this issue. Does WP support the Desk-Jet? I want to use the printer for my Thesis work, so I hope WP does have a driver. Info Please!!!!!

5028. Re: Mono shakes

Newsgroup: comp.sys.atari.st
Date: 1988-08-17 03:32:33 UTC
From: jpdres13@usl-pc.usl.edu
Message-ID: <7@usl-pc.usl.edu>
Source record: 251228

I finally got the shakes out of my mono monitor!

I called a friend of mine and asked him what he thought, (repairman for vax) and he told me to check out the connections at solder points on the circuit board of the monitor. I went to yet another friend's house and he resoldered a slew of "iffy" looking points on the board. That did it! The monitor works fine now, very solid.

5029. RE: Praising the ST

From: <<<<< Greg >>>>> <01659@AECLCR>
Subject: RE: Praising the ST
To: <INFO-ATARI16@SCORE.STANFORD.EDU>

I have long since known that computer loyalty is far stronger than loyalty to cars. C-64 owners buy Amigas, XE owners buy STs, etc. This blind loyalty to a computer manufacturer is often evidenced in the device specific magazines that heap praise upon fairly mediocre software (e.g. VIP is OK but bloody slow!!!!!).

I have no loyalties. I use a 1040ST and an AT at work. I have a Mega 2 at home. There are two MAC SEs in my Division at work and I act as a support person to the users via MAGIC SAC. If I had the bucks I would probably run out and buy a MAC II (love the colour). I am a USER, not a hacker nor a programmer, but a user.

However, in my daily activities at work and at home I have found that the following make the ST the best value for my money (and the company's money) at the present time:

1. Many of my best loved programs are public domain. The ST world has no shortage of great public domain codes (UNITERM and ST640 are the best examples), especially in the .ACC area. I use GEM on the AT at work and hate the fact that there are so few desk accessories. Maybe there is a commercial market porting .ACCs to the PC since businesses will actually BUY these things if they're on a PC.

2. While I am proficient at dBASE III Plus, LOTUS and Word Perfect (God I hate Word Perfect) I detest the fact that the PC lacked a common environment and as such all major codes I run interact differently. It is so easy to show novices how to use ST or MAC applications because of the consistent interfaces these machines use. While it can be argued that GEM is primitive compared to the MAC's opsys, it's a heck of a lot easier to teach (the ST has to have the smallest owner's manual of any major micro).

3. MAC's unstable HFS filing system makes me wince. Watch what happens with a software crash or a power outage - there is a good chance your hard disk will be obliterated (it's easy to find a MAC user who has had to reinstall all of his applications). Good old MAGIC SAC with MFS (I decided not to switch to HFS) is totally stable after a crash. Go ahead, re-boot your ST while running a MAC application and you will see that no harm is done to the MAGIC partition on your hard disk.

4. The ST arrived as a minimum 512K machine so it works very well as a single drive system with the aid of RAM disks. Just listen, you can hear the moans of single drive PC and MAC users.

5. ST software prices are the most reasonable of any system on the market today. I bought Timeworks desktop publisher (DTP) and it cost less than the HP laserjet driver sold for the MAC (LaserStart). In addition, DTP has drivers for the laserjet, postscript and other lasers. No self respecting ST owner would pay the kinds of prices that PC and MAC codes are asking (price/performance being a consideration).

6. I have full disk compatability with the PCs at work. I write with Word Writer on my ST and the secretary prints out the final copies to an HP laserjet using GEM 1ST Word Plus on her PC. EASYDRAW and GEMDRAW can be used interchangeably to create/edit diagrams (GEMDRAW has easier text handling capability). I have taken LOTUS data on a disk from my AT and read the file into EXCEL on a 1040ST. Graphs were created and printed on an HP laserjet (borrowed from the secretary), still on the ST under MAGIC SAC. The edited EXCEL file was rewritten as a LOTUS file and the AT copy updated by feeding the AT the disk written on the ST. Try doing these tricks on any other system!

Before anyone criticizes, Appletalk would have allowed me to print on the secretary's laser without borrowing it - the ST's not perfect!

I could go on, but this note is already quite long. The point is, the ST (which is "FLAMED" so much on Info-Digest16) does have some good points. Its strongest is, if you have an ST at work you can duplicate the system for peanuts at home. Just get a 520 or a 1040 with a mono monitor and then carry your hard disk home (I did it for ages with no harm to the SH204). For about $CDN 1000, depending on what you buy, you can have a powerful complement to a system at work. You can't do this for anywhere near the price with a MAC or a PC (unless you want some dog of an XT).

My only regrets about the ST are:

- software still lags behind the PC and MAC in terms of sophistication

- too much piracy abounds in the ST world, this makes truly wonderful programmers like Small, Moore and Hudson turn away from the ST because they cannot earn a living

- Atari is the ultimate VAPOURWARE firm. No wonder it was such an uphill battle to get STs at work (there are about 80 STs in our community of 4000, 2/3 at work and 1/3 in home use). From my brief exposure to Info-Digest16, I know Atari reads these listings faithfully so PLEASE work hard to change your image as the VW kings.

5030. archive-server at ssyx

Source record: 251231

I know that it is silly to comment on a subject that has been beaten to death as much as this subject. But I can't resist.

I do not understand why the developers who were smart enough to develop their own work arounds for Malloc cannot stop using their code and just start using Malloc again. In my mind I would believe Atari more if they put their foot down and developed a RELIABLE(Not necessarily good) os and laid down the law about rules and not suporting programs that do not follow them.

(I am sure that there are many reasons that each developer will cite and I realize that this does not address the issue of binaries that will break under the release of a new os.)

On another note, it was very interesting to see the commodore booth in Atlanta (SigGraph 88) and also to notice that there was no atari booth. I was very disappointed to see this, and am wondering if there is any significance to the fact that a company which is trying to sell a computer as a graphics machine does not invest in a booth in the foremost graphics conference in the world. (Just thinking aloud)

5034. Laser C bug

Newsgroup: comp.sys.atari.st
Date: 1988-08-17 16:32:27 UTC
From: jeff@polyof.UUCP
Message-ID: <365@polyof.UUCP>
Source record: 251234

Actually I wouldn't call it a bug, but more a deficience in the
grammar. The following drove me nuts:

for(x=-1; x<=1; x++) { ... }
I wanted to loop from -1 to 1. However, the above is ambigous, it is an
old style declaration. I did not find out until I tried my prog on our
UNIX system. The UNIX cc gives:
Warning: oldstyle declaration on line xx.

Laser gives no such warning and actually takes whatever the previous
value was and drecrements it by one. then does the loop. not what i thought it
would do.

just thought I should let someone know.

From: greg@bilbo (Greg Wageman)
Path: bilbo!greg

Yes, but not all of us have the OS on disc. I know that I don't; my
1040ST came only with BASIC when bought about a year and a half ago.

But you're right; Atari could release the 'fixed' version in ROM for
new machines and retrofits, and provide the old version on a floppy
disk, so that users could boot the appropriate version for the software
they wish to use. This is a pain, admittedly, but Macintosh users
seem to cope (there are some programs which run with only certain
versions of System/Finder).

The OS-on-disc eats into user memory too, don't forget. But it seems
like a good way to get the fixes everyone wants into the ROMS without
undue hardship to the writers of "misbehaved" software. They could
even supply the proper OS on their release discs, with Atari's
permission and cooperation, of course.

Are you listening, Mr. Good?

} In recent articles, Roy J. Good @ Atari and others discuss the Malloc
} problem (qv). May I suggest the following solution:
}
} 1) build a proper version of Malloc (MallocP for "malloc
} patched" comes to mind). Assign it a TOS-call number, and
} give it reasonable semantics; Un*x semantics are as
} reasonable as any.
}
} 2) use this reasonable allocator as a foundation for a
} version broken in exactly the same ways as the current TOS
} version. That is, it obeys the assumptions that people are
} making about the current allocator (that it's okay to
} exceed your chunk, that chunks are contiguous, et al.), and
} make this broken allocator available through the old
} TOS-call number.

But this doesn't fix anything! The whole reason that Malloc is broken is that you can't allocate an arbitrary number of blocks, because a static area of memory is set aside for block descriptors. Any reasonable malloc uses the blocks themselves to keep track (by using the space just before or just after a free block as linkage to the next block), but we can't do that because people keep messing with memory they don't own, and so on.

> single-step exceptions (this includes traps, and thus GEMDOS, BIOS,
> XBIOS and GEM traps), ...

Having written a debugger, I can tell you that this is not the case.

When the trace bit is on at the START of an instruction, the trace exception will happen at the END of the instruction. What this means is that if the T bit is on at the start of the TRAP instruction, the debugger will get the trace exception at the END of the TRAP instruction -- when the PC is at the first instruction of the trap handler. The SR at this point is clear (because the TRAP instruction cleared it), but the debugger is free to set it again.

Unfortunately, this is not quite what you want: if you WANT to avoid tracing through the trap handler, you pay a price. Remember that the SR which the TRAP instruction pushed has the trace bit set, but the SR which the trace exception pushed has it clear. If the debugger doesn't set the T bit again, and rte's from the trace exception, the trap handler will execute at full speed. It will (presumably) RTE, and restore the SR with the T bit set. But since the T bit was clear at the START of the RTE instruction, you get no trace exception at the END of the RTE. Since T bit is set at the START of the first instruction after the TRAP (that is, the instruction the RTE returned to), you will get the trace exception at the end of THAT instruction. But by now your PC points to the SECOND instruction after the TRAP. This is not ideal.

My debugger happens to have both modes: an "untrace" mode which sets the T bit every time (and therefore single-steps through trap handlers) and the normal mode, which treats trap instructions specially: it sets a breakpoint immediately after the trap instruction, and runs the trap instruction (and therefore the trap handler) at full speed, without the T bit set at all.

>
> I have an idea, why not provide both 'fixed' Malloc and the
> old Malloc ... provided the new TOS ROM has enough space to put
> both versions of Malloc in.
>
> Jinfu Chen

Jinfu has hit the nail squarely on the head. There isn't enough
room for both versions of Malloc in the ROMs unfortunately. Believe me,
folks, these ROMs are packed full o' goodies. The french ROM, for example,
has less than 100 bytes free! (sizes vary because of differing desktop and
AES resources)

I also wanted to mention that I have really enjoyed the discussions on
the net of late regarding why or why not to break old software. A special
thanks for letting me read the newsgroup without having to put in eye drops
to soothe eyes burning from the flames!
I personally am more of a TOS "purist" -- I want to see things
fixed. Momma taught me: "If it ain't worth doing right, it ain't worth
doing at all." Unfortunately, with a consumer product like the ST, things
aren't so black and white. Compatibility is a *major* concern for most
end users, so it must be a concern for us. There's no easy answer.
But the views of all of you in net-land really do help.

I'm working on the port. The CCCP (C-Compatible Compiler Preprocessor) is already done. If there is some interest on this part, i could post the binary and/or the sources to the net. CCCP needs large amounts of memory since the whole preprocessing is done in memory, but it is very fast. The program is about 46k large (source ~ 200k).

5040. seeking personal home budget software reviews

Newsgroup: comp.sys.atari.st
Date: 1988-08-17 19:45:49 UTC
From: robert@richp1.UUCP
Message-ID: <372@richp1.UUCP>
Source record: 251240

I am looking for a personal finance budget program for a 1040ST.

So far, I've only looked at a package called "Dollars & Sense".
First impression is that it is pretty good. A review that I read
about it (early 1987) says that it has occasional "Modula-2 errors"
that you can not recover from and must reboot. Does any one know if
this has been fixed recently? Are there any other bugs I should
beware of before I buy? Is there another personal home budget
software package as good or better than "Dollars & Sense" on the
market?

Thanks in advance.

Would've been nice to know this was coming ahead of time, then I would've saved the copy of umoria sources we got. I think you're best bet is to send the sources to the moderator as well. It's easy enough to generate context diffs on your nearest Unix box, but it's a bit harder for most ST users to apply them. (Anyone working on porting Larry Wall's patch program?)

This gives me an idea - p'raps people might want to start posting about their current ST programming projects? Would give a greater indication of an interested community, and also allows for people working on similar things to connect with each other. At least, you'll know not to try to duplicate someone else's effort. At best, you could collaborate and come up with something Really Good a lot sooner.

Just to start, I could mention that I'm working with GNU's gcc, aiming at getting it running on TOS and Minix. I know someone has ported the KA9Q TCP/IP package to the ST finally, though they haven't been talking about it here, and I haven't seen mention of the source for that yet. A few people have casually mentioned NetHack 2.3. Has a bug fixed version ever appeared? Other things I'd like to get working are GNU Make and RCS. (Which would require working versions of diff and diff3, at least.) Anyone else doing something they feel like talking about?

>
> ATARI VS. AMIGA: WHAT TO BUY?
>
> * the bottom line is -- whatever you like best. *
> but here are some thoughts:
>
I have both an Amiga 2000 and a 1 meg upgraded 520 ST.
They are really more similar then most owners of either
machine would like to admit. I had the ST first and got
quite comfortable with it. Adapting to the Amiga took more
time then I thought. Simple things on the ST Gem interface
seemed awkward on the Amiga. I also have the Magic Sac on
my ST which gives me a feel for that desktop. Of the Three
I find the Mac to be the least user friendly, followed by
the Amiga with the Atari the most friendly.

Graphically, the Amiga has an edge but this edge is more
noticable on paper than on the screen. I have many identical
programs on both machines which when compared on the same
work bench show very small differences. Defender of the
Crown (A one time highly praised graphic program on the
Amiga) actually has better colors and contrast on the ST
then on the Amiga. I'm using a Nec Multisync monitor on the
Amiga which I feel is more than capable of doing the Amiga
justice. The Amiga version is a little cuter with its use of
hardware sprites to wave flags, and move the characters
heads in an otherwise still frame. The more impressive thing
when comparing the two is in the use of digitized sound.

The ST is also capable of digitized sound but not as
good as the stereo sound of the Amiga. The most interesting
thing about digitized sound is that it is implemented to a
greater degree on the Amiga then on the ST. The reason is
due to the Amiga's use of a double sided drive rather than
the single sided drive of the ST. This was in my opinion
the biggest error Atari made. It forced the software
developers to write their programs for a minimum system of
one single sided drive system (No room for all those nice
digitized sound files). Programs on the ST may require 3
disks where on the Amiga can fit on one. Just think what you
can do on the Amiga with three disks worth of files.
Although the ST does have double sided drives available
for both the 520 and standard on the 1040 and Megas, very
little of the commercial software is available in the

double sided format.

The bottom line is you have a tough decision and you should
do a hands on evaluation. Both machines have their good
points and bad points. Which ever are the most important to
you are what counts. Don't believe the salesman, its hard
to find one who actually knows much about both systems.

The BEST spread sheet for the ST would have to be LDW Power from
Logical Design Works, Inc. Some features include:
- Lotus release 2 compatiblility (.WK1 files) -- no need to convert to
.WKS file if you use the latest version of Lotus.
- GEM and TEXT (Lotus) interchangable interfaces
- Multiple screen fonts (condensed, regular, large (bold)) for more info
on screen and different styles
- Better performance than VIP in all respects -- scrolling, recalc, copy,
et al.
- Macro recording, macro lang. compatible with Lotus
- GDOS (for graphs, etc) + sideways printing
- and more...

$149.95 list.

Company: Logical Design Works, Inc.
780 Montague Expwy., #403
San Jose, California 95131
Fax: (408) 435-7355

DISCLAIMER: Not related to above mentioned company...

5045. Re: ASSEMBLY MOVE/CLEAR/SET/COMPARE ROUTINES (was Clearing memory chain)

Newsgroup: comp.sys.atari.st
Date: 1988-08-18 04:42:03 UTC
From: dillon@CORY.BERKELEY.EDU
Message-ID: <8808180442.AA08547@cory.Berkeley.EDU>
Source record: 251245

```
:copying 12 long words with movem (a0)+,regs; movem regs,(a1); add.l Rn,a1"
: takes 242 cycles on the 68000,
:while 12 successive "move.l (a0)+, (a1)+" takes 240 cycles.
:(timings derived from Motorola'a 68000 manual)
:when copying fewer words, move.l is even better.
:
:the move.l appoach does not require saving and restoring all
:your registers, and can be coded in C with decent compilers.

* BULL SHIT *

The motorola manual states the following for movem.l:

movem M->R, long: (An)+: 12 + 8n clock cycles
movem R->M, long: (An): 8 + 8n clock cycles
add.l D0,A1: 8 clock cycles

Total clocks to move 12 longwords of data from source to destination
in an ascending copy is: 220 clock cycles

---

move.l (A0)+,(A1)+ : 20 clock cycles

Total clocks to move 12 longwords of data from source to destination
in an ascending copy is: 240 clock cycles

move.l -(A0),-(A1) : 22 clock cycles

Total clocks to move 12 longwords of data from source to destination
in a decending copy is: 264 clock cycles

the comparison is valid because in both cases you still need the outer
DBF loop.

NOW WHERE IN THE HELL DID YOU GET *YOUR* INFORMATION ?????

Does anyone know anything about Aztec C for the ST. I am considering buying a compiler and it is between Aztec and MWC. I haven't seen any reviews on Aztec. How good is the Unix portability? (I have a feeling my program may never have a market on the Atari the way they are handling it.) How is the debugger compared to MWC CSD.

Need to know soon (Aztec has a deal ending Aug. 31)

By the way, does anyone know if Iliad Software has gone under? They haven't answered their phone the several times I have called in the last 3 weeks.

Thanks,

James A. Landay

>German be willing to translate the article to English? Help!!!!!

I did not get through to you by mail..

I'm willing to help.
I'll check out with the holder of the copyright (Heise Verlag) and than
probably mail you (via snail mail).
Interested people please write to my adress below...

The "interface" is a little board with some TTL chips interfacing DMA to
an OMTI XT controller.
The board emulates an IBM slot, mostly in software.
So this interface is not compatible with any software acessing the DMA
directly (bypassing the AHDI driver or equ.) like operating systems (as
RTOS or OS/9).
It is slower than my SH205 (when that run; broke down recently) but not
a lot.

I use Phasar for my home finance program. It's an excellent program that let's you keep track of budgets, expenses, incomes and the like. It also comes with a very good tax package that integrates with budget program.

The thing that I like most about Phasar is its user interface. It is not entirely GEM based, but it is extremely well thought out. Entering a large number of entries is made as painless as possible. Navigation through the features is logical and easy to figure out.

The next best thing about Phasar is the stability of the program. It is a fairly mature program with most of the bugs having been shaken out of it. I certainly haven't found any bugs and I've been using it for 1.5 years.

In short, I highly recommend Phasar as a home accounting package. It can be obtained from Antic publishing (look in any issue of Start for the Catalog ad). It may also be available through your local dealer or mail order houses that carry Antic software.

And the usual disclaimer: I have no affiliation with Phasar or Antic software. I'm just a satisfied user.

-> would do.

Jeff,

You probably figured this out already, but I'll send this out anyway.
Instead of using "x=-1" try "x = -1". This should parse correctly.
C originally allowed -= and =- to mean the same thing. Apparently
Laser C still let's you do this. That's why I *always* put spaces
around my operators!

5052. Publishing Partner Amateur

Newsgroup: comp.sys.atari.st
Date: 1988-08-18 14:05:36 UTC
From: silvert@dalcs.UUCP
Message-ID: <2992@dalcs.UUCP>
Source record: 251102

I just got my Publishing Partner Professional upgrade (mailed Aug. 5), and it is a total loss. Thick binder with only a few pages, one disk. Whatever you do, it crashes or hangs. Absolutely useless. Here are some of the gory details:

When you boot it up you get either inverse video (white on black) in mono or gruesome red and green on the colour monitor. There are commands to change the colours, but they don't work. Not only is the resultant screen ugly and hard on the eyes, but the various line types don't always show up very well.

I opened a column and entered some text. On the first try nothing appeared. On the second try I got some text into the window, but half of it mysteriously vanished while I was in the process of changing font size.

I started again, opened a column, and imported the distribution file BUGS.TXT. It seemed to import OK, although if you use the wrong option it crashes. Then I tried to print it -- the font turned out to be wide bold, and it ran off the edge of my page (this is a C. Itoh 8510 ProWriter). I tried to reset the font in the menu (bold, italic, etc.) but the menu doesn't work -- nothing happens when you click on on an item.

So next I opened a two-column page and imported the same text. The columns were linked, but after filling up the first column, PPP superimposed the material on what was already in the first column! So I ended up with one column of junk and one empty column. I tried to print it and got two bombs.

By the way, although PPP is supposed to come with about 6 fonts, it doesn't even have those yet -- my disk included Times, Helvetica, and Hudson. At least they dropped that stupid System font default. I don't know whether the old fonts are compatible -- I would hate to lose Courier and Symbol.

That is about as far as I got. There is no value whatsoever in using the present release. I hear that SoftLogik had to ship in order to avoid charges of mail fraud in the US, but they would have a hard time defending this product!

The only good thing I can say about PPP is that the DOC files are incompatible with PP 1.02 -- most people see this as a major flaw (as I would if PPP worked), but imagine the frustration if someone ruined a working DOC file by loading it into PPP!

Does anyone know if SoftLogik is solvent enough to provide
refunds? It is hard to believe that the company can survive a
disaster of this magnitude.

The solution would seem to be to make it a guaranteed "feature" that any program trying to use both old and new versions of the storage allocator would die horribly. This isn't so different from the present universal behavior of buffered and unbuffered io to the same device: you'd best pick one and stick with it. There's some stuff like that concerning sensing mouse button states, too, I think (is that the same as buffered vs unbuff?)

I'd like to agree with whoever it was that said you really shouldn't use the system memory allocator/deallocator enough to get into trouble with an 'improved' one, though. Library functions to manage small and/or frequent dynamic storage needs are 'friendlier' (to hardware, user and maintainer). Stuff like the arena management routines of MWC or the automatically garbage-collecting allocator that Free Software Foundation uses.

5054. GFA basic version of uudecode

Newsgroup: comp.sys.atari.st
Date: 1988-08-18 15:17:28 UTC
From: logajan@ns.UUCP
Message-ID: <759@ns.UUCP>
Source record: 251104

This is a working but unfinished uudecode program in GFA Basic.
I used it successful on a total of one out of one attempts.

It does not (yet) handle line lengths other than "M" (45 undecoded chars.)

uuencode format:

The first character indicates the number of bytes encoded into the
current line. (M=45 typical)

Thereafter three 8-bit bytes are split into four 6-bit characters.
So you have to unpack groups of four characters into three bytes.

There are two end cases left to handle:
1.) Line lengths other than 45 but ending with a three byte group.
2.) Line lengths other that 45 ending with less than a three byte group.
Good luck.

```
Dim C(45),L(61)
Input "Name of file to decode";F$
Open "I",#1,F$
Repeat
Line Input #1,B$
Until Left$(B$,5)="begin"
O$=Mid$(B$,11,12)
Print O$
Open "O",#2,O$
While Left$(B$,3)<>"end"
Exit If Eof(#1)
Line Input #1,B$
For J=1 To 61
L(J-1)=(Asc(Mid$(B$,J,1))-32) And 63
Next J
K=1
For J=1 To 45 Step 3
C(J)=L(K)*4+Int(L(K+1)/16)
C(J+1)=(L(K+1)*16+Int(L(K+2)/4)) And 255
C(J+2)=(L(K+2)*64+L(K+3)) And 255
K=K+4
Print #2,Chr$(C(J));Chr$(C(J+1));Chr$(C(J+2));
Next J
Wend
End
```

I also think that this discussion has become more useful. And to think, it
all started from a (couple) of flames... From a little flame, hope springs
eternal... ;-)

In general, I think that Atari could learn a great deal by listening to a
few of the people in this newsgroup - people who have been developing software
for years, and who have the experiences of how (and how not) to upgrade
existing software. At the root of the problem (my opinion) is Atari's
(management included) unwillingness to listen to its customers. Atari
Corp. is too busy trying to find its identity in the computer marketplace,
and in so doing has ignored the input of its customers.

>Me?!? What do I know? I'm just a brain dead poly student.

This illustrates both a blessing and a curse of the C language. To most
C compilers the following are equivalent:

```
x -= 1;
x =- 1;
```

Without the whitespace the compiler interpreted 'x=-1' to be the latter
rather than 'x=(-1)'. Try using parens or whitespace.

This also demonstates one of the possible side-effects of macros. The
following illustrates the point:

```
#define MINUS_ONE -1

x=MINUS_ONE;
```

...translated by the pre-processor to:

```
x=-1;
```

Again not what was intended.

To minimize the chance of these side-effects, always use parans for signed
numbers; especially when defining them in macros (#defines).

```
#define MINUS_ONE (-1)

x=MINUS_ONE;

...translated by the pre-processor to:

x=(-1);
```

In either case the use of whitespace not only eliminates the problem but also makes the code more readable...

```

Pardon my ignorance, but HOW can "anyone who wants them" (ie. ME) get at
them from an ftp site without ftp! My node is an ST running UUMAIL and
getting news repackaged as mail from my host system, and with a daemon
on the host posting as news any messages sent to a special user. I can
access file servers, like netlib@lakesys, via mail, but I don't know how
to get something from an ftp site. Please enlighten me.

5058. Malloc (was Re: Another great quote from Mr. Good)

Newsgroup: comp.sys.atari.st
Date: 1988-08-18 19:49:20 UTC
From: hyc@math.lsa.umich.edu
Message-ID: <402@clio.math.lsa.umich.edu>
Source record: 251108

I get the feeling that there really is no solution at this point. How can you have two different versions of Malloc/Free in the same system? Consider how this would work. Assume a new ROM with TOS and GEMDOS that use the new, fixed Malloc. Consider starting an old application from this new GEM desktop. Both memory allocators will have to be rewritten to know exactly what each other is doing, or you get programs tromping all over each other. And since you really can't change the old version of Malloc, what you're really going to have to do is write the new Malloc such that it allocates memory in such a way that the old Malloc will honor its allocations. Anything using the old Malloc will still eat up memory, will still need to be freed in the correct order or else you lose. It'd be pretty gross. Having two incompatible memory allocators active in the same system just can't be a good idea... It's not just a question of a single program only sticking to one version - it's a question of many programs being able to be loaded up arbitrarily, bearing in mind that the OS itself is probably using the new allocator.

The only real solution would have been to put in the fixed allocator and tell anyone with misbehaving code to rewrite it. Unfortunately, as Roy Good has mentioned, a lot of programs' original writers are no longer in business, so there's no way to catch everything with an appropriate update. About the only route then, if Atari put out a fixed Malloc, is for some Good Samaritan to pull out a debugger and come up with some binary patches. Not exactly a nice situation.

>Rebooted! Partition D was fried!!! Luckily I had backed up with Turtle
>the night before (great program George!) I used the BMS utility to
......
>Is there a new (safe) version of REORG?

First a comment on the specific problem:
(skip this part if you are not interested in this, more about the
status of DL II after it)

Here's the relevant part from the (never finished) DL II Manual:

- Appendix A: ReOrg, a disk reorganizer
-
-IMPORTANT: REORG IS NOT A STANDALONE PROGRAM! YOU NEED AT LEAST A
-IMAGE BACKUP PROGRAM AND A DISKCHECK PROGRAM BEFORE YOU CAN USE
-IT!
-
-IMPORTANT: ALWAYS, ALWAYS MAKE AN IMAGE BACKUP OF YOUR DISK
-BEFORE RUNNING REORG ON IT!
-
-ReOrg improves disk performance on harddisk and floppys through
-better placement of subdirectories and files on disk and through
-defragmentation of the files themselves, it will also remove
-deleted and zero length entries.
-
-As the actual reorganizing is NOT an incremental process, during
-the time from the start of the reorganization to the end of it,
-your disk is in a unusable condition (at least from the viewpoint
-of the operating system). This means, that a power failure,
-computer malfunction, disk error or program failure during the
-reorganization will leave you with a corrupted disk!
-
-To run ReOrg: backup your disk, run the diskcheck program on it
-(DL II will work ok) and ONLY run ReOrg after all crosslinked
-and lost clusters have been disposed of! ReOrg has NO protection
-against incorrect disks and will probably run into a infinite

-loop if you do not take these precautions!
-
-After you have run ReOrg and reorganized your disk, the computer
-will reboot, this is normal and serves the purpose of
-reinitializing the TOS internal directory tree.

[A file by file backup will do, it's just not as quick]

There is per definition no 'safe' version of this kind of program.

Second Part:

Now and then people ask me about updates to two programs (DLII and
ReOrg) I wrote in 86/87 and had in Beta test for a few months. The
versions were never released officialy in any way to the public (I
did allow a bit wider distribution in one case), and if people
would actually read copyright notices, it probably wouldn't have
gone unnoticed that there is no mention of free copying etc......

I more or less decided a few months ago never to distribute these
programs in an enhanced and bug-fixed form (something my personal
versions are). At the time I had two options:

- produce a very much enhanced version as a commercial
product: I decided not to do this, as it would have
ment another 6 Months or so of extra developement and
programming (6 months being optimistic), with rather
unsure financial rewards (not to mention that working
on a project also means an initial investment (you still
have to live on something) of $$$$$$ which I don't have).

- distribute it under the same terms as UniTerm: which would
have ment:
- finishing the manual (~1 months work)
(this naturally also translates into $$$$$)
- support ~1h/day for the next two years
(extrapolation from time I spend on UniTerm
plus questions about the beta test version
of DL II (you would all be suprised how many
buggy ramdisks are out there.....))
- near zero income

As neither of there possibilities are really viable, I just decided
to to NOTHING.

> supported work around.

Not use the broken procedure? What if the broken OS function is so fundamental
(say file handling, or console I/O)? What do you do then? What's the
alternatetive? You either hack around the call yourself, stupider than
anything you mentioned (but it's been done), or you live with the broken
function, or you don't write the program for the broken OS. Oh you could
use the "company supportted work around". Yea right. "Oh Malloc doesn't
work? Yes we know. Don't use it. GEMDOS console I/O doesn't work either,
but you're not allowed to use the BIOS if you want your program to
work with I/O redirection. No you can't have a larger than 16MB disk
partition. 40-folder bug? Umm.. well... Have a nice day."

Anyway I think the funniest thing about this whole discussion is that
if the Malloc bug were the worst of the problems with the ST and Atari
we'd all be in great shape!

5061. Anyone interested in GNUCHESS for ST?

Newsgroup: comp.sys.atari.st
Date: 1988-08-19 01:02:32 UTC
From: dinolt@wdl1.UUCP
Message-ID: <4120006@wdl1.UUCP>
Source record: 251111

Someone earlier suggested that those of us working on various programs report it to the net so that their won't be duplication of effort, or (maybe?) to encourage cooperation among the developers. Well, I am working (actually I have it running) on a version of GNUCHESS for the ATARI ST. GNUCHESS is a chess program developed by the people at the Free Software Foundation in Cambridge, MA. These are the same people who brought you GNUEMACS, GCC, G++, GDB, ... all for UNIX type systems.

I am fixing up the user interface a little, it will still be in curses style, NOT GEM yet. I can only test it in medium resolution on a 1 MEG ST with no new roms. I am also adding some documentation to help a user get started. I have yet to beat the program, but I haven't played CHESS in years and am very rusty, and I wasn't that good to begin with.

Should I post this to binaries? (The sources are several hundreds of kilobytes which I think is a bit excessive for the net.)

I have also ported FLEX which is a public domain version of the UNIX (TM) program LEX to the ST. Is there interest in this as well?

Responses are welcome, directly to me or to the net if you think it is appropriate.
Regards,
George Dinolt dinolt@ford-wdl1.arpa, ...!sgi!wdl1!dinolt

5062. DeskJet (a LaserJet in disguise)

Newsgroup: comp.sys.atari.st
Date: 1988-08-19 04:02:37 UTC
From: Robert.Lisowski@rubbs1.FIDONET.ORG
Message-ID: <25.230BF78B@rubbs1.FIDONET.ORG>
Source record: 251112

For the benefit of all of the people who are thinking about getting a DeskJet, but are unsure of compatibility, I offer the following:

If your software supports a LaserJet

It will work with a DeskJet
(in most cases--slower)

I own (happily, I might add) a DeskJet, and use it for everything. I used to use an Epson FX-86e, and I have had no trouble finding drivers (mostly LaserJet ones) to use with ALL of my previously purchased programs. DTP, CAD, WP, Drawing (art) programs, ASCII text, etc. ALL work just fine with this printer. The only factor you may want to consider is speed (it's about 1/2 to 1/4 as fast as a LaserJet), and possibly the ink's water-solubility, but HP assures me that they are developing a an ink that is more permanent.

I hope I have helped some people clear up the compatibility issue. At a mail order price of around $725.00, It's perfect for me--that's all I can say!

Rob

>
>There is a very simple solution to the problem of fixing things in
>the ROMS that cause bad programs to break.
>
>If you have a program that does not work with the old version of the OS
>then boot from Floppy the old version of the OS and use your program!!

This will work ... a bit.
It's OK if your program takes a long time to run (read: it is worth the
effort to reboot).
It is a problem if you have an environment in which you want several
programs to run (and you can't afford to reboot each time) of which
some old ones are bad in the above sense and some new ones are broken
by the OLD TOS and/or GEM (remember it wasn't perfect, to use an
euphemism 8-).

>Remember the Original 520ST came with a floppy that booted in the OS

Sure I do. Some of the more annoying problems were
1) the buggy memory allocation: after having started a number of programs
from the desktop you couldn't open a floppy disk icon anymore. I think
the problem was in the desktop.
2) problems with eight character folder names. When I created a folder
whose name consisted of 8 characters all files put into the folder
magically vanished. Also floppies from a friend that had this type of
folder names couldn't be read (the folder seemed empty).

Maybe Atari should redistribute an improved O.S. (e.g. the one current
in the ROMs) on floppy together with the new ROMs. Or (alternative
solution) have code in the ROMs for both old and new programs
(triggered by the date of the program); the flag old prog/new prog
could be set by Pexec and put into the basepage, to be picked up by
GEMDOS calls.

Porting gcc to the ST can be done, given enough time.
I've taken a small peek into this in the past though, and I decided not
to try this.
My reasons:
- gcc must be compiled using 32 bit int. I'm not aware of any ST compiler
which can cross compile this.
- the gcc executable is big. Forget this on a 520 and perhaps even on a 1040
- compiling gcc itself takes up more memory than my 1040 has
- but the catcher:
gcc contains a library calls to routines not available on the C
compilers/linkers I'm aware of. (think about things like system, fork
and exec).
I tried to port cpp from gcc to Minix, and that was not a trivial task,
let alone porting gcc.

(By the way: it is quite simple to port gnuchess to Minix, assuming that
you can live with the "simple" display version (no curses))

Of course, I'm also interested to know if someone is busy porting gcc (or
even better: g++). But as for now, I think I'll try to obtain the ST
version of Turbo C in Germany as soon as it comes out (rumour says
september).

From: ljdickey@water.waterloo.edu
Message-ID: <1779@water.waterloo.edu>
Source record: 251115

A few weeks ago, koreth@ssyx.ucsc.edu (Steven Grimm), announced a
file server at his machine, "ssyx", and thanked "martin@lakesys.uucp"
for the software.

I was successful in getting back the "help" file so it seems
that the server is now up.

Yesterday, someone at a BITNET site wrote to me asking how to reach
the server from his site. He is running VMS on a VAX and uses
some sort of gateway at CUNYVM. Maybe the problem he is having
is only that the server is not up or that the messages are not getting
back across the gateway. Could someone who understands the gateway
problem post a short message with examples of how to do it?

Maybe someone who has actually succeeded in crossing this gateway
this could post their experience.

It might be that things that work for "lakesys" would work for "ssyx"
too, if it is a gateway problem. Your help is appreciated.

>up with something Really Good a lot sooner.

I am just hacking on a comfortable GEM shell for ARC. It will
support calling ARC without having to use any of those command
line shells. Parameters are selected using dialog boxes etc.

It also servers as a shell for UUD so you may uudecode and
unarc all those goodies from the net without leaving the shell.
A very simple tool for renaming/deleting files and
creating/deleting folders is also included.

For now it works quite well for my personal use but still has
some minor flaws so it is not yet good enough for posting. I can
live well with them and hope I can find some time to do the
corrections. Perhaps I shall post the thing within a few
weeks. Ok, ok, if all of you want to have it earlier...

>screen, or read from the keyboard (and then only non-raw I/O).

Gemdos ctrl-c's are so to say synchronous, while you'd like them to be
asynchronous.

[some lines deleted]...
>So it seems to me that the only way of allowing ctrl-c when you're not
>doing I/O is the following:

> You could also do this in the above case.
>
> If both are redirected: read and discard raw characters from
> the keyboard, checking for ctrl-c.
>
>My question is: does anybody know of a simpler method?

As you have indicated more or less, you have to do a lot of work
yourself. Having to distinguish between redirection and no
redirection, as well as writing null characters sounds terrible to me.
Take a large calculation - little I/O - ; you would have to add
Cconws's or similar stuff throughout the code (not too few so you have
a convenient response time, not too much so the performance won't
suffer).

A year or so ago I had the same problem; solved it by using a VBL
routine. The solution was to check for control C in the keyboard input
buffer; if this was found, the return address on the supervisor stack
(pointing mostly in the user program or somewhere in the O.S.) was made
to point to a Pterm GEMDOS call. The routine distinguished between user
and supervisor mode and whether the program at hand was the desktop or
something like that. It worked most of the time; there were some
problems when trying to interrupt a GEMDOS call or something. I didn't
take the effort to solve this; maybe it's simple when taking a fresh
look at it again. The main advantage is that control-c's are
asynchronous, and your program does not have to be cluttered by dummy
console output garbage, or other magic if raw I/O is being used.

I could post/mail what I have now, or try to solve the last bugs and post it to the binaries/sources groups (will be an AUTO folder program). Anyone interested?
Leo.

B.T.W. It might also be very handy to disable/enable control C's at will (for example by keyboard control: after pressing some magic key, or by program control: after executing a special trap). This could also fix the problem of disabling ^C for inexperienced users hitting ^C by accident whilst in the GEMDOS readline function (0xa I thought it was). Any suggestions?

5068. GNU C

Newsgroup: comp.sys.atari.st
Date: 1988-08-19 16:19:00 UTC
From: jrd@STONY-BROOK.SCRC.SYMBOLICS.COM
Message-ID: <19880819161930.0.JRD@MOA.SCRC.Symbolics.COM>
Source record: 251118

I've just finished posting my port of GCC, the GNU C compiler, to the lakesys!netlib server. The posting consists of 6 ARCs; as follows:

GCX-1-23.ARC Executables (gcc, cccp, cc1, ld, gas, ar)
GCC-1-23.ARC Compiler sources
GAS-1-20.ARC Assembler sources
GNULIB.ARC Sources and OLB of the runtime library
GNUUTILS.ARC Make, LD, and random stuff
BISON.ARC Bison

There's also a blurb file that gives an overview of the whole works, and should explain which pieces you'll need for what you want to do; for instance you won't need the compiler sources unless you want to rebuild the compiler.

What's there seems to work pretty well; I've been using it (in various versions) for about 6 months. It even generates pretty good code. Read the blurb file, and look at README.ST in each ARC for details on installing and using the stuff in that ARC.

Enjoy!

5069. Re: Malloc

Newsgroup: comp.sys.atari.st
Date: 1988-08-19 17:30:00 UTC
From: gaz@apollo.COM
Message-ID: <3df48c91.52e@apollo.COM>
Source record: 251119

This is not really as big a problem as it seems. The old malloc() can become a wrapper to the new malloc() which knows how to use the behavior of the old one when it is called by the wrapper routine. Only the trap code for the new malloc() is published in header files, though binaries which call the old trap code get the former behavior. In some future release of the os, the old malloc() behavior may be deleted, though it doesn't have to if its not in the way.

This is really a case of discipline. It starts with the vendor when they publish the do's and don't's of using system calls. Please, Atari, begin to enforce this discipline on us (in a reasonable way, of course) by providing this kind of fix. We also have a strict rule on backward compatibility here at Apollo and we often use the above mechanism to get there. It increases your credibility and better code will result from developers.
(note infinite feedback loop here.)

I really hope you guys at Atari (Roy and Allan are the two names I remember) are feeding this back into your market research group. Good luck to you and us.

5070. Re: Malloc (was Re: Another great quote from Mr. Good)

Newsgroup: comp.sys.atari.st
Date: 1988-08-19 17:53:15 UTC
From: apratt@atari.UUCP
Message-ID: <1125@atari.UUCP>
Source record: 251120

I appreciate the recent wave of comments to the effect that "it doesn't make sense to have both allocators in the same system at the same time."

What I believe is missing here is a general understanding of what the new Malloc (the one in the upcoming TOS 1.4 release) really does.

The old Malloc (11/20 and Mega ROMs) used OSPool for memory descriptors, but used it VERY BADLY, and there was interference with the 40-folder bug (because folder descriptors also came out of OSPool). That's why there were limits on the number of blocks you could allocate, and the way you freed them.

The new Malloc still uses OSPool because it can't use TPA: people mess with memory they don't own, and they expect successive Malloc's to return contiguous memory. But the OSPool has been GREATLY IMPROVED. Now it is managed correctly, with reasonable allocation and freeing and compaction and so on, and furthermore it can be extended (for the use of both folders and memory descriptors) by the same old FOLDR100.PRG.

The likelihood of running into trouble with too many folders or Malloc is now MUCH REDUCED, and the fix is easy: use FOLDR100.PRG. Importantly, you no longer get mysterious behavior when you really do run out of pool: Malloc now returns zero, and folder allocations simply fail (you get a message on your screen and the system dies, but I consider that better than mysterious and data-losing behavior).

Before you clamour about "The 40-folder bug isn't fixed" let me remind you about the new definition of that limit:

1. The OSPool is statically allocated at boot time, but can be extended with FOLDR100.PRG (as many times as you like).

2. The OSPool is used for open-file handles, directory (folder) descriptors, and some other stuff (in "big" blocks) and Malloc descriptors (in "little" blocks, 1/4 of a big block).

3. The pool is used efficiently: small blocks are compacted when necessary to optimize big-block availablility.

4. A folder only takes up space in the pool when it is "active." A folder is "active" when it is:

a) Some drive's root directory,
b) Somebody's current directory,
c) The parent of some open files,
d) Being traversed during the current OS call,
or e) The parent of an "active" folder (recursively).

The upshot of this is that if there is room for, say, 40 folders in the pool, you can have up to 40 ACTIVE folders at a time. Just getting a directory listing of a folder only makes it active briefly (during the Fsfirst call, but not during Fsnext's). Then it is not active any more, and the space can be re-used if needed.

FOLDR100.PRG when used with the new TOS expands the pool for ALL its clients, not just directory descriptors.

I hope this clears up some of the confusion, and I hope you understand why we went this way rather than a "two Malloc's" approach or using a "perfect" malloc (with no restrictions) at the expense of breaking some existing programs.

From: gibson@trwrb.UUCP
Message-ID: <7665@trwrb.UUCP>
Source record: 251121

I have a Checkbook/Budget program that I wrote for the St.
This program was designed to make computer checking easier than hand
checking. This program will:

*Print on checks
*Maintain a checkbook database
*Includes a emacs like data base editor
*Flags each database transaction as a check, deposit or budget item.
*Maintain a separate list of budget items and check items
*Balance checkbook
*Perform global database editing, (i.e. change the month on a group
of items etc.)

After I add a checkbook interface to enable people to write on their
particular checks, I will post this program. I use fan fold checks.

The budget part of this program is based upon the idea that most of
my budget can be computed via my check. Actually, the budget part of
the program is more like expense monitoring. It allows each transaction
(i.e. deposit, check, or budget item) to be part of the "budget".

We're talking apples and oranges here. DOS had a huge installed base.
It was IBM coming out with the new system, not a 3rd party, and
certainly not Atari. I think one of the reasons Atari is afraid
to break any programs is becuase then they wont have any. Quite
a few of the Atari software is no longer supportted either becuase
the company went out of business or is unwilling to spend any more
resources on Atari development. This means if Atari breaks it, it
is broken forever and it's no longer something they can demo at Comdex.

The HP DeskJet follows a subset of the HP LaserJet command set. There is a
LaserJet driver to work with Publishing Partner that is included with
Partner Fonts (by SoftLogic). It works just fine with the DeskJet.

Also, you can buy an Epson (FX-80) emulation cartridge that works
great. It has worked with all software that I have tried it with.
It is slow printing sideways (for spreadsheets).

The preceeding opinions are a relection upon me, not my employer.

>community of 4000, 2/3 at work and 1/3 in home use). From my brief
>exposure to Info-Digest16, I know Atari reads these listings
>faithfully so PLEASE work hard to change your image as the VW
>kings.

Do you not see the cause and effect between the "advantages" described
earlier and these "disadvantages"? They're the same thing. While
there is excellent PD software available for the ST, it simply is
not true that this will mean there always will be. And if you want
more polished professional software, you have to attract high-quality
development bucks. Good software engineers have no dificulty making an
extremely good living. But they can't always do it in the ST market.
And eventually even the funnest machine in the world to play with
isn't fun anymore when you're not eating. Piracy is not the only
reason that developers are forced to leave the Atari ST market.
I would wager that a large percentage of full-time "professional"
ST developers (meaning they make a living at ST programming exclusively)

are untrained, inexperienced hackers. Many probably have little
or no professional programming experience with anything but 8-bit
systems and PCs. Most probably don't have CS or Math degrees -
they might have a philosophy or psychology degree. The guys
writing the PD programs in their spare time probably have more
experience and training than the average "professional" Atari ST
developer. This is becuase the experienced programmers
are being paid to do something else. Would somebody hire me
at a competitive salary to do ST programming? Probably not. Why?
Becuase there isn't any place to apply for a job. NOBODY'S
HIRING ATARI ST PROGRAMMERS, pal. Would somebody pay me a price
I feel is resonable as a software engineer for UNIX/SUN/VAX/Apollo/Mac
etc? Yes they would. So that's what I do (sort of).

The idea of inexpensive software is good. But it doesn't work
unless there is sufficiant volume. On the ST, due to in part
to piracy but other things too, the volume isn't there.
The bad thing about inexpensive software and low volume is
that no large development efforts will be undertaken becuase
no business can justify spending the bucks.

I'm not saying these things will be the death of the ST. I'm
just saying that these things contribute to the stagnation and,
until Atari does something about it, they will keep the ST out the
main-stream.

>and so on.
> -- Allan Pratt, Atari Corp.
Actually, I've always hated the way unix malloc works; too dangerous, you see, someone could easily write all over the links, then all hell breaks loose especially in a system with no protection. Why not keep the block parameters in tables somewhere else? Maybe even The Kernel could keep them in Protected Memory and thus have global memory allocation (and fragmentation). I digress...

Suggestion: Keep the Malloc tables in Malloced blocks, all chained together and squished once in a while. It makes your algorithms a touch more complicated and thus slower but you wanted regressive compatibility and who expects malloc and friends to be fast? With this method you could have a switch somewhere: Regressive Position - acts exactly like the old broken Malloc as long as possible then starts breaking dusty decks - anything that used to work should still work and some things will work longer; Progressive Position - allocates memory as efficiently as possible. Historic developers of the dusty decks will use the default Regressive Position by not doing anything; some old programs may even work better through not making silly assumptions and getting more memory out of the new, compatible, Malloc. Modern developers also do nothing and get the Progressive Mode courtesy of the latest versions of C runtime startup code, which make some new OS call.

Comments Atari? I'm no OS guru - I must have overlooked something...

I've got NetHack 2.3 working on the ST. I want to give it a little time
to settle (i.e. to make *sure* all those bugs are out) before posting it,
but it seems to be working pretty well. It's *big*, though; nearly 400K
just for the executable. Would people rather see a "pared down" version
that will run on 520's, or should we go for the full 2.3?

5078. AnsiTerm/background transfer?

Newsgroup: comp.sys.atari.st
Date: 1988-08-20 02:32:10 UTC
From: lean@sbcs.sunysb.edu
Message-ID: <1528@sbcs.sunysb.edu>
Source record: 251128

I just received AnsiTerm yesterday. It's a terminal program from
Beckemeyer Development and it supposedly does background file transfer.
I played with it for quite a while. Everything seems fine, but I can't
quite get the background file transfer to go correctly. When I try to
fire up a shell while the file is transfering, somethings it just bombs
and occasionally it would spawn the new shell, but the transfer
would halt. Has anyone used this background file transfer facility
succesfully? I use a 1040ST/Supra20Meg/Mono/Micro-Cshell

Since I need background file transfer, I gave up on this and
went ahead to order SHADOW from Antic. Anyone interested in buying this
program? (with registration card too) :-))

> Anyone else doing something they feel like talking about?

I (and a couple of friends) are working on UUPC/ST, porting it to Mark Williams C, and doing a lot of cleaning in the process. Quite a bit of the original DCP and UUPC code for the ST was concerned with adding functions that weren't present in Alcyon C, or fixing functions that didn't work in Alcyon C. We are deleting these types of functions, and using the MWC library routines.

Once this effort is done, Minix should be here, and we will try to port the UUPC stuff to Minix for the ST. That will allow us to have STs running both OSs communicate with each other, and with the rest of the (rapidly growing) UUCP network around here.

Perhaps it would help if Atari would post a list of things that broke because
of fixing Malloc. I don't know if this would violate any agreements, but
at least it might help us know who to avoid. And if they are out of business
a new opportunity exists to rewrite the products to be compatible.
I generally don't care about games, but would be interested if any
would have problems because I own a few. We don't even know the percentage
of things that broke, nor if any major packages are among these. I find it
hard to believe that very many things have this (Malloc) problem, and would
at least like to know the statistics. And Arkanoid broke on the Mega ROMS,
but I found a patch to let it. Same with Star Trek: the rebel universe.
Did that stop you from coming out with the Mega ROMs? NO!
I think that if you "fixed" the malloc bug, either the dated software
(some of which may already be obsolete) would fade into oblivion, or be
fixed, patched, or some other company would replace it/them.

5082. Re: GNU C

Use the Dumas UUX-Utility. It is a UNIX-compatibel uudecode/uuencode
utility and it is PD.

> and if I decode it on my SUN I can't download to my ST.

On UNIX-Systems, uucp or the kermit-protocol should be available.
On the ST, there is kermit and uucp too. Both are available as PD.

Maybe you should get a copy of UNITERM, the best terminal-emulator
and file-transfer-program, i know. It does vt100, kermit, x-modem,
y-modem, etc.

[Description of OSPool handling deleted]

Thanks! That will clear matters up for a lot of people. Will all that
be documented anywhere, for the benefit of developers who don't have access
to the net? Someone at Atari should collect all the worthwhile articles
like that and add them to the developers' docs, as there has been quite a
wealth of information here.

These are my opinions, and in no way reflect those of UCSC, which are wrong.

5087. turbo c for the atari st

Newsgroup: comp.sys.atari.st
Date: 1988-08-20 18:43:00 UTC
From: COBB@BRANDEIS.BITNET
Message-ID: <8808222241.AA11063@ucbvax.Berkeley.EDU>
Source record: 251137

[]

hello netlanders,

the Sept edition of C't just arrived and it seems that Turbo-C for the ST
really ISNT vaporware!

page 133 has a full page add from about Turbo-C:

Heimsoeth Software
GmbH & Co.KG
Lindwurmstrasse 88
D-800 Muenchen 2

Turbo-C for the Atari ST 191,52 DM (about 100 $)
Assembler and Debugger 191,52 DM (ditto)
Turbo-C+Assembler and Debugger 282,72 DM (about 150 $)

The ad says that it comes with a shell, various tools, supports GEM,
has IEEE floating point and does 1690 Dhrystones!!!!

If this dhrystone figure is for real then this compiler generates BY FAR the
fastest character/integer code around for the ST. Here's an amusing thought:
with the 16 MHz board from Megabyte, this compiler would do well over THREE
thousand dhrystones -- and thats about as good a rating as you can find for
a MAC-II c compiler! ;-)

> Absolutely useless. Here are some of the gory details:
> ..... etc.

By July, Publishing Partner Professinal was very much behind
schedule (at least 6 months). SoftLogik did an informal poll and the
response was that most people wanted SoftLogik to ship PP Professinal
immediately, eventhough the product was far from finished. What we all
received is a VERY VERY unfinished product. The problem was that SoftLogik
didn't make that clear in the package that we all received.

Yes, the program we received is almost totally useless. The final
product should ship within one month. With regard to the fonts, there will
be altogether 6 fonts and specific printer drivers. What we see in the
diskette we received are generic printer drivers. Hopefully, the final
package will be as good as promised. And the full manual will be sent
when the final product is ready to go. We just have to keep our fingers
crossed for now. What I don't understand is how this product got to be
7 months late and is still unfinished.

Message-ID: <28.230E70ED@rubbs1.FIDONET.ORG>
Source record: 251141

The release of PPP that they shipped is NOT THE FINAL RELEASE!!!

IT IS A SNEAK PREVIEW!!!!!

THEY SAID IT WOULD NOT WORK!!!!!

EVERYBODY KEEP YOUR PANTS ON!!!!

I can't understand WHY there are so many people out there who think this is the ACTUAL PRODUCT. IT IS NOT, and THEY SAID SO.

THAT BIG BINDER WILL BE FULL when they send the first release to you.

I know that everybody is getting impatient. I placed my order when it was first announced that the program was in development. They SHIPPED A BETA so that their LOYAL customers, who stayed with them, would get to see SOME of the features and read about others. They wanted to assure everybody that it will be WORTH THE WAIT.

A comparable program, if offered for a different machine, and done by a big company with a bunch of authors would cost $500.00 or more! But instead, there is one author, so you have to wait, but it will cost $120.00!!! Those of us who "upgraded" from the old PP only paid about half of that (the offer has expired, so it's no longer available)!

I used to be angry, but when I saw what was going into that program, I stopped getting angry, and started getting happy. THAT PROGRAM WILL BE THE BEST DTP PROGRAM ON ANY MACHINE!!! You will be able, through its open architecture, to use import and export drivers, multiple screen fonts for increased realism while using small and large characters of the same font on the screen, and other GREAT FEATURES. The program will handle ANY GRAPHICS FORMAT for import, and lets you ROTATE BOTH GRAPHICS AND TEXT.

So, INSTEAD OF COMPLAINING (you're not going to get it faster by doing that), why don't you ENCOURAGE them and tell them what features you would like to see (drivers, etc.).

I hope that everybody reading this message will tell everyone they know, who has the beta, about this message. Maybe we can calm some people down.

Rob

> I get the feeling that there really is no solution at this point. How can you
> have two different versions of Malloc/Free in the same system?

Actually, you don't need to make another Malloc, just make the current one smarter. The problem with the current Malloc is that it uses a static data area, rather than a linked list, to keep track of allocated memory blocks. This is essentially similar to the idea of file handles.

There was a version of MS-DOS once upon a time (I think it was 2.xx) that had an interesting way of expanding the number of files a process could use. The file handle pool was actually allocated in the Program Segment Prefix (PSP), which GEMDOS calls a basepage. There was a pointer to the file handles, which pointed to a 20-byte data area in the PSP, and 20 bytes for file handles.

As it turned out, a program could copy the 20 bytes to a (hopefully larger :-) data area, zero the remainder of the data area, and point the pointer to this new data area. There must have also been a datum that described how many handles were available, which also had to be updated. From that point on, the process could use that many file handles, as long as the sytem FILES parameter, set by CONFIG.SYS at boot time, would allow that many files open.

If the new GEMDOS used a "Malloc handle" pool that were relocatable in this manner, new applications that new of this feature would be able to Malloc more than the current 20 (or so) blocks, while retaining the essentially static data structures required for compatibility with the current Malloc.

Or just release the fix on disk: a little residend program replacing the
original (ROM-) trap handler.
This would be my way of releasing a fix; if it works and everybody likes
it, put it in a new ROM set.

Another solution would be a set of big ROMs containing both versions of
the system.
I put 6*27C512 in my 520ST+ to have the "old" and Blitter TOS availeble;
this is kind of expensive but useful...

Although it is better than the current situation, this woun't stop a
non-I/O process. Try to break into this program:

```
main() { for (;;); } /* now, isn't this small 8-) */
```

Since no system call is made within the for loop it will go on forever,
even if ^C is hit.

Before the weekend I promised to look into an old break version I had
laying somewhere, that used a VBL interrupt routine to check for ^C. A
problem with this scheme was that it could not always get the ^C before
a bios call did. After some puzzling I got the solution: the keyboard
interrupt vector (#$46) is changed to my own routine (in a memory
resident program). After this one has executed first the old code, a
check for the break character is done. This is an airtight way to
intercept a special character and do with it whatever you like.

The original was a C program I wrote a year ago; it has been changed to
an assembler program (this must be an improvement 8-) and mailed to
Steven Grimm today in both an uuencoded binary and a source form.

B.T.W. If you don't mind bill, signal is (2) in unix, being a system
call ((3) is the library functions department).

Simon Poole writes>
"There is no safe version of this kind of program"

This is ultimately true, but then again, you could have a random bit error tell your hard disk controller to do a format. There is a commercial alternative - in fact I wrote it, so I stand to profit from this, so the information may contain some of these biases. The program is "Hard Disk Sentry" and is available from Beckemeyer Development Tools. It is as safe as any such utility can be. First it performs a thourough check of the disk structure, and if you select optimize (It is still wise to back things up), it will do it by maintaining a correct backup image of each file, so the worst that will happen is that you will have a bunch of clusters which don't belong to any file - i.e. it first copies the images of the files to an unused portion of the disk, then it links these clusters, then it finally unlinks the original area. You can interrupt such a process anytime without losing data, unless lightning strikes your computer. And any potential errors are easily recovered from using the repair feature. I tried more than a few times hitting reset right in the middle of the operation and haven't lost a byte of data (again, the worst thing were the leftover backup images which the repair would collect into one folder which I simply deleted). *Don't try this at home*.
In short, I did most of the extra work to create a "safe" repair/optimize utility. But it is commercial and you should contact Beckemeyer if you are interested in a copy.
(Disclaimer: I have tested it extensively, but it can have problems and create trashed disks if your hardware is marginal and writing a sector from any program may not work, you cannot expect my program to recover from such instances. Also, I use it with all kinds of TSRs and Accessories including Caches, although I specifically warn against it since I can't predict what any given program will do in combination with mine. I am not claiming that it will *never* trash any disk under any circumstances, just that I have taken every reasonable precaution to prevent it in the algorithms I chose. You still should backup).

Well, since there is already a "pared down" version (ST Hack v1.03) it
isn't necessary to chop up ST NetHack. If you did "pare down" NetHack, you'd
probably end up with a lot of complaints from people who assumed the "pd" 8-)
(visual joke summary: "pared down" = "pd" = "public domain" [so much for
humor]) version was the only one available.

In article <20383@watmath.waterloo.edu> egisin@watmath.waterloo.edu (Eric Gisin) writes:
>Why do so many people think movem is faster than the
>more straight-forward loop of move.l's?

Because they may be right to do so 8-)

>copying 12 long words with movem (a0)+,regs; movem regs,(a1); add.l Rn,a1"
> takes 242 cycles on the 68000,
>while 12 successive "move.l (a0)+, (a1)+" takes 240 cycles.
>(timings derived from Motorola'a 68000 manual)

I dunno how you got your timings, but I got the following:

movem.l (a0)+,d1-d7/a2-a6 112 cycles
movem.l d1-d7/a2-a6,(a1) 108 cycles
adda.l d0,a1 8 cycles

TOTAL 228 cycles

move.l (a0)+,(a1)+ 24 cycles

TOTAL (12 times) 288 cycles

so that the movem.l construct gains you 60 cycles here: about 25% faster
(it seems you've done a bit of cycle stealing 8-).
These timings are derived by ACTUALLY TIMING them (repeating them a lot
of times and measuring the time taken). I've got a nice little program
that times a series of hexadecimal codes, anyone interested?
B.T.W. I use movem.l because movem.w only moves the lower words of the
regs (after having extended them). The adda.l may just as well be a
adda.w because it is sign extended anyway.

Note that timings on the Motorola cannot be derived from a manual,
unless you know what timing is involved with memory access in your
special case (an ST, now ain't that special). In this it differs from
e.g. the Z80 where times must be synchronous; the bus does not wait (I
hope my explanation isn't too bad, not being an hardware expert and
so). On the Motorola bus the driver is more polite 8-).

>when copying fewer words, move.l is even better.

Of course, i.e. less worse. The gain in the movem approach is just that
you do much less instruction fetching (see above: 3, be it somewhat
longer instructions, against 12). No wonder movem.l is faster.

>the move.l appoach does not require saving and restoring all
>your registers, and can be coded in C with decent compilers.

The overhead of saving and restoring registers is very little, because
we can use the fast movem.l instructions for that 8-)!!
No, seriously, if you move a large chunck, this overhead is quickly
gained back. And of course, it can be coded in assembler with decent
assemblers. As it can be in C with decent compilers (although this
involves either #asm's or executing data).

Leo.

P.S. Some people may wonder why my smiley is most of the time a 8-).
This is simply because I wear glasses 8-).
And if not so, I forgot to put 'em on, or I'm just cleaning them :-).
*-) Oops, seems I broke'em :-(

>If there is something more important than my ego, I want it caught and shot,
>NOW! (Zaphod Beeblebrox)

I wouldn't like that! Just imagine what happens when one happens to have
5 fixes on GemDos.

level 1

trap handler
if not pathed call
goto old trap
else
do own stuff
return
level 2, 3, 4, 5
same

This means that in order to get the 5th trap patch activated the system call
from a user program has to traverse FIVE trap handlers. This takes lots of
time.

Even with an efficient trap handler like the one in GemDos one does not want
to loose that processing time (grin)

Look at the way things are organized in the Macintosh OS. All system traps
are routed by a trap address table (just like in GemDos). The subtle
difference with GemDos is that the trap address table is located somewhere in
RAM, not ROM. (Well, it is copied from ROM to RAM at system boot time).

The Mac OS has two calls (GetTrapAddress and SetTrapAddress) which get and
set a trap vector in the traps table (resp).

Organized this way one does not loose a single clock cycle when a program calls a OS service that happens to be patched.

Moreover, for Atari this method is very convenient to test and distribute patches on a regular basis. (Oh well, 3 years is regular but I mean regular with a slightly higher frequency).

Yup. BTW, I've hacked hdiff (posted ages ago) to produce new-style context diffs (and made -b work).

>here, and I haven't seen mention of the source for that yet. A few people
>have casually mentioned NetHack 2.3. Has a bug fixed version ever appeared?
As far as games are concerned, I've a robust version of Nethack 1.4.
Other ported game postings include robots, world, advsys and adl. Please note that this version of adl supports >64K of code space. Go ahead, dig a deep dungeon...
Sooner or later, I'll tackle warp.

>Other things I'd like to get working are GNU Make and RCS. (Which would
>require working versions of diff and diff3, at least.)
I'm about to release a clone of RCS. Well, it doesn't know about revision trees and there's no equivalent of rcsmerge, but about everything else is there.
Other things I've ported include compress (true 16 bit) and sed (taken from comp.os.minix). People around here are working on bison, flex and perl.
BTW, there's yet another undocumented MWC feature: try "diff -e foo bar".

Markus Weber UUCP: ...!uunet!unido!uklirb!incas!weber

PS: I'm using MWC (usual disclaimer: I'm nothing but a very satisfied customer...) and everything mentioned above will run in connection with MWC's msh or (probably) gulam.

5103. New ST ROMS (and breaking old applications)

Newsgroup: comp.sys.atari.st
Date: 1988-08-22 08:41:59 UTC
From: gert@nikhefh.hep.nl
Message-ID: <525@nikhefh.hep.nl>
Source record: 251153

To Allan Pratt (are you listening????)

Would you mind telling the net which applications would break when Malloc is fixed?

If old software breaks when Malloc is fixed, did Atari tell the developers of those applications that their applications go bezerk on a fixed OS?

Why shouldn't serious developers have their software fixed in a reasonable amount of time? Or is it that Atari does not want to loose applications of companies that gave up the ST line long ago??

I believe that the OS should be fixed NOW, without looking back at all the fancy stuff from companies that have gone out of the ST business. Atari won't loose any important (read business [that's what atari is aiming for eh?]) applications: serious business applications are served better by providing a reasonably well performing OS than support for backward comaptibility with an OS that has so many weak areas.

And PLEASE, do provide documentation with it. Something like 'Inside ST; telephone book edition' like for the MAC is what is needed. Look what chaos is created now: lots of books are available for GemDos and all other parts of the ST's OS. And all have sections in them that tell people that such and such undocumented feature works this way or that way.

Atari should document it's OS (BTW they promised to have docs 2 years ago; some outside company would do that; did that company drop the ST line too??) and boldface print that 'this is what this call is for, and nothing else'. If Atari does not do that you're bound to end up with ill behaving programs. (Look for example at the old 'db' debugger of Mark Williams Co.: that didn't work right on Mega roms because they had to do things that could not be done with a system call, so they had to use some undocumented features...)

I don't think that developers are to blame for that (e.g, if I want to get the current settings of the serial port and find that there is no call in the OS to get me that information, I simply have to dig that out of the Hardware): if there are OS calls to get something done developers will use that, not their own work around.

And PLEASE, don't say that the OS is documented in the developers package. Even the GemDos 'manual' that goes with it contains bugs.

5104. StuffIt on Aladdin/Magic Sac

Newsgroup: comp.sys.atari.st
Date: 1988-08-22 10:01:45 UTC
From: paulm@nikhefk.UUCP
Message-ID: <410@nikhefk.UUCP>
Source record: 251154

Thanks to all people that responded to my request regarding Atari
file servers. I got what I wanted!

I can return the favor ;)

A friend of mine has an Atari ST and he uses the Aladdin/Magic Sac
software frequently to emulate a Macintosh. He used to download
a lot of Macintosh PD software, but since StuffIt hit the scene as the
standard compressing utility, he is out of luck. StuffIt fails to
work on both emulators (so I was told).

I tracked down the cause of StuffIt's crashes and concluded that the
program wants some resources that are not available in the Mac System files
that these emulators use. If you want StuffIt to run, you need to get
hold of a friend with an original Macintosh, using System set 5.0
or later. Grab ResEdit and copy the following resources from the System
file to a new file on disk:

CURS (pretty sure you don't need this one, but Justin Case ;)
LDEF
MDEF
PACK

Transfer the file to a Magic Disk and copy the resources intito the
older system of the Magic Sac/Aladdin emulator.

StuffIt should now work like a dream. Now you can download all of
that Mac PD software and triple your telephone bill ;)

5105. 520ST : 2 urgent though simple questions

Newsgroup: comp.sys.atari.st
Date: 1988-08-22 10:47:47 UTC
From: lily@kulesat.uucp
Message-ID: <165@bach>
Source record: 251155

Hi there,

Can anybody give me an answer to the folowing two
simple (? to a ST-owner maybe) questions.

Intro : A friend of me owns a 520 ST and wants to know :

1. How can he expand the memory of his ST to 1024k, or higher.
(which chips, at what price, where to put them
-I've seen the RAM-chips soldered to the board = no sockets,
can he use 1Megabit chips etc...)

2. Can he use a serial printer without a Par-Ser. interface.
(what about the modem port ? -any software?-, what about
buying an interface : prices,manufacturers etc...)

Please, if you have some answers or recommendations, answer to :

You might want to try out UUMAIL (PD UUCP/UUCICO/UUX/MAIL/ETC all
rolled into one PD program for the ST.) It makes the ST into a
networking UUCP host (i.e. you don't have to just be a leaf node).
We are using it locally in Minnesota within a network of about 14 ST's
connected to several Unix sites (stag.UUCP for most of us). With the
'cron'-like program that one of our developers wrote, you have pretty
much the same functionality for mail and news<->mail forwarding that
a Unix system has. Plus UUMAIL can even be polled by a Unix system if
necessary, since UUMAIL runs in host mode with normal Unix
login/password/Shere prompts...

The only thing currently missing is a port of news 2.11 and rn over to
the ST (along with batching and all the necessary utilities for moving
and managing news).

> AES resources)

Ken, I'm really with you--anything worth doing is worth doing right. Unfortunately, "right" is subjective. In my opinion, fixing broken code is the most "right" thing to do in this case. The next most right thing to do is maintaining backward compatibility (hey, I develop and support software for a living, too!) Further down the list of "right" things to do is adding new features. We all love them but making (and keeping) programs working is more important--features can be added by giving coding examples in books and on disk. This is my opinion, I hope you and the management at Atari will agree.

Request for statistical software source code in C or Pascal

If anyone has any statistical software which they know is
"public domain" or have some of their own which they are willing to give
please send or contact me at the mailing address below.

Simple commonly used statistics would be best. Something in the vein
of MINITAB would do quite well.

It is intended that any suitable software will be converted for use
with a spreadsheet program which is to be made freely available at source code
and executable file level. It is currently being adapted from Unix to PC using
Turbo C, with plans to port to the Atari ST in the very near future.

I own the MWC compiler version 3.0 and worked with the Aztec C compiler on
the ST as well as on a Mac II.

You should definately buy MWC. The CSD debugger is excellent and the compiler
itself good. The Aztec C compiler is bug ridden. Having found some code
genrator bugs while working with Aztec on a MacII I tried to reproduce these
bugs on the ST version. And guess what? Same compiler->> same bugs; even
though I had already reported them to Manx (the company marketing Aztec).

This simple one liner crashes the Aztec C compiler on the ST (address error):

```
main () { *(int *)1 = 0; }
```

Compilers that crash when compiling this I do not trust anymore...

Go for MWC: it well worth the money.

> For the benefit of all of the people who are thinking about getting
> a DeskJet, but are unsure of compatibility, I offer the following:
> If your software supports a LaserJet
> It will work with a DeskJet
> (in most cases--slower)

Make sure, though, that what it supports is a LaserJet and not a LaserJet Plus. The Plus adds support for downloaded fonts and a bunch of other things that the DeskJet does not do, at least not in the same way. Also, demand a separate DeskJet driver from your software vendor; the puppies are popular enough. Why? Because there are a bunch of tricks you can do to make the DeskJet faster, maybe up to a factor of two or more faster, that you wouldn't do for the original LaserJet.

Oh, everything above I've said about the Plus goes for the Series II as well. And I'm not convinced that even the original LaserJet doesn't have some features that the DeskJet doesn't do right.

Good luck; it's a fun little printer, that's for sure!

> {portal,ames,imagen}!atari!kbad | So, y'know, don't bug Atari about it.

Now if you need more room in the ROMs how about this:

- Kick the desktop and AES resources out of the rom
- same goes for the bios keyboard translation tables
- Even kick out the desktop program itself.
And supply these on disk, to be read at boot time.

What you gain is substantial (I think):

1. Lots of valuable ROM space, which can subsequently be used for a real part
of the OS. (And a user interface is NOT part of an OS).

2. You don't need different ROMS for different countries. This will yield
a substantial costs cut.

3. The desktop resources can be modified to everybodies liking

4. And it provides a way to easily upgrade the desktop.
(or users can even directly replace it with a command line shell, if they
like that better)

I'm sure everybody can think of additional advantages...

5112. Personal Pascal question

Newsgroup: comp.sys.atari.st
Date: 1988-08-22 17:56:00 UTC
From: MCCABE@MTUS5.BITNET
Message-ID: <8808230057.AA13653@ucbvax.Berkeley.EDU>
Source record: 251162

Date: 22 August 1988, 12:36:14 EST
From: Jim McCabe MCCABE at MTUS5
To: INFO-ATARI16 at SCORE.STANFORD.EDU
Subject: Personal Pascal question

This is directed to people who really know a lot about Personal Pascal, or
those who have written huge programs in it.

Today, while rewriting the editor in a BBS of mine, my source code
stopped compiling. The compiler gets to the last line of the file
("end."), and stops with the error

Too many external references

So, I looked through my entire Personal Pascal manual for some information
about just what the limit IS for external references, and it doesn't say
anything about them. Here's my situation:

I have declared:

305 constants, plus those in GEMCONST.PAS
(I use a very large resource file)
28 types, plus GEMTYPE.PAS
97 global variables (I *have* to use them, or else each
procedure would have huge parameter lists --
believe me on this...) containing:
6 file variables
17 dialog box pointers (Dialog_Ptr)
1 menu pointer (Menu_Ptr)
8 external functions or procedures, all global
15 TOS function declarations, all global
6 pointer variables, all local to one procedure

Now the weird thing is, I have had the 8 EXTERNAL routines and the
15 TOS routines declared for months, and it's always taken them until
today when I changed my editor so that it uses pointers instead of
a big array. The editor routine even compiles beautifully, and the
error pops up on the last line of the main program.

Has anyone else experienced this error? What *is* the limit on
external references? (By the way, I'm using version 1.x, NOT one of
the newer version 2.x compilers...) I'm going to make the file
variables local, since those use pointers too, but still, the
error doesn't make sense.

I don't think Personal Pascal handles external referrences well
in the first place. For one thing, when I try to link together

a few really large modules, the compiler always "forgets" to
link a couple of the files (seems random), and it also screws up
some of its own internal variables. For instance, it will give
me a linking error, saying that the function "bssanf" is undeclared.
My program doesn't use any function bssanf. :)

Does anyone have any ideas on this? Maybe the new version of
the compiler works better, who knows.

> [stuff deleted]
>==========================================
>Opinions expressed above do not necessarily -- Allan Pratt, Atari Corp.
>reflect those of Atari Corp. or anyone else. ...ames!atari!apratt

Allan,

To my knowledge there is another reason that a folder can become
'active'. And this is the MOST IMPORTANT reason that the 40 folder limit does
exist:

Whenever a program performs a Fsfirst and does not 'run to completion'
using the Fsnext call you will get the following datastructures:

Owned by the program Owned by GemDos

DTA structure:
```

21 bytes OS owned stuff
therein: a pointer ---------> active folder data structure
(on an odd byte boundary,
the orginal TOS author really
had a way of coding)

rest usable (Read only)
by program: attribute, filename
time stamp and file length

The folder into which the program does its search using Fsfirst becomes active (its being searched, right?). Now in GemDos there is no backward referencing pointer, i.e. a pointer from the active folder structure to an active (not yet completed) DTA search buffer.

When the program exits, GemDos has no way of knowing whether the active folder may be removed or not. THIS IS THE REAL REASON FOR THE 40 FOLDER BUG.

And the same program may reset (using Fsetdta()) the current process dta address and start creating a whole mess of 'active' folders that can never be cleaned up by TOS.

And since there is no equivalent of the UNIX 'stat' call in TOS you are forced to do an Fsfirst to get info on a file. Even if you allocate 1 megabyte for folder structures in TOS memory it still will become depleted!! FOLDRXXX.PRG won't help and FOLDRXXXXXXXX.PRG won't help either.

IS THIS FIXED IN THE NEW ROMS????

Hello out there,

Have any of you serious ST hackers attempted to build a switchbox that will allow you to switch between a monochrome and color monitor without unplugging cables?

I know that somebody sells one of these things for about $50, but It seems like the type of project that shouldn't be that difficult for someone with a minimal amount of guts and skills with a soldering iron (you don't have to worry about frying ICs).

If anyone has any experience or suggestions regarding this type of project (Parts required, etc) please email me and I'll try to put something together to post to the net.

> but you're not allowed to use the BIOS if you want your program to
> work with I/O redirection. No you can't have a larger than 16MB disk
> partition. 40-folder bug? Umm.. well... Have a nice day."

1) Most development systems for the ST provide alternatives to the
system Malloc call which work just fine. Workarounds were published
in one of the earlier Developer Q&A newsletters. (also, see Allan Pratt's
recent posting regarding how Malloc has been repaired for TOS 1.4)

2) If you need GEMDOS console I/O that is redirectable in earlier
versions of TOS, you can use Fread/write to standard handles. It redirects
just fine. (also, GEMDOS console I/O is redirectable in TOS 1.4)

3) No, you can't have a larger than 16MB disk partition. However,
when AHDI that supports removable media drives is released, it is possible
that close to 32Mb partitions will also be available.

4) Quite some time ago, Atari released to public distribution a program
called FOLDR100, which increases the amount of OSPool, and helps relieve
nearly all instances of the "40 folder bug" (q.v. Allan Pratt's recent
posting regarding how Malloc has been repaired for TOS 1.4).

5117. I need Binhex in MAGIC format

Newsgroup: comp.sys.atari.st
Date: 1988-08-22 19:16:11 UTC
From: lommen@hrsw2.UUCP
Message-ID: <122@hrsw2.UUCP>
Source record: 251167

Greetings,

I've finally bought myself a magic sac [just in time to find out a
128k version is coming out :-( ] and I'm looking for a way to get
"bootstraped " so I can start downloading some of the mac s/w that comes
across on the net. I need a copy of binhex and a communications program in
magic format so I can xfer mac binaries from the unix machine I use at work
directly into magic format files on my machine at home (using xmodem or
kermit).

I don't have ready access to a MAC at home to transfer files using
the Magic Sac cable, but the MACs at work are networked to our UNIX box,
so if I get binhex, and a communications program, I'll be able to transfer
files to magic format over the phone.

If anyone out there would be generous enough to help me, email me and
we can arrange for me to send a disk and return postage to you.

Alternatively, can some one give me the address of someone who sells
PD MAC software on MAGIC format disks?

My uucp address is: uunet!pilchuck!apcisea!hrsw2!lommen
uw-beaver!ssc-vax!shuksan!tahoma!hrsw2!lommen

Thanks in advance to anyone who responds.

The REAL question, for those of us without hands-on-experience with the
HP deskjet is:
Does it produce a full page of 300dpi graphics, when a 'plain' laserjet
would scream out of memory and spit out a page with approx 1inch of graphics?
A laserjet is fairly useless for graphics because of this...
I don't think the deskjet should do this, as it can control the linefeed
and wait for more data, and continue printing.... without feeding the same
sheet through again, and again, and again.
Of course, its slower.

5119. Desktop bug?

Newsgroup: comp.sys.atari.st
Date: 1988-08-22 21:10:18 UTC
From: dragon@olivej.atc.OLIVETTI.COM
Message-ID: <27617@oliveb.olivetti.com>
Source record: 251169

I have discovered what I think is a bug in GEM/GEMDOS (so what else is new, right?). I haven't heard of it before, but it's not too serious anyhow.

It happens on my Mega 4 and my 520STfm. I haven't tried it on any older systems since all of mine are gone. Here's what happens:

Boot system.

Place a disk with folders on it in a drive and open the disk.

Now you should be greeted with an open window with a directory that has some folders listed.

Remove the disk from the drive, but leave the window open.

Drag one of the folders to the trash.

The drive will spin, but there's no disk in it.

An alert box will come up, saying that there's no disk in the drive, [CANCEL | RETRY]

If you cancel, the system crashes (two bombs sometimes, reboot sometimes, sometimes both).

This is *very* repeatable.

Has anyone noticed it before? Will it be fixed in the new (newer than Mega) ROMs? Has it been fixed in the Beta ROMs?

Message-ID: <6356@chinet.UUCP>
Source record: 251171

I said I'd send koreth the umoria executable about today, so I'd like to make my excuse for its present status. I hope to fix the last bug I'm aware of tonight. The program works well enough for me to have done more than 30 hours of 'testing' in the last week. (this delayed completion both in the obvious way and by turning up a few small buglets). So it'll be out soon, I promise.

In connection with Howard Chu's suggestion that we tell what we've got coming: I've been working for about 10 months on a Mandelbrot set drawing program. It iterates 10,000 times /second with 30 bit accuracy, runs under GEM in all resolutions and saves pictures in DEGAS format (with a bit of visible header). I'm inclined to post executable as a freebie, and ask for a bit of money for source and future upgrades.

randy asked us to get out the word that chinet is just chinet again, chinet.chi.il.us just didn't work out (don't know why).

[rest deleted]...

To show that I'm not making things up, I quote from 'Programming the 68000'
by Steve Williams (edition by Sybex), page 357, Exception Processing
(hope I'm not sued for copyrights, but then, this is for educational purposes
only 8-):

---------- start of quotation ----------

Single-stepping an instruction involves setting the Trace bit in the status
register. The most common method is to stack the Program Counter and
status register, set the Trace bit in the stacked status register, and execute
an RTE instruction. A trace exception will occur immediately following the
execution of the target instruction. Some side effects of this technique are:

o Since an exception clears the trace bit, an exception caused by
the instruction being traced causes the debugger to lose control,
unless the debugger receives control when exceptions occur.

o TRAP instructions that call an operating-system function appear
as a single instruction.

o Tracing an RTE instruction causes the debugger to lose control
because the RTE instruction reloads the status register. Tracing an
instruction which reloads SR has the same effect. These instructions
include MOVE to SR, ANDI to SR, and EORI to SR.

o Tracing a MOVE from SR can cause the program to malfunction because
the trace bit will be set in the copy of the status register that
the program receives. If the program compares this copy without
masking the trace bit, it could execute incorrectly.

---------- end of quotation ----------

I should say this contradicts what Allan said. I'm not saying who's right
or wrong, but I'm getting curious at the *REAL* facts.
Note also that I never said single-stepping trap handlers couldn't be
done; however, after reading this quote it seems not trivial. If you
don't take precautions (i.e. let the TRAP be vectored into the
debugger) the trap handler code is executed untraced; the status word
with the Trace bit set is reloaded from the stack when the RTE takes
place, causing a Trace exception at that point (the program counter
will point after the TRAP instruction). At least this is what I make
of it!

My own experience with a code debugger for the ST (sid.prg) is that it
indeed performs a TRAP as if it were a single instruction (i.e. not single-
stepping the code within the trap handler); why this was just so isn't
clear now.

Any 68K experts care to comment on this one; I'm especially interested in
Allan's reply.

Leo.

The ST's trap vectors are in RAM, too. In fact, I don't know of *ANY* 68xxx box that doesn't have them in RAM. Their locations are down in low memory ($60 or thereabouts, I don't remember exactly...) You have to be in supervisor mode to write to them, but they can certainly be changed. I've done it lots of times.

>The Mac OS has two calls (GetTrapAddress and SetTrapAddress) which get and

Try looking up Setexc() in your XBIOS manual.

These are my opinions, and in no way reflect those of UCSC, which are wrong.

From: rokicki@polya.Stanford.EDU
Message-ID: <3694@polya.Stanford.EDU>
Source record: 251174

Yep, the DeskJet can print an entire page of 300 dpi graphics, but slowly. You see, in graphics mode it seldom uses the full printhead; typically it only uses five or seven jets on each pass. And there is enough memory in the basic box to buffer an entire row (50 pixels high by 2550 pixels wide is only 16K.) The expansion RAM helps this situation exactly *zilch*; apparently the expansion RAM is only good for downloading soft fonts. These soft fonts have some rather interesting (distressing) restrictions themselves.

Still a fun printer, I just wish to hell they had done it correctly instead of the half-assed way they did. Hell, all they had to do was take the LaserJet Plus guts and make them drive the ink-jets. Maybe they could have changed a few things to add full-page graphics. But now we have another set of incompatible drivers, font cartridges, etc. But there's no understanding the corporate mind.

Don't tell me there were technical reasons. That's bullshit. Just wait until someone comes out with a DeskJet emulation cartridge for the DeskJet, just to print those damned graphics faster. (It's possible. Probably even easy.) Or perhaps an HP LaserJet Plus or Series II emulation cartridge, which is what the printer should have been.

Third edition of the Motorola 16-bit microprocessor user's manual.
It is dated 1982. On page 203, movem r->m (long) is 8+10n cycles.
I guess my sources are obsolete.

Anyone know when this changed to 8+8n cycles?

Yes. Atari, please _Excite Me_ once again; build a 68030 box or something.
It's hard to maintain momentum on a 68000 based box obsessed with the past.
Our institution (a university, charged with moulding the minds of poor
sob's (read "students")) doesn't really think your stuff is very interesting
anymore. Honestly, any 80[23]86 box is more interesting from an academic
viewpoint, especially if aforementioned academic is trying to use the
box as a platform for CAI or CAL delivered from a central server; where's
the equivalent of Sun's PC-NFS ? Replies of 'well, there\'s Moses\'
Promise-LAN' will be met with derision (not my own; the users can manage
some things quite handily on their own ;-).

And further more, you can't argue that you're working against a huge
retroactive force (an arguement that I*M can use with perfect sincerity).
Really, my impression of the installed Atari {520,1040} base is twofold:
games fiends, who run the same binaries _over and over_, and who don't
know Malloc from SetPhysBase (:-), and very knowledgable hackers to
whom a change in memory allocation semantics would be an upgrade, not
an obstacle.

ps (to Allan Pratt): since I never mentioned an implementation,
but only an implementation _strategy_, I feel that your comments re 'But
that won\'t work' et c. are a little bit premature; I never specified
how it would work, only what the GOALS were. At the same time, I don't have
the exhaustive knowledge of TOS innards that you have (painfully ? :-)
mastered; maybe there's no way. But believe me, I _did_ spend some time
thinking about implementation; p'rhaps we should talk? (Not really;
I'll bet that in the long run your hacks will do beautifully).

>Does anyone have any ideas on this?

Two things to look at:

1. The +E compiler switch, if I remember correctly, causes ALL global symbols to become external. I think it is on by default. Since you have so many global symbols, you might want to try turning it off and explicitly declaring just those you need.

2. You can get by with only one global variable by defining a record with 97 fields and having one global variable of that record type. But a much better style is to organize them into related groups of variables, and to make each group a structure with an associated global variable of that type. This should make the program much cleaner and easier to maintain. Having done so, you might then decide that it is no longer so onerous passing around these structures as VAR parameters and get rid of the global variables altogether!

I understand that viewpoint, but I cannot go along with it. The core of
the philosophy of fixing the OS must be this:

When at all possible, don't make happy people/programs unhappy.
In light of this, when possible, try to make unhappy people happy.

I think we have done this. See my previous article (manifesto) on
Malloc. It shows that we (I) put a lot of effort into making Malloc
compatible but also much improved. I think we (I) succeeded.

OK, OK I did not make my point very clear. (And Yes, I do know 680X0 boxes
that have their trap handler addresses in a ROM).

What I meant is this: In the Macintosh OS calls are implemented by whole
lotta line A trap numbers. This takes one single word in a program in order
to call the OS. The trap word looks like 0xaXXX, where the XXX represent the
number of the system call actually requested by the caller.
It is this 12 bit number that is used as index into an array of pointers

THAT'S THE TRAP ROUTINE ADDRESS TABLE I MEANT IN THE ORIGINAL POSTING.

This array of pointers to OS routines is located in RAM on the Macintosh.
So what the OS routines GetTrapAddress and SetTrapAddress actually do is
returning (for Get) an entry from the array of function pointers or modifying
(for Set) one single entry in this array.
FLAME ON
Of course I know the Setexc() call: but its essentially different from
Get/SetTrapAddress in the Mac!
FLAME OFF

The whole idea behind all this is that they (Apple) can now apply patches to
roms from the 'system' file. (I think it's the PTCH resources in it). They
don't have to order a whole new shipment of ROMS when a bug is discovered.

They can just replace the erroneous OS routine.

If Atari would do things this way (and I doubt there is any look/feel involved) you could easily work with different versions of Malloc() in the same system.

5134. Novation SmartCat 1200 baud modem (need manual)

Newsgroup: comp.sys.atari.st
Date: 1988-08-23 17:35:04 UTC
From: rchampe@hubcap.UUCP
Message-ID: <2821@hubcap.UUCP>
Source record: 251187
Cross-posted to: comp.dcom.modems,comp.sys.ibm.pc,comp.sys.mac,comp.sys.atari.st,comp.sys.apple

This is really a shot in the dark, but I have a Novation SmartCat modem that I bought about 6 years ago and lost the manual to it 5 years ago. Never was a problem till last year, because I knew how to do the important things like set the baud rate and dial. Last year, however, I started calling our VAX and discovered that my modem seemed to be changing the parity and the VAX didn't like that at all. After starting with "%A" and working towards "%Z", I found the command to make it compatable with our VAX to be "%F 3". God only knows what that stands for. Now text works just fine, but Kermit keeps timing out with my modem, but not with a friend's, and I can't get it to communicate with our NAS mainframe. I'm just short of saying the hell with it and buying a new modem, but I figured I'd try this first. If by any chance someone out there has a manual for it, could you please EMAIL me a list of the commands and the DIP switch settings (I've been afraid to even touch them).

Thank you,

Rich Champeaux

This is a _great_ idea! Then puntaes would work again too. There
would be lots of room in the ROMS for OS and you could put GDOS right in
the AES. Have you thought about this, Atari?

5137. A scheme for updating/patching gemdos

Newsgroup: comp.sys.atari.st
Date: 1988-08-23 20:53:34 UTC
From: gert@nikhefh.hep.nl
Message-ID: <531@nikhefh.hep.nl>
Source record: 251190

I seem to have created a bit of confusion with my posting to this group
on how system calls may be patched in GemDos if Atari were to adopt a
slightly modified system call trap handler.

In my original posting on this subject I referred to the method used in the
operating system of the Macintosh. Let me explain how this method works.

Assumptions: 68000 (or 68070) system (not an 68010/20/30)
Rom located at addresses 0x0 through 0x7 at reset time and
shortly thereafter (reset program counter and initial supervisor
mode stack pointer are fetched from these addresses)
Ram locations 0x8 and up
Operating system in Rom somewhere high up in memory.

This description fits
the Atari 520, 1040, Mega 2 and 4, and
the Macintosh 512K, Plus and SE.

A user program may call the operating system for some service by issuing the
appropriate trap call (i.e. on the ST trap 14 for Xbios, 13 for Bios, trap 1
for GemDos and trap 2 for GEM; and one of the lineA emulator calls on the
Macintosh).

All these calls cause the 68000 to fetch an exception processing vector (the
address at which the OS trap dispatcher starts) from low memory in the
address range 0x8 throug 0x3ff. The address from which the exception vectors
are fetched are fixed on the 68000 (though not on the 680[12]0 which have a
register called the Vector Base Register which holds the start address of the
exception vector table).

On the Atari ST the process calling the OS must have pushed an operation code
for the requested system call onto the active stack prior to executing the
trap. This operation code (the number of the system call) is used as an index
into a table of addresses. This table holds the addresses of the first
instruction for each system call. Hence the assembler code in the OS
dispatcher could look something like this (oversimplified):

```
OSEntryPoint:
move.w opCode(sp),d0 # get operation code
lea dispatchTable,a0 # get dispatch table address
movea.l (a0,d0.w),a0 # get pointer to requested function
jsr (a0) # jump to requested function
<do cleanup and return to caller>
```

On the Macintosh user programs do not issue a trap instruction to get to the
operating system. Instead they incorporate an unimplemented 68000 instruction
into their program. This unimplemented instruction starts with 0xa and is 16

bits wide. The lower 12 bits of that word encode the number of the system call (hence the Mac may have 16 times as many system calls tied to the same exception vector as the ST). Whenever the unimplemented instruction (line A instruction) is executed (well, only decoded by the 68000 instruction decoding logic) the 68000 starts exception processing in much the same (though not exactly the same) way as when a trap instruction is executed.

The Macintosh operating system uses (schematically) the same trap dispatcher routine as the ST. The ONLY difference is the address of the 'dispatchTable' variable shown in the assembly example above.

On the ST the dispatchTable is located in ROM, on the Macintosh it is located in RAM (low memory address). Sure, its safer to have the dispatchTable in ROM, you would say. True, it cannot be overwritten by a program going nuts. However, having the dispatchTable in ROM has one major drawback (and, consequently, having it in RAM has an advantage).

When an operating system routine is found to contain a bug (e.g. Malloc and others on the ST) and the dispatchTable is located in RAM it is quite easy to fix the erroneous routine.
During system startup a patch for the erroneous routine could be read from disk and be applied by placing the new routine in RAM and have the appropriate pointer from the dispatchTable point to the newly loaded routine instead of the erroneous one in ROM.

On the Macintosh two routines exist to manipulate the dispatchTable. They are: GetTrapAddress and SetTrapAddress. GetTrapAddress is used to get the start address for a certain system call service routine from the dispatchTable. SetTrapAddress is used to change the value of one of the entries in the dispatchTable. SetTrapAddress is used by the resources of type 'PTCH' in the Macintosh 'System' file, which are loaded into memory as soon as the system is bootstrapped. Normally (at least in the more recent versions of the System file), there are PTCH resource for all kinds of Macs: the patches may be applied to different roms (remember there are 3 differently sized roms in Macs: 64KB(old Macs), 128KB(Plus and SE) and 256KB (MacII)) and to different rom releases (there are at least three different rom releases for the 128KB version alone) and for different hardware configuarions (Note that the Plus, SE and II have an NCR SCSI controller while the older 512K Mac does not). In each case the PTCH resource, once loaded into RAM, finds out all it needs to know for deciding whether or not to apply the patch.

All this is made possible by one simple fact: the dispatchTable is located in RAM.

With my original posting I intended to explain this to the net, and I wish that Atari would adopt such a scheme in the next ROM release. It makes upgrading the OS so much easier since you don't need to ship new roms every once in a while when a bug is found...

But at least they are beginning to show some signs of changing.
Even though 99% of the recent articles from atari have been vigorously defending the status quo, at least they are posting on (and presumably reading?) Usenet. That's good for the "unofficial" developer who can't afford the premiums to get onto services like Bix or GEnie. Add to that some of their recent hirings (kbad, for example) and the atari node on the STadel network and it begins to look like a little bit of light is beginning to dawn in someone's* head in Atariland.

It's a lot easier to put up with gemdog when I know that Atari may actually be listening to complaints from -any- user of the machine.

versions on all* versions of the roms <

Evil spirits, I'm afraid. When my ST was alive, I only tested
against my configuration; when my ST was dying, I didn't have a
keyboard or monitor and needed to play with the system attached to
/dev/tty01 (the serial port) [let me tell you how much fun it is
trying to debug a BBS when the OS doesn't have a stderr defined];
and now that the ST is dead (another motherboard on the heap of
dead computers killed by my proximity) I can only do debugging when
I borrow a ST and port the code over from my PC clone.

The most common 3.3 ST bombfactories seem to be if you are
blanking string fields out in your ctdlcnfg.sys by doing "" -
`#shell ""' seems to be a good offender for that - or if you are
#define'ing TIMEOUT and/or HOUROUT. Killing those things should*
cut down bombing quite a bit.

[Don't reply to me here, please - my Usenet access is spotty
these days, due to 3.3a/3.3b debugging and my inherent laziness
about everything except citadel. If you can get onto the STadel
network (the STadel: room) or Bix (js.online/stadel), I'll be able
to reliably answer questions and put out brushfires. Calling Pell
will probably work, too.]

Right. We're s'posed to BELIEVE this? What you're really saying is
you don't have the manual because it's PIRATED, right?? Oh, it's easy
to say "I bought it and lost the manual", but we all know better. And
now you want US to assist you in your disgusting crime, well I for one...

...did you say "modem"? Oh... that's hardware, isn't it.

From: ggroup3@charon.unm.edu
Message-ID: <3555@charon.unm.edu>
Source record: 251195

I've had my ST for 2 years now. I've bought quite a few things for it;
expanded the memory from 512 to 1024, added a battery backed clock,
a couple programming tools (Personal Pascal and Mark Williams C), and lots of
games.

I like the idea of fixed ROMs and making them compatible with old software.
I am a college student who bought my ST on the Student Discount that
Atari offered me back in '86. I'm a computer science major at UNM, where
they use 10 1040 ST's in the Assembly language class (Assembly on the
M68000). I was thrilled when I found that out - doing most of the
programs on my system at home.

I'm glad Atari has decided to go with a compatible OS. I'll want it in
my machine for sure AND I don't want to have to shell out tons-o-bucks for
my broken software.

Now that's what I call power without the price. Thankyou Atari!

(Better make it soon - I want my Blitter, too, damnit!)

Actually, FOLDR100.prg does better than what MSDOS 2.xx may have done - it uses a dynamically linked list which is expandable, and expands upon the current OS Pool. And According to A. Pratt, the NEW half-fixed Malloc will use this *much* more efficiently. The current ROMs can't change the size of the allocated part of the OS pool, or recombine it once returned.

Idea: Why not have the Malloc, or the low level OS Pool allocator detect that it has run out of handle space, then allocate a small part of the bottom of a free space (and perhaps return it if not the actual OS Pool). That way, if it failed, you would *really* be out of memory, but the OS Pool wouldn't be a restriction since it could then be extended as part of the normal Malloc process (I know it would take wierd code to do this, but it would fix both problems, since the current crop of Malloc violators don't break, they shouldn't invoke this function ever, and the new fixed applications would then work without worrying about handles).

> itself is probably using the new allocator.
> Howard Chu

I fail to see the problem -- I am almost always running with three malloc's
active at a time now, so four is not such an unreasonable leap of faith.

The obvious way is to have a Malloc_new that allocates two kinds of blocks:
real ones and Malloc_old blocks that are really double blocks (one that is
contiguous with the previous Malloc_old and the other that is used to keep
track of it). The only reason for two schemes is that the garbage collection
and overhead of the remote header may get expensive. Then if a program uses
the old Malloc function, his memory may get fragmented and he may have the
same old problems (but we want to be compatible, right (:^) ... and if the
program uses only the new functions memory does not fade away.

An alternative is to use Malloc_old as the master Malloc, and have some kind
of initialization call that would tell Malloc_new to grab all available memory
-- one big Malloc, so we can't return it in the wrong order (:^) -- and parcel
it out using a reasonable algorithm. This is in fact what my programs do now
-- I let MWC grab what it need to support the run time library, then I gram
all that is left (less several hundred bytes, just in case) and from then
on run my own memory allocator. Not a crash in a million mallocs!

So what am I missing? I admit there are probably problems with running
a shell that uses one Malloc underneath a shell using the other (spawning
subprocesses is a really nasty problem with this scheme, but it never
really worked before, so I see that as not much of a real problem), is
there another?

Enquiring minds want to know!

I was wondering, is the Atari decision not to fix malloc in the new ROM cast in stone? If they are reading the net and noting down votes for and against fixing , is there still time for it to be fixed before release?

My vote would be for fixing the bugs and releasing an 'Old malloc' program to keep the old sloppy programs happy (MALL100.PRG?). I was musing about the patch using the spare vectors, magic values etc to tell the OS at reset that malloc will be handled by such and such a routine. Maybe some folk would prefer TRAP interception?

Howard Chu and I have been running an archive of Atari ST
files for students and faculty of the University of Michigan. We
are now almost ready to go public and service the world.

We are an ideal site for an archive. We have unlimited
computing time and nearly unlimited disk storage on our mainframe.
We are accessable via Bitnet and will soon be accessable through
FTP. The host is at the hub of the new NSFnet, and our Internet
connectivity is unbeatable. We haven't found a good way for UUCP
sites to get at the archives yet, but that too will come soon.

At the moment, we are in the process of collecting more
software to put in the archives. Recently, a lot of people have
been posting news of new ports (gnuchess, gcc, moria, nethack,
etc.) We'd like to get a copy of all of those and all of the other
new ports for the archives. If you have software that you'd like
to post to our archive, then please mail it or ftp it to me.

If you want to submit a program by mail then send it to:
dyer@math.lsa.umich.edu

If you want to ftp to it to me then do this...
ftp 35.195.16.2
Name: FTP
Password: WHATEVER
Then send us whatever you got...
{grab some stuff for yourself while you're at it}

Remember, we have unlimited disk space so size is no object.
(ie, 1.5 megs of arced GCC sources are no problem) If you have any
questions about the technical aspects of our service, ask Howard.
(hyc@math.lsa.umich.edu). If you have questions about the files or
how/what to submit, ask me.

5148. OSS Pascal Linker Problems

Newsgroup: comp.sys.atari.st
Date: 1988-08-24 14:39:55 UTC
From: terrell@druhi.ATT.COM
Message-ID: <3428@druhi.ATT.COM>
Source record: 251051

About linker problems with O.S.S. Personal Pascal:

I get the "bssanf" error message when I forget to place the
{$M+} directive in the source text of a library.

I have version 2.??.

One bug that I've noticed: if you link with several libraries, when the
linker tries to link with the PASLIB library, it will give an error message
like "Cannot link PAS". When I shortened the names of my libraries, it
managed to link successfully. It looks like the names of all libraries
(user-defined, PASGEM, PASLIB) are stored in a short fixed-length
string. When the user specifies too many filenames, the list of filenames
is longer than the length of the string, and is effectively truncated...

I think that the most serious bugs with Personal Pascal involve the editor.
I almost never get through a long session without having the editor crash on me
at least once.

Except for the problems with the editor, I consider the Personal Pascal system
to be of very high quality.

Eric Terrell

>5 fixes on GemDos.

Yea.
Thats the point.

Today, I have two sets of ROMs (MEGA and pre-Mega) switchble and one
"patch" loaded to RAM (Turbodos; I like it.)

The RAM loaded patches can only be an intermediate fix for a ROM based
system. But isn't it a great way to release a fix for field-testing?

The best fix seems to be a new operating system, right?
Let's complain a little more about the heap of shit the st seems to be!
Maybe the next company dropping the st is Atari....

No. I'm doing serious work with my st.
I do dislike to loose some time writing my own little programs, because
the OS behaves a little "strange", but I (*I*) can live with it
(almost :-)

|by Steve Williams (edition by Sybex), page 357, Exception Processing
|(hope I'm not sued for copyrights, but then, this is for educational purposes
|only 8-):

[quotation deleted]...

|I should say this contradicts what Allan said. I'm not saying who's right
|or wrong, but I'm getting curious at the *REAL* facts.

Being curious and all, I checked things by writing a primitive
debugger; the *REAL* facts are that Allan was indeed right.
The book though seems misleading at this point, if not to say
incorrect:

o Since an exception clears the trace bit, an exception caused by
the instruction being traced causes the debugger to lose control,
unless the debugger receives control when exceptions occur.

The debugger can always *TAKE* control, just by setting the trace bit
after the exception occured. The above statement seems to imply that

exception happens --> debugger receives control
OR
--> debugger loses control

which simply isn't true. Just like Allan said, the debugger receives
control after the exception occured (the trace bit in the status word
on the stack being cleared by the exception). When the debugger resumes
the user program (by performing an RTE) it may be with or without this
trace bit set again. In the first case the exception handler will be
single-stepped, in the second case the debugger regains control when
the exception handler RTE's, because the status word with trace bit set
was pushed onto the supervisor stack when the exception occured.

Which makes me wonder why Allan used a break point to 'go at full speed'
through the exception handler; this neither seems necessary in this case,
seeing the above, nor wanted (you cannot 'break point' ROM code).

Leo.

5151. Re: Allan: is Fsfirst/Fsnext fixed in the NEW ROMS???

I forgot to mention: I reworked Fsfirst/Fsnext so they don't leave a
pointer to an OS data structure in your DTA. Therefore Fsfirst or
Fsnext in a folder does not make it active (except for the duration of
the OS call itself).

Sorry, Gert, but this is not the reason for the 40-folder bug. You give
the guy who wrote GEMDOS too much credit. He NEVER freed directory
descriptors back into the pool. He never even TRIED. There was no
provision for this AT ALL. He just ASSUMED that you wouldn't have
enough folders to fill up the OSPool. And don't get me started on the
interactions between Malloc and folders in the old GEMDOS...

> stepping the code within the trap handler); why this was just so isn't
> clear now.

First, your experience with sid.prg is misleading because sid, like my
debugger, treats the trap instruction specifically so you DO see
reasonable behavior.

Second, your quote starts with the correct sentence: when the trace bit
is set, a trace exception will occur immediately following the execution
of the target instruction. This is exactly what I said.

All the indented comments are in fact not correct. The first two have
the same wrong interpretation. When the T bit is set at the start of
the TRAP instruction, the exception will be taken at the end of the TRAP
instruction, when the PC is in the OS. The SR stacked by the trap

instruction will have the T bit set, but the SR stacked by the trace exception won't. The debugger DOES get control, but has to set the T bit explicitly if it wants to step through the trap handler. If it just RTEs from the trace exception, it will lose control (because, as I said, the SR from the trace exception has the T bit clear).

The third indented comment says that RTE causes the debugger to lose control. This is also untrue. The T bit in the SR at the START of the RTE instruction is the one which will cause the trace exception at the END of the RTE instruction, even if the T bit in the SR which the RTE got off the stack is clear.

The last one suffers from the same misconception all over again. In all four cases, the author misunderstands the effect of the T bit. He thinks that if the T bit is cleared during the execution of an instruction, you don't get the trace exception at the end of that instruction. This is just not true.

I quote: "If the T bit is asserted (on) at the beginning of the execution of and instruction, a trace exception will be generated after the execution of that instruction has completed." M68000 8-/16-/32-Bit Microprocessors Programmer's Reference Manual, Fifth Edition, by Motorola, copyrights 1979 through 1986, page 4-12.

OK, having Malloc fixed (though maybe not to everybody's liking) is better
than not having it fixed at all.

But Allan, could you please answer the questions in article
<528@nikhefh.hep.nl> regarding Fsfirst/Fsnext?? I fear that if those 21 bytes
that come first in the DTA buffer are not changed to incorporate some way to
have 'folder buffers' from GemDos point to the DTA buffer the 40 folder limit
may not be fixed. (I remember that Jos Vermaseren (t68@nikhefh.hep.nl) told
you about this problem a long time ago...)

I put the gcc executables in ssyx's anonymous ftp directory. I will split them up into mailable chunks soon, so the archive server can handle them. In the meantime, if you're on the internet, you can ftp to 128.114.133.1 and cd to pub/atari-misc. The sources and binaries archives are on the same machine; feel free to grab whatever you want. When I get the sources to gcc, I'll put them up as well.

These are my opinions, and in no way reflect those of UCSC, which are wrong.

One thing has got slightly lost in this discussion, that we are not talking about just fixing bugs in Malloc, but the whole function of the Malloc call would change. Until now Malloc has been useful (modulo the bugs) as a large scale allocator for a limited amount of blocks, changing Malloc to be a general purpose memory allocator, won't help anybody who actually has applications out there (or is writing a new one), because these programs will break on old versions of TOS. With other words, your application won't run on the computers of the largest part of your potential customers.

You can naturally get around this by distributing the new TOS on disk (perhaps together with your program?), but how many program run on a 520ST - 200kB ? Matter of fact you would be supprised how many programs don't run on a 1040ST - 200kB (I've been booting the Beta-TOS from disk for the last two months, since the EPROM's never made it here).

PS: anyway as Moshe Braner pointed out, Malloc is far too slow for anything serious.....

[The REORG / DL_II Dilemma]

What about the Norton's Speed-Disk algorithm ?
I've seen it on one of those with three big and blue letters on it :-) and it works VERY fine and SAFE. Nobody there, capable of managing this on the ST ?

(What about asking P.Norton to port all his utilities to the ST ? As the OS's are nearly the same, and I think the programs are not all written in 100% machine-code, it should be possible...)

BTW, what I DO need is a disk-editor (-doctor), which is capable of handling with read-errors and non-standard formatted disks (e.g. fat formats)
Any suggestions ?

To do the piggy back soldering you have to use 256K chips. Do to the fact that 1M chips are cheaper that 256K chips go with a board that takes the 1M.

[Note: I posted this (rather than mailed) as I wanted to draw this to more peoples attention.]

In article <4120005@wdl1.UUCP> dinolt@wdl1.UUCP (George W. Dinolt) writes:
[amongst other things]...
>In fact the MWC compiler has an lmalloc(lsize) which takes a long as an
>argument, so in that compiler at least, there is no need to use Malloc.

It depends on where this lmalloc does its allocation. In Lattice C
malloc also takes a long as argument (an int being 32 bits in
Lattice). Because the heap is lying between bss and stack the
available space for this malloc depends on what is allocated for the
program at startup time (by Mshrink); for instance a 'sh', a 'make', a
'find', a 'time' do have to leave room for other programs to exec in.
Then it can be profitable for a program to use both the system Malloc
and the C library's malloc.

I could however imagine a malloc that uses Malloc to reserve memory not
currently owned by the program... A clever one can even hide some of
the defiencies of the current Malloc (especially when it Malloc's in
big chunks so that it doesn't have to be clever too often, as
cleverness takes time 8-).

Leo.

> stopped compiling. The compiler gets to the last line of the file
> ("end."), and stops with the error
>
> Too many external references
>
The 1.xx versions allocated all external references (EXTERNAL procedures
at their first call, runtime routines and top level procedures when {$E+})
in an array having only 100 entries.

When you get this message at the very end of the program the runtime routine
'close' probably is the 101st entry...

This size in increased to 300 in the newer 2.xx versions. But since I didn't
receive royalties for 17 months there won't be a recent version
distributed in US.
The current German version (ST Pascal Plus) is 2.04.

> me a linking error, saying that the function "bssanf" is undeclared.
> My program doesn't use any function bssanf. :)

The symbol bssanf (bss-Anfang) is defined in the main module. This message
occurs if you link modules but no main program. All lowercase symbols
are internals. User declared symbols are always translated to uppercase.

5163. Midi ports

Newsgroup: comp.sys.atari.st
Date: 1988-08-25 14:16:42 UTC
From: cpc@HOLMES.LCS.MIT.EDU
Message-ID: <8808251416.AA06362@stark.LCS.MIT.EDU>
Source record: 251063

Hi,

About 2 years ago, I bought a 520 ST with a monochrome monitor and 2 single-density drives. As it turned out here in school, I am mainly using it as a terminal. (I use Uniterm.) However, I have a synth (a Kawai K1) and a MIDI sequencer (the cheaper of the 2 Dr.T's), and would like to use them together.

The problem:

When the ST receives a note (or, probably, anything) through MIDI IN, it pipes it through to MIDI OUT. My evidence is that when I hook both cables between the ST and the synth, the synth reports that it is *receiving* info whenever I play a noth on its keyboard. The sound is slightly different, and the number of voices is cut in half (because every note is being played twice. This has nothing to do with the Dr.T sequencer, because it happens when I just turn on the ST.

Some possible explainations:

o Perhaps this is the proper default state for the MIDI ports, and sequencers are expected to perform some kind of initialization to take them out of that state. In this case, it *would* be Dr.T's fault.

o Something with my synth. I don't understand the technical aspects of MIDI perfectly; however.... I had another synth (a Yamaha DX100), and whenever I ran Dr.T's with both cables hooked up to it, the synth reports a MIDI error and starts acting strangely. I can't remember ever trying it without running Dr.T's (like I tried with the Kawai).

Question:

Does anybody know why this is happening? Does anybody have any suggestions for a solution? Any help would be *greatly* appreciated. Thanx.

-chris colby

> PD MAC software on MAGIC format disks?

Current Notes magazine, which has some sort of affiliation with a bunch
of east-coast Atari user groups, has a library of about 50 Mac titles in
Magic format. Disk M2 has BinHex, FreeTerm, Stuffit, Packit, Kermit
and TermWorks. Disks are $4 each plus $1 for shipping up to 6 disks.
CN Library, 122 N. Johnson Rd., Sterling, VA 22170.

Their magazine is worth looking into. Incidentally, it's typeset entirely
on an Atari laser printer with Timeworks' publishing program.

The problem is probably in your MIDI _cables_.

Whenever the ST receives a note, it sends it out on the "Midi through"
port. "What MIDI through port?" you might ask. "I only see two MIDI ports;
out and in." That's where the problem lies--there are only two physical
ports--MIDI through is crammed into the MIDI out port.

The MIDI standard only uses three of the five pins available on the MIDI
port. One of these pins is ground, so someone at Atari realized that two
MIDI ports could be put on one physical connector. If you want to make
use of MIDI through, you can build a special "T" cable that splits the
non-standard ST MIDI out/through into two standard MIDI cables.

Why does this cause problems with some cables? Since the MIDI through pins
on a standard MIDI synth are unused, many "standard" MIDI cables short the
unassigned pins to their respective used pins. (I'll explain why and how
if anyone cares; suffice it to say that it's cheaper and easier.) On a
standard MIDI port, this doesn't cause any problems. On the ST's MIDI out
port, it can cause problems.

Such cables will also make MIDIMAZE non-functional. If you ever have MIDI
problems on an ST, the first thing you should check is the cables.

I'm looking for a decent command shell on the ST. I've found out
that there is a lot of crap out there. I have Gulam, and I'm not
happy with it because I don't want EMACs and I want to be able to
set the tab stops (why is this such a RARE feature in Atari ST
text editors?) I'm not saying the Gulam is crap--I know that if I fail
to mention that I have it, everyone will recommend it to me......

Can anyone tell me about the Micro C shell or the MT C shell?
Are they worth the money? Is there a decent version of Vi
for the ST?

> seeing the above, nor wanted (you cannot 'break point' ROM code).
>
> Leo.

Once again you are imposing what you think should happen on reality, and
it doesn't fit. Remember that the trace exception happens when the
trace bit was ON at the START of the instruction. But in the RTE from
the trap, the trace bit is getting set DURING the RTE instruction, so no
trace exception happens after the RTE instruction. The trace bit is now
set at the START of the instruction that the RTE returns to, so the
trace exception happens AFTER THAT INSTRUCTION. The result: you don't
see that instruction before it executes. But that's not what you expect
from a debugger (and not what you get from sid): you expect to see every
instruction before it executes. So you use a breakpoint to emulate the
behavior you expect. The breakpoint it set on the instruction after
the TRAP, so you see that instruction before it executes.

5169. Make from ST-Unix Toolkit

Newsgroup: comp.sys.atari.st
Date: 1988-08-25 21:07:22 UTC
From: ralph@lasso.UUCP
Message-ID: <8808252107.AA08310@inria.inria.fr>
Source record: 251069

A couple of months back the ST-Unix Toolkit was posted on the net. I enjoy it a lot, and have just recently tried to use its MAKE.PRG. If I type "make foo.prg" and the program is up to date, it says that the make is unnecessary, which is proper. If it is necessary to make the program, I get the message "Make: cannot find file or directory" or some such. I have tried from the gulam shell, from COMMAND.TOS, or putting the compiler on PATH, or defining make's CC and CC2 variables in a MAKEFILE. In the latter case, I don't get the message anymore, but I get 2 bombs (Bus Error).

Has anyone gotten this Make to work? Does anybody see what I'm doing wrong? Is there a more recent version of this Make? Any help would be appreciated. Since I don't get the USENET newsgroups, just the ARPA info-atari16 digest, please reply to me directly (or the digest) and of course I'll summarize if there's enough interest.

5171. Re: How to post umoria?

Newsgroup: comp.sys.atari.st
Date: 1988-08-25 21:43:47 UTC
From: saj@chinet.UUCP
Message-ID: <6380@chinet.UUCP>
Source record: 251071

I've started posting the ST version of umoria. It will be on the general order of 5 parts of text files and 10 parts of executable. It will absolutely not run with less than a meg of memory (sorry: even on the VAX it's a notorious hogxD). It's going to be a bit of a trick even to uudecode and unarc for those with only 1 floppy drive and 1 meg, so please be very cooperative with your neighbors once you have it running.
After seeing all the announcements of people's projects and how far along they are, I guess it's going to be an exciting couple months ahead.
And about that source: my sysadm said he wouldn't even have to deny me mail privileges if I posted it...his mail host would cut us all off. I'm offering to US mail it to any archive WHICH I CAN ACCESS DIRECTLY USING UNITERM, OR WHICH I CAN USE THROUGH chinet. That means not ftp-only,for the most part. But they should mail me (saj@chinet) and ask (and give me a US mail address, of course). I will try to post ordinary diffs against the distributed version to the sources group (unless that context diff program appears first).

5172. "new" file sys for ST

Newsgroup: comp.sys.atari.st
Date: 1988-08-25 22:47:26 UTC
From: rosenkra@Alliant.COM
Message-ID: <2311@alliant.Alliant.COM>
Source record: 251072

---
i've been thinking about this for a couple of hours now and thought i'd run it past you avid readers...

i am considering changing my hacked up {open,read,close,...}dir routines to make them faster. i currently use Fs{first,next} but these seem slow. another alternative is to read the FAT tables directly (crude but fast).

what i thought about was using a unix-like scheme to write a (hidden) file in each dir containing the dirent struct for each file. the files would be standalone and should not impact any other access scheme provided, of course, they have unique names. unix uses "." and ".." but this is out on the ST (perhaps "dot_____.___" and "dotdot__.___" ?). now it just becomes a task of creating a modified set of utilities (rm, cp, ls, mv, etc) or better yet lib functions (open/creat, fopen, rename, mkdir, etc) which update these hidden files. the dot file would be a multiple of 512 bytes in size, made larger/smaller as needed when entries were added/removed.

has anybody ever tried this or should i just wait for minix (a "real" ufs)?

-bill

5173. gcc source available for anonymous ftp

Newsgroup: comp.sys.atari.st
Date: 1988-08-25 22:48:37 UTC
From: koreth@ssyx.ucsc.edu
Message-ID: <4622@saturn.ucsc.edu>
Source record: 251073

Ssyx (128.114.133.1) now has the gcc source code available for anonymous ftp. I'm not sure whether I want to make it available on the archive server, too, as it is VERY large and would clog UUCP links for hours on end.

These are my opinions, and in no way reflect those of UCSC, which are wrong.

5174. lakesys.uucp and other sites with archives

Newsgroup: comp.sys.atari.st
Date: 1988-08-26 00:58:35 UTC
From: karl@es66.UUCP
Message-ID: <8808260058.AA00239@es66.escd.uucp>
Source record: 251074

Does anyone know a path to lakesys.uucp from one of the major Usenet hubs (like hplabs, ucbvax,
ames, etc.)? I would like to access the PD archives stored there, but I don't know how to get
there.

Also, are there any other sites that make archives available by mail (and not ftp) on Usenet
or Arpanet?

Please reply directly to me.

5175. NEC MultiSync II switchbox (color/mono)

Newsgroup: comp.sys.atari.st
Date: 1988-08-26 02:01:37 UTC
From: weaver@ldp.dec.com
Message-ID: <8808260201.AA27854@decwrl.dec.com>
Source record: 251075

```
NEC MultiSync II to Atari ST
--- --------- -- -- ----- --

Copyright (c) 1988 David S. Weaver
All rights reserved

This file may be copied freely only with the inclusion of the above
copyright notice for non-commercial use.

The NEC MultiSync II is an easy monitor to connect to your ST if
you want a monitor that can be used with systems other than just the
Atari ST. The following text describes how to build a switch box
to connect the MultiSync II to the ST to allow use of color or monochrome
with the flick of a switch.

Some specs for the MultiSync II and Atari:

NEC MultiSync II Atari
low medium high
------- ------- -------
Horizontal Frequency: 15.5kHz - 35kHz 15.8kHz 31.5kHz 35.7kHz
Vertical Frequency: 50Hz - 80Hz 60Hz 60Hz 71.2kHz
Horizontal Resolution: 800 dots 320 640 640
Vertical Resolution: 560 lines 200 200 400
Signal level: TTL pos --- --- ---
(analog) 0.7Vpp 75 ohm pos 1.0Vpp 75 ohm
Sync Signal level: TTL pos/neg TTL 3.3K neg
(analog) 0.3Vpp neg --- --- ---

As one can see from the chart, all the Atari specs fall with the NEC's
except for the 35.7kHz (instead of 35kHz) which doesn't seem to be a
problem. Also the video signals are a bit high (1.0Vpp rather than
0.7Vpp), but it seems to be working just fine without the addition of
any resisters. (If you want to add a resister, you would need 107-75
ohms or 32 ohms in series for the RGB signals, if I did my math correctly)

I initially had a problem with the NEC not syncing to high rez mode on
the ST after powering off the monitor and then powering it back on
again. The workaround was to either unplug the video cable, or reboot
the ST. I decided to add a switch to break the horizontal and
vertical sync lines. During the process, I switched the cables I was
using to feed the DB9 connector to some that were more flexible because I
had a problem with the signal lines breaking at the connector. I also
grounded the DB9 connector to the shield ground in the cable from the
Mega ST. As a result of this rework, I found I no longer needed the
extra switch to interrupt the sync signals.
```

The following pin assignments are what work when connecting an NEC MultiSync II to a Mega ST2 for color operation, they should work for any of the ST series:

MultiSync II Mega ST
(female DB-9) (male 13 pin DIN)

pin 1 red pin 7 red
pin 2 green pin 6 green
pin 3 blue pin 10 blue
pin 5 mode control or v sync pin 12 verticle sync
pin 4 h/v sync or h sync pin 2 composite sync
pin 6 red ground pin 13 ground
pin 7 green ground pin 13 ground
pin 8 blue ground pin 13 ground
pin 9 ground pin 13 ground

The Mega ST can also use this combination for sync:
pin 4 h/v sync or h sync pin 9 horizontal sync
pin 5 mode control or v sync * not connected

For monochrome to work, use the following connections instead of those listed for the same pins above:
pin 1 red pin 11 monochrome
pin 2 green pin 11 monochrome
pin 3 blue pin 11 monochrome

* Connect to pin 13 (ground) if you want to increase the vertical size on the screen. Not really needed as the front panel "v size" switch has enough control, and the image size is big enough with the "v size" switch in the dentented position.

In addition, you will want to provide a separate RCA jack to provide an audio out connection, given that the Multisync has no audio capabilities:

RCA jack ST connection
-------- -------------
audio pin 1 audio out
ground pin 13 ground

I ended up buying a "multisync" cable from Practical Solutions.

The Practical Solutions cable has the following color coding:

Pin Color Function
---- -------------- -----------------------
1 yellow coax audio out
2 black coax composite out (composite sync on Mega)
3 n/c
4 red monochome monitor (ground for monochrome)
5 n/c
6 green coax rgb - green

7 red coax rgb - red
8 blue coax shield +12V (may vary from ST to ST)
9 black horizontal sync
10 blue coax rgb-blue
11 white coax monochrome
12 white vertical sync

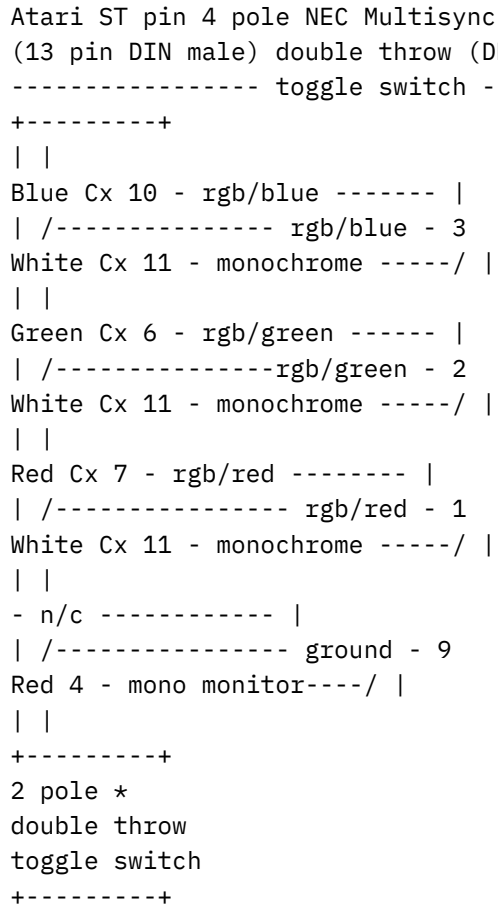
The following was verified with an ohm meter:

13 yellow coax shield ground
black coax shield ground
green coax shield ground
red coax shield ground
white coax shield ground

In addition the shield appeared to be grounded as well.

I cut about a 6" length of cable off the cable from Practical Solutions and used it to wire in a few switches to switch both the monochrome/color signals and the h/v/composite signals. This cable is much more flexible than the cable I tried using in my first attempt. By separating the individual shielded cables from the bulk wrap, you can get some very flexible/thin shielded coax.

The switch box ended up something like the following:



Atari ST pin 4 pole NEC Multisync-II pin
(13 pin DIN male) double throw (DB-9 female)
toggle switch
Blue Cx 10 - rgb/blue
rgb/blue - 3
White Cx 11 - monochrome
Green Cx 6 - rgb/green
rgb/green - 2
White Cx 11 - monochrome
Red Cx 7 - rgb/red
rgb/red - 1
White Cx 11 - monochrome
- n/c
ground - 9
Red 4 - mono monitor
2 pole *
double throw
toggle switch

```
| |
Black Cx 2 - comp sync ------ |
| /-------- comp/horiz sync - 4
Black 9 - horiz sync -----/ |
| |
| |
White Sh 13 - ground --------- |
| /--------- mode/vert sync - 5
White 12 - vert sync ------/ |
| |
+---------+
```

* This switch is purely optional, it allows use of both types of video sync, and will ground the mode pin to increase the vertical size when composite sync is switched in.

```
Red Sh 13 - ground ------------------------ red ground - 6
Green Sh 13 - ground ---------------------- green ground - 7
13 - ground ------------------------ blue ground - 8
13 - ground ---------------------------- ground - 9

Yellow C 1 - audio out --------------------- RCA signal line
Yellow S 13 - ground ----------------------- RCA ground line

shield ------------------------------------ shield
```

Note: Do NOT connect pin 8 (Blue coaxial shield) to any other pins/signals. This pin may have +12 volts on it. Make sure that you insulate the shield very well on this line so it won't make accidental contact with another signal.

When the cable is all built, use an ohm meter and make sure that you have no shorts. When you actually want to hook it up to test it, set the switches on the back of the MultiSync II to the following:

Switch State

manual switch on
mode switch gray (shouldn't matter, digital only)
color mode switch 64 (shouldn't matter, digital only)

Set the switches on the front to the following:

Switch State

v posi adjust after powering on
v size adjust after powering on
h posi adjust after powering on
h size on
text off (shouldn't matter, digital only)
text color white (shouldn't matter, digital only)

Now turn on power and you are on your way. Note that for all of the cabling of video signals, I used shielded cables (highly recommended) and soldered all the coax shields together and to the ground pins

(use a smaller braided cable to actually connect between the shields
and ground pins).

#	Part#	Description	Price:	Source:
1	76108	16-130 1 7/16"x4 13/32"x3 7/32" black box	8.99	A/E

1	273-1552	9-Volt Battery Eliminator	4.95	R/S
1	42-2444	6' Phono to Mini Phono Plug Cable	1.99	R/S

Total: $ 18.89

Grand Total: $ 77.50

P/S A/E R/S

Practical Solutions Active Electronics Radio Shack
1930 E. Grant Road 133 Flanders Road
Tuscon, Arizona, 85719 Westborough, MA 01581
(602)884-9612 1-800-343-0874
(617) 366-8899

You will also need various drill bits, solder, and some tool to cut a
hole for the DB9 connector into the plastic end of the aluminum/plastic
box. The grommet is to protect the ST monitor cable entering the box.

Disclaimers:

- This hookup worked for my Mega ST, I make no gaurantees it will work correctly on your ST, it has also been tested on a 1040 ST using the h & v sync and seemed to work just fine.
- I have no connection with NEC, Practical Solutions, Active Electronics or Radio Shack.

5176. Re: Questions about ST Video Ram

Newsgroup: comp.sys.atari.st
Date: 1988-08-26 02:51:50 UTC
From: jpdres13@usl-pc.usl.edu
Message-ID: <12@usl-pc.usl.edu>
Source record: 251076

In article <535@skywest.UUCP> brenes@skywest.UUCP (Erasmo Brenes) writes:
>... If the Shifter expects the video ram to start at 32K boundaries,
>then how do I get MWC, or any C program to allocate a 32Kb buffer starting in
>a 32Kb boundary in an efficient manner? An initial thought was to use Malloc()
>to allocate 64Kb and then only use the 32Kb which start in a 32Kb boundary,
>but this method is too wasteful. There's got to be a better way, isn't there?

Here is how I find a 256 byte boundary to put in a screen.

```
char *blk; /* Pointer to the start of */
/* malloc'ed block. */
char *work_scr; /* New screen desired. */
char *desktop_scr; /* Old screen pointer. */

desktop_scr = (char *)Physbase(); /* Save old screen pointer.*/

/* Find a screen pointer */
/* On a 256 byte boundary. */
work_scr=(char *)( (long)(blk=malloc(32768L)) & 0xffffff00 )+0x0100;

Setscreen(work_scr,work_scr,-1); /* Flip in work screen. */
```

The "blk" pointer will give you a pointer to the beginning of the actual
block of mem that was malloc'ed, use this at the end of the program to
"free" up the memory.

The "work_scr" gives you the pointer to the new screen that you want to fill
with data.

The "desktop_scr" gives you the pointer to your old desktop. If you want a
graceful exit back to the desktop at the end of your program, make sure
to make this the current screen with the Setscreen() command right before
you exit.

The next line of code is not mine, I got it here off the net a while
back. I don't know who wrote it in it's original state, but it works fine.
It will place your pointer on a 256 byte boundary in your malloc'ed block.
I have not really taken the time to see how exactly it works, I just know that
it does. I was going to write my own ... when the very same day I saw this
thing. I plugged it in and it worked! Not one to re-invent the wheel,
I hardly ever glanced at it again, all that I ever did to it was add in the
"blk=" assignment.

The last line of code of course, sets the screen to the new work area.

Hope this helps,

Ten to twelve minutes to lay out a single page? Using what?
I can't believe anything is that slow, on any machine! If
something takes a minute a page, I get mighty upset; I expect
most things to run at at least four pages a minute. A simple
eighty page report would take thirteen *hours* to print at
10 minutes a page! What gives?

From: leo@philmds.UUCP
Message-ID: <623@philmds.UUCP>
Source record: 251079

```
In article <566@laura.UUCP> klute@trillian.UUCP (Rainer Klute) writes:
|Hello ST-hackers,
|
|does anyone know about a 'legal' way to do something like this:
|
|
|Routine_A: Routine_B:
|========== ==========
|Fsfirst (...); .
|Fsnext (); .
| . Fsfirst (...);
| . Fsnext ();
|Call_Routine_B (); .
| . .
| . return;
|Fsnext ();

Use Fsetdta(dtabuf); just before each invocation of either Fsfirst() or
Fsnext(); GEMDOS uses the first 21 bytes of the DTA-buffer to keep
track. There is little overhead in the use of this GEMDOS call, since
it merely sets a pointer to 'dtabuf' in the basepage (you could even do
it yourself 8-). Of course Routine_A and Routine_B should each use
their own 'dtabuf'. Note that this 44-byte buffer must be
word-aligned.
I thought that the default DTA-buffer (i.e. if your program does not
set it) is at basepage + 0x80 (yes, writing over your argument string 8-).

Leo.

From: dsmall@well.UUCP
Message-ID: <6926@well.UUCP>
Source record: 251080
Body handling: HTML body converted to readable text

Stuffit has run fine on the Magic Sac for some time. We discovered
that you need Finder 5.3/5.4 and System 3.2, as well as >256K RAM
space (e.g., 512K or 832K Magic Sac option) to make it work, which rules
it out for 512K machine owners (520 ST). Packit has none of these limits,
so it's more compatible with more Magic Sacs.
I've heard several rumours that the Aladdin is now shareware, the authors
have moved on, etc. I'd appreciate it if you could fill me in on the details,
since this is the only service I subscribe to that jumps the "lake" with
such frequency.
Thus, in summary, you don't need to do resource moves to make Stuffit run
under Magic Sac; just use the proper System and Finder. (By the way, if
you have a version of Magic Sac that's < 5.91, it may have a problem running
those Systems and Finders -- best upgrade).

5181. Re: To fix or not to fix.

Newsgroup: comp.sys.atari.st
Date: 1988-08-26 07:48:27 UTC
From: KEITH@SYSD.SALFORD.AC.UK
Message-ID: <KW.D6XG.260888@SALF.D>
Source record: 251081

Atari already went down this route once, when the XLs were introduced they weren't 100% compatible with the older machines but they did have RAM located "underneath" the OS ROMS. Various translator disks were produced that turned off the OS in ROM and loaded the older OS into RAM.

When the ST was introduced the OS was on disk but was moved to ROM to save memory in the limited 512K available. With larger memories perhaps its time for a move back to this system at least for intermediate fixes/upgrades and to enable users to load older ill-behaved software.

I, owning a MEGA ST2 with blitter, could use a disk based, pre-blitter OS that would turn off the blitter and give the option of booting other software before attempting to initialise the desktop.

Would the original OS do this ? If so how can I get hold of a copy ? (I haven't seen it in any PD lists). Maybe only a small patch would be needed ?

Releasing new upgrades/fixes this way would have benefits for Atari too. They would have the best chance to sort out any bugs before taking the expensive step of commiting yet another buggy OS to silicon !!

5182. New Data Pacific Newsletter

Newsgroup: comp.sys.atari.st
Date: 1988-08-26 08:04:18 UTC
From: dsmall@well.UUCP
Message-ID: <6929@well.UUCP>
Source record: 251082

Data Pacific has released a new newsletter in the last few days that deserves a warning. It's full of distortions, half-truths, is misleading, and contains some flat false information. It's going to confuse a lot of people, so I'm trying to spread the word.

For instance, the newsletter contains columns from people who no longer work at dP (most of dP's staff quit in March-April, including me). It talks of a new tech person, "Mike", who does not exist and who always has been a pseduonym for Joel when taking tech calls.

More subtly, the newsletter implies that dP is having me look into a 128K ROM version of the Magic Sac. This is false; I have nothing to do with Data Pacific (except for one contract job -- version 6.1 of Magic Sac, in exchange for a LaserWriter). dP (Joel) agreed long ago to stop using my name to try to sell their products; they've broken their promise.

The newsletter says Dan Moore (dlm@druhi here) "worked overtime" to produce Mover 1.7. The truth is, Dan did Mover 1.7 for a flat $150 fee in July. He was paid by check after dropping off the disk; his bank later told him that Joel *had stopped the check*. In short, dP is selling a version of Mover 1.7 that they flat stole from Dan.

If you appreciate any of the contributions Dan has made to the ST world, such as the Twister disk format, Meg-a-minute backup, Protect desk accessory, and others, you could return him the favor by refusing to buy dP's disk until they remove Mover 1.7 from it, and letting them know why. Dan's had a rough month; he broke his hand recently, and is in a cast to his elbow (any get well cards sent via email would be greatly appreciated), by the way.

In my opinion, Data Pacific is attempting to present an image that things are as they were during the good days, while selling off as much stock as possible, with this newsletter -- then they're getting out. How else to explain them putting Apple's own Switcher and FONT/DA Mover on their "public domain" disk -- other than dP isn't planning on being around long enough for Apple to catch them (and rightfully so; Hertzfeld worked hard on Switcher).

I'd like it made clear I have nothing to do with Data Pacific anymore; I answer dP related questions out of courtesy to my old customers, and nothing more. The same is true for Dan Moore. The tactics Data Pacific is stooping to, in my opinion, to milk a little more money from the Magic Sac before folding up are shoddy in the extreme, and I think it's a shame my name is still associated with this company. Hence, this note.

As for me, I have a new company, Gadgets By Small, Inc, and we're planning on releasing our first product (the Spectre 128) on Sept. 16, at the Atari Glendale Atarifest show. Since dP has broken it's word (again) to give me

access to their customer mailing list, which I built, I can't put out the word about the Spectre 128 upgrade to the Magic Sac except by the networks.

For the record, and to answer a previous questions, I left Data Pacific in March of this year, when it became clear that (a) Joel was not going to honor our agreements, and (b) when I found out the FCC number being put on the Translator units had been forged, and Joel had no plans to ever FCC certify the unit. Believe me, I want no part of trying to slip one past the FCC. (Every Translator unit shipped bears this same false number.) I wouldn't be party to this; neither would Dan, when he heard. (Thanks to our friends from Supra for checking the number at the FCC BBS and telling us what had happened!)

I plan to carry on support of dP buyers with my new company, here and on other networks, as a courtesy to the people who shelled out money for the Magic Sac, but via a new company (Gadgets), as well as "push the envelope" further on Mac emulation with the Spectre 128 product. I don't want to advertise here on the net publicly; please drop me email privately if you're interested (hplabs!well!dsmall or dsmall@well); I don't think the local community would appreciate a few hundred "Yes, please send me info" notes here in comp.sys.atari.st.

Thanks for reading a rather long note; I plead that I'm used to getting paid by wordcount <grin>.

>see, someone could easily write all over the links, then all hell breaks
>loose especially in a system with no protection. Why not keep the block
>parameters in tables somewhere else? Maybe even The Kernel could keep them
>in Protected Memory and thus have global memory allocation (and fragmentation).
>I digress...

I *LIKE* the Unix malloc(); it is a flexible and portable memory allocator, and if you're not stuck with a too bad implementation it can be pretty fast too (in my shell I use a malloc that resembles the BSD malloc, it is much faster than the one that comes with my - Lattice C - compiler, and it does not fragment memory too badly). Having links in protected memory implies you have to use system calls (which generally does not speed things up).

The chances of writing over a link in the heap are certainly not greater than writing over a char array on the stack, which is probably more dangerous (destroying return addresses & link pointers).

The incorrectness of a destroyed link in malloc *CAN* be checked by the way; not 100% foolproof but much easier than checking a destroyed stack.

If you have chosen for a system without protection you should not complain about some part being insecure while leaving the rest alone. I'd rather have the FAT's and stuff in protected memory; if they get messed up you really are in trouble (disks unreadable at least).

Leo.

5184. ATARI Maintenance needed

Newsgroup: comp.sys.atari.st
Date: 1988-08-26 13:51:12 UTC
From: john@oravax.UUCP
Message-ID: <456@oravax.UUCP>
Source record: 251084

Can anyone provide the name/tel/address of an ATARI repair center somewhere close to the Central NY area. The local Ithaca dealer/repair center went bust and there doesn't seem to be such an outlet very close; we've searched Rochester to Syracuse.
We made a corporate decision several years back to go with these as our basic office machine for both off-line and mainframe access devices. We now find ourselves with lots of down parts from monitors to diskdrive to keyboards. Either we come up with a reasonable repair solution or we make a new and better decision and offer all this junk "for parts."

Thanks in advance

oravax!john@cu-arpa.cs.cornell.edu

5185. A request for Atari ST X Window server info

Newsgroup: comp.sys.atari.st

I read an article by Ray Anderson (.EXE Magazine, March 1988) a while back
that made reference to a 'server' for the X Window system on the Atari ST.
Does anyone have any further information on this implementation for the
Atari ? Either a posting or direct e-mail to me would be greatly appreciated.

Date: 26 August 1988 12:31:54 CDT
From: U46050 at UICVM (JOHN ZAFIRIS)
To: Info-Atari16@SCORE.STANFORD.EDU
Subject: CAP

Some time ago a program called CAP (Circuit Analysis Program) was posted to a server and there was some talk about it which peeked my interest. I downloaded the CAP files from (I think it was) Canada but what was there was incomplete: all support files and help files but no program file. It is kinda' like getting all the options but no car. If anybody out there has a copy of the whole CAP package please either send me a copy or post it to a server so we can all get our grubby little hands on it. Thanks... ...John

5187. Re: ibm pc diskettes (LOTS OF DETAIL)

The ST already uses IBM PC compatible disks. The one restriction is
that the disks must be formatted on a PC, not on an ST. That
restriction is lifted for the new ROMs coming soon to an ST near you
(officially called TOS 1.4).

Be careful when using PC disks, though: if you use one PC-formatted disk
on an ST, then pop it out and insert another one, the ST will NOT
recognize the fact that a new disk is in the drive. The way to be sure
that the ST figures this out is to put an ST-formatted disk in the drive
and access it (get a directory or something) between the two
PC-formatted disks.

If you want to know why this is, read on:

GEMDOS, like all good operating systems, keeps information about a disk
in its private memory. This information includes things like the sizes
of the various parts of the disk, and some of the most-recently used
information. When you change from one disk to another, the OS has to
realize that its memory is out of date -- this is called "media change."

The OS detects that the media MIGHT HAVE changed when you pop the disk
out. If you put the same disk back in, the OS will realize that and
it won't invalidate its memory about that disk.

The trick used is to check the SERIAL NUMBER of the disk. The serial
number is a random 3-byte number written to the disk when it was
formatted. The assumption is that it is highly unlikely that two disks
will have the same serial number, or if they do they will not be used
one after the other.

Unfortunately, the IBM PC doesn't use this same system. Disks formatted
on a PC all seem to have the same serial number, so the OS can't tell
them apart. When you switch from one to another, the OS will merrily
decide that the same disk is in the drive after all.

This business about serial numbers has NOT changed in the new TOS.
However, the desktop has been changed: it has always been true that a
window is open on a drive, you can hit ESCAPE to redisplay the
directory. Now, however, when you hit ESCAPE the Desktop *forces*
the OS to forget what it knew about the disk in the drive and
re-read everything. It *forces* a media change.

As I said before, disks formatted with TOS 1.4 are totally IBM compatible,
and have the added feature of random serial numbers, so these problems
should become more rare.

5188. IBM?DISK?

Newsgroup: comp.sys.atari.st
Date: 1988-08-26 18:30:54 UTC
From: U46050@UICVM.BITNET
Message-ID: <8808261941.AA17519@ucbvax.Berkeley.EDU>
Source record: 251088

A friend recently had the following problem with his disk drive: it would not read semi-standard (10 sector twisted by DCformat) atari disks and would produce a bunch of heiroglyphics for file names etc. When standard IBM disks are used, they work fine. This problem had not cropped up before and is not associated with head allignment (which causes a similar problem on some drives). The drive seems to differenciate between Atari and IBM disks. Is his machine slowly turning into an IBM (dread!) clone? Can this horrible fate be altered or will he start to get INTERNAL STACK FAILURE notices and 64K boundary problems? Any explanation no matter how fanciful is welcome. ...John

5189. NEW NEWSGROUP PROPOSED: rec.games.pc

Newsgroup: comp.sys.atari.st
Date: 1988-08-26 18:33:52 UTC
From: jennifer@jato.Jpl.Nasa.Gov
Message-ID: <87@jato.Jpl.Nasa.Gov>
Source record: 251089
Cross-posted to: comp.sys.amiga,comp.sys.atari.8bit,comp.sys.atari.st

I am proposing a new news group, rec.games.pc for the discussion and exchange of personal computer (not video/cartridge or games available on UNIX/VMS systems) game clues and help. This would include Infocom games, Computer Roleplaying games, graphic adventure games, and any other games available solely for the personal computers. I would also post PC game vendor support messages when I had information pertaining to that. Currently, this discussion goes on in rec.games.misc and various other system based groups. Most games for the personal computers are now ported to most systems, and having a central newsgroup in order to support these games makes sense. This would also allow rec.games.misc to be what it says; namely a group to discuss games that are not covered by other groups, instead of the default repository for PC based games.

This would be an unmoderated group. I would request that when messages contain spoilers, that the word "spoiler" be contained in the subject. When the message contains spoilers that could be based on the actual version of the game, that the version (IBM, Apple, etc) be put in the message.

Please vote by E-mail to the addresses listed in the signature file below. DO NOT POST YOUR VOTES! In order to succeed, there needs to be 100 more yes votes than no votes. The voting can begin today, and end on 9/24/88. I'm directing follow up discussion to rec.games.misc and news.groups.

5190. The BREAK program in comp.sources.atari.st

Newsgroup: comp.sys.atari.st
Date: 1988-08-26 18:43:07 UTC
From: apratt@atari.UUCP
Message-ID: <1134@atari.UUCP>
Source record: 251090

The author of "break" (L.J.M. de Wit) has committed one of the cardinal sins of TOS programming: he has used the location of an OS private variable in his utility code. He uses the address of GEMDOS's current-process variable. He uses this to follow the parent's-basepage list up, to see if he is about to terminate the Desktop.

Moreover, he doesn't check to see whether he is a second-level interrupt. If the IKBD interrupted some other interrupt (possible but unlikely), this program will crash hard.

Something that fixes both of these problems is to check the stacked SR from the interrupt. If the processor was in User mode, you know (A) it isn't the desktop, and (B) you aren't a second-level interrupt, therefore (C) it's safe to call Pterm when you return.

If it's NOT safe, the ctl-delete should be removed from the queue. That way, it's like it never happened. This means it might take several Ctl-Deletes to stop a process, but the ones that don't stop it also won't do any harm.

I suggest the author take his code apart and look into these changes.. The worst part is the absolute-variable-location problem -- this makes his code ROM-version dependent, and he doesn't even bother to check the version number!

5191. Bugs in new BETA ROMS?

Newsgroup: comp.sys.atari.st
Date: 1988-08-26 18:59:16 UTC
From: med@druhi.ATT.COM
Message-ID: <3446@druhi.ATT.COM>
Source record: 251091

I hear through the grapevine that there is what I would
consider a very serious bug in the new BETA ROMS. I can't verify
this myself, but the problem affects the way I use the ST enough
to ask and see if this is really a bug.

I tend to create a number of windows in my desktop.inf
file in which I change the pattern (via an editor) from the standard
. pattern to a known pattern (i.e. for Micro C shell - gemcsh.prg).
This then brings up a window at boot time that has only this entry in
it, so I can quickly start Micro C shell, or Magic Sac, or...

Well, on the new BETA ROMS, the window comes up at usual, but
you *cannot open* the ICON (e.g. it won't execute)! You can select it
(in fact, many times), but it will not execute. In fact, after some
number of clicks, you get 2 bombs and the system reboots.

This is all hearsay, as I couldn't possibly have my own
copy of these ROMs (;-)... But I do feel that this is another case of
fix a few, and create some new - bugs, that is....

Myron Drapal
AT&T Denver
att!druhi!med

P.S. Has anyone else heard of any new bugs introduced in the BETA ROMS?
Are there any (real) BETA testers out there who would like to comment?
Any news from the *official* Atari mouthpieces? Inquiring minds
want/need to know...

I think you are talking about text dumps to the printer. These it does quite
quickly. This discussion is about graphics.

Ever used a Macintosh laser printer, I got very used to 45-50 minutes
for a moderately simple graphic.

>sheet through again, and again, and again.

The DeskJet certainly can do a full page of graphics. The fact that DeskJet does not store a page of graphics (requiring 1 Meg of RAM) yet can still do a full page of 300DPI graphics is one reason the DeskJet is cheaper than a LaserJet. It is also the fundamental reason a DeskJet is not 100% LaserJet compatable. LaserJet drivers that send out graphics in a serial fashion going down the page work fine with the DeskJet. Other LaserJet drivers (esp. desktop publishing) which randomly sends graphics out on the page will not work. One common LaserJet "graphics compaction" trick involves continuously twiddling the graphics margins. This trick generally degrades DeskJet performance since whenever graphics margins change the previous graphics must be printed. This can result in printing only a couple of nozzles per pass. The DeskJet supports 2 different data compaction modes that the LaserJet does not support so please, DeskJet users, encourage software vendors to write DeskJet drivers.

I wrote the DeskJet Epson emulation cartridge and landscape cartridge (I had help) firmware and am working on future inkjet technology printers. I just started reading this newsgroup so I have not participated in previous conversations about the DeskJet. If people have any questions about the DeskJet drop me a line, I know the printer inside and out. You will probably hear more from me in other discussions about the DeskJet.

One other factor about the DeskJet. It was designed to be primarily a text oriented device since that is what most people use their printers for. Hence certain tradeoffs were made to improve text performance at the expense of graphics. A page of 300DPI graphics typically takes about 5 minutes. Although this is slower than I would like, I have found many applications take this long to generate a page of 300DPI graphics anyway. I must confess ignorance, however, as to the performance of the atari ST applications and driver.

As a previous poster mentioned, the DeskJet ink is smears badly if you get the print wet. This is in my optinion, the most negative feature of the DeskJet. Despite this, I still use DeskJets at work and home

and find this to not be a real big problem. Fortunately, waterfast ink is the #1 priority of our division that makes the ink cartriges. Much better ink should be available "soon", but I can't give dates or make promises.

From: neff@hpvcla.HP.COM
Message-ID: <4730024@hpvcla.HP.COM>
Source record: 251094

I have already responded to Tom personally, but I would like to clarify
a few points.

The DeskJet was designed to be a high quality high speed TEXT printer
with high quality graphics capability for occasional graphics needs.
Certain design tradeoffs were made which intentionally optimized for
text applications over graphics applications -- most significantly
the 16K input buffer. If I could replace the 16K input buffer with
a 4K buffer and user the 12K for graphics I could double the graphics
performance. But I can't ...

Atari users tend to be graphics oriented. If the DeskJet meets
your needs, despite its slow graphics performance, great. If
we added a page of RAM, our cost advantage over laser printers would
go down the tubes, and who would buy a DeskJet?

As for font/download incompatabilies between the LaserJet Plus/II
and DeskJet, the DeskJet uses a 600DPI horizontal resolution with
no consecutive dots being fired in order to get optimal text quality.
LaserJet fonts (in a DeskJet) just do not look as good as the tweeked DeskJet
fonts. Moreover, DeskJet fonts use data compaction to put more fonts in less
ROM, the LaserJet does not. This results in font cartridges for
DeskJet that cost about 1/3 as those of the LaserJet and gives
beter print quality than the LaserJet fonts would.

Midi in should definately *not* be automatically routed to midi out. Since the atari is not equipped with a midi thru port, most sequencers for the machine allow you to echo midi in to midi out. But, only if you explicitly tell the software to do so.

I think you may be experiencing a problem with your midi cables. I was told when I bought my synth that there was something a bit off with the ports on the atari (I can't remember exactly what it was now) and that the higher quality midi cables were needed. The cheaper cables have a pin or two fused together (or something like that) and won't work correctly with the atari.

Again, using what? 45 minutes a page? That is simply unusable.
Even full-page 300 dpi graphics shouldn't take more than a couple
of minutes a page, absolute maximum. I repeat, *what* *software*
gives you such poor performance?

The XL operating systems WERE 100% (or nearly so) compatable with the old OS in the Atari 800/400's. It was the illegal system calls written in by the "Software Engineers" at various
companies that caused all the grief. And what about those cases where you absolutely had to make an illegal system call? There is a quasi-legal way to do it. Check the sources for the XEP-80. If you need more info I can state case after case where the authors of some well known pieces of software have made illegal calls to the OS.

Subject: low cost HARDDISK interface

In his article (9 Aug 88 15:07:47 GMT) icc!jlong@blackbird.afit.af.mil
(Jeffrey K. Long) asked:
>Could someone please post more info on the article in the German magazine that
>told how to hook up a standard XT drive and controller to the ST! Several
>people in my user's group are very interested in this prospect. I understand
> that a circuit board and some driver software are all that is needed. I also

>catch other than the fact that you don't have access to your DMA port?
>Is this thing slower than using a Berkley board and Adaptec controller?
>What magazine did it appear in (Name and Issue) and would anyone who reads
>German be willing to translate the article to English? Help!!!!!

The low cost solution mentioned was published in the German magazine "c't"
(Verlag Heinz Heise GmbH & CoKG, D-3000 Hannover, W-Germany)
issue 2/88 p126ff . It uses an OMTI 55xx controller and a small interface
build up of 5 `standard' 74xx ICs. This solution occupies the whole DMA port -
so you have no further access to the DMA port. In issue 5/88 p122ff a ROM
patch was published which allows an autoboot.

Based on the idea of using an OMTI controller I developed another small
interface (9 `standard' 74xx ICs) which does not block the DMA port but
provides drivers for all important DMA port signals. It uses also the OMTI
controller 55xx and I have tested it with two controllers each supporting an
OMTI 5527a with 2 ST277R drives (240 MB in total !). But I haven't tested
the controller with Atari or foreign DMA port devices - in fact I don't
believe that it will work with the Atari laser printer (I have heard that
many other DMA port devices have difficulties with this printer or the
software). But I wanted to keep the port clean for further self build
hardware extentions and not for obscure foreign products.
The controller works with no problems since April 88 - the software (not
identical to that published in c't) consists of a GEMDOS driver,formatter &
utilities, an OS9 driver (real multitasking) & software to access GEMDOS
partitions from OS9 and vice versa. 8 partitions per Harddisk, 2 drives per
controller (up to 8 controllers,...) are supported. The speed is primarily
limited by the operating system (even with Fatspeed) - data transfer rate
with an OMTI 5527a : Interleave 1, 512 Bytes/sector, 26 sectors/track,
60 rpm = 800 kByte/s (There is no hardware to slow down the data transfer
rate !). My favorite solution consits of an OMTI 5527a and 1 or 2 ST277R
(each 65 MB), but I have also used an ST238R (32MB) and an ST251 (40 MB)
with an OMTI 5520a.
So the costs for a 60 MB harddisk are:
selfbuild controller + cabels c 50 DM
OMTI 5527a c 170 DM

Seagate ST277R c 850 DM
---
c 1070 DM c $580
+ Power supply

If there exits an real interest (several requests) I would try to explain my own solution in detail and to post the sources (c200 k), but I won't translate the c't solution (I don't know whether they would agree,...)

In a limited amount I would also be able to produce and send boards for about 20 DM + postage. If there is a real great request I will perhaps snake mail a copy of the layout (2 sided) to a few persons who oblige to distribute this copy to all persons interested in it in their region.

> [...] I want to be able to
> set the tab stops (why is this such a RARE feature in Atari ST
> text editors?)

To set tabs in Gulam, use ^U (universal argument) and enter
the number of columns you want per tab, then hit the [Tab] key.

David Parsons has written a very nice, (and very small!) shell
for the ST called TSH (teeny-shell). If you can find that around
anywhere, check it out. He has also written a shareware VI clone
called LEVEE. I'm not a big VI fan myself, but I've heard good things about
LEVEE. I have used the teeny-shell as well, and it is very nice.
However, I've become hooked on gulam because it suits my environment
perfectly (the built-in terminal emulator and file transfer commands are
ideal for the kind of work I do here). And I like Emacs-style editors ;-).

Dave,

The package you are looking for is called CRAFT. CRAFT contains a very good shell (called "GPshell") and editor (called "STedi"), the last one completely written in assembler (FAST!).

The "GPshell" is almost 100% csh compatible. It is even possible to use a slash as the default path separator! History, commandline editing with cursor keys, I/O redirection, pipes, aliases, REAL pattern matching, filename completion, if-then-else, foreach, switch: GPshell has it all. Plus a lot of utilities: an integrated make, format, time, built-in ramdisk & disk cache, fgrep, etc etc.

One of the (many) excellent features of "STedi" is a very powerful and flexible tab handler. You can set tabs anywhere you want (for example tab stops at position 4, 6, 9, 15, 30 & 40). There is also a command to replace spaces by tabs or vice-versa. Using a special FORTRAN wrap-line mode, it is even possible to let STedi automatically insert the continuation character this language needs.

CRAFT comes with an extensive manual (in english, over 600 pages) and costs Fl 395,- (about $200). The manufacturer is:

Perhaps the most confusing point about your posting is calling a LINE A *exception* a *TRAP* call. All 680x0 boxes have *TRAP* vectors staring at HEX $50. The ST actually uses LINE F for GEM calls, and LINE A for low level screen BLT routines.

Of course, Motorola specificaaly reserved LINE F for math calls in the 68881 I believe.

But teh original intent of your message, in other words, document location and a method for returning and changing these locations, would be a nice touch. I believe tho, if you pass an illegal function number to one of the trap handlers (1, 13, 14) you get a pointer to the function table in A0. This is not documented that I know of, and is more or less a side-effect of passing an illegal function number. Of course, it is trivial at this point to get a pointer to the desired routine, but nothing is standardized then.

This whole conversation reflects the basic public misunderstanding of laser printers. They are not fast; they just sound that way.

It's not the software. It's the combination of the interpreted page description language, hardware bottlenecks, and the way complex graphics are drawn, redrawn and redrawn again as the image is built in the laser printer.

If you pick up your daily newspaper, you probably will find an informational graphic produced on a Macintosh with a LaserWriter, Varityper VT600 or Linotype laser typesetter.

A weather map, for example, may contain HUNDREDS of graphic objects, many hidden under subsequent layers as the map is modified. Even though these layers are not shown, they still exist, and they still are converted into a page-description language, transmitted to the lasersetter over a maddeningly slow serial connection, and reconstructed in a new bitmap by the CPU in the laser device.

If the image requires a type font that is not resident in the laser device, the entire font description -- encoded in the page-description language -- has to be downloaded from the computer or file server. (The VT600 has its own hard drive, which speeds things up somewhat.)

Obviously, all these conversions and reconstructions are going to take more time than simply dumping a 300dpi bitmap directly to the laser controller.

That's why the Atari laser printer (this is the Atari conference, isn't it?) is so much faster. The GDOS printer driver creates the new image directly in the Mega's RAM from the GEM internal description, and the image is stuffed out the DMA port and into the laser printer.

OK, so why isn't the world beating down Atari's door?

* "Everybody knows" Atari only makes toy computers.

* The typefaces currently available for the ST/Mega range from poor to horrible. They are simply not up to publication standards.

* The software available for the Atari is only beginning to move into the "marginally acceptable" range. Consider: Timeworks Publisher vs. Quark X-Press; Migraph vs. Adobe Illustrator; ??? vs. Cricket Graph.

* The Atari cannot import standard clip art graphics (available on CD-ROM from several services), which are intended for Macintosh and/or PostScript-based programs. I work in the newspaper industry, which has settled on the Mac standard. Graphics from the AP, Knight-Ridder, Newhouse, etc., can not be "massaged" on the Atari.

* The Atari laser printer works on one machine. Any shop big enough to have a laser in the first place is likely to have three or four computers. Where is Atari's answer to Appletalk? Ethernet? Tops/NFS? Atari only has "sneakernet" and modems.

* You have to hire a native guide to find an Atari dealer.

10-12 minutes is perfectly reasonable for, say, a 512 by 512 greyscale
image being sent to a LaserWriter via PostScript. The dithering, etc.
just takes a while.

I have waited close to an hour for a page of CricketDraw graphics with lots of neat Postscript effects on them. It wasn't pleasant waiting (I was under a deadline) but it did look quite nice when it finally came out. Definately not a speed demon, Postscript. I think some company makes some sort of speedup program that is quite a lot faster than Postscript. But I'm talking about page description languages, not the speed of the laser printer. I think the LaserWriter is rated at 6 pages/minute. What is the DeskJet rated at (whatever the comparison factor might be)? Also, does anyone know if a DeskJet can be easily connected to a Mac with good drivers to take advantage of its capabilities (I don't really want to emulate an Epson FX-80 too often any more)?

I have heard several reports that there are discussions on US networks along the line of Lisowski's remarks. Well, They told me that they wouldn't charge me until they shipped the product, but they billed me in June for a "Sneak preview" that I don't want that was shipped in August. I am only interested in working versions. The literature enclosed with the shipment did NOT say that "it would not work", although it acknowledged a few bugs.

I really like PP, so I will wait and pray, but what they told me is not what they told Lisowski.

While PS is not the fastest language in the world, it's very easy for people and programs using it to slow it down unneccesarily with font changes and rotations that could be avoided with better planning. I have no idea if this is what Cricket does, but some programs will draw a string of text in font A, draw a string in font B, and then go back to font A, etc. It's better to do all your work in font A and then do all the work in font B, etc, saving a lot of calculations.

I know people yell about PS's speed a lot, but the LaserWriter can print a full page 256 grayscale halftone image in a few minutes, so it can't be all bad.

From: Robert.Lisowski@rubbs1.FIDONET.ORG
Message-ID: <35.2317D326@rubbs1.FIDONET.ORG>
Source record: 251009

I use Radio Shack cat # 42-2151 ($4.99) six foot DIN patch cords as MIDI cables. They are 5 pin, and each pin is independent, just fine for MIDI cables. Of course, if you need longer cables, you can buy the connectors alone, but the 5 conductor shielded wire is not available at Radio Shack.

People experiencing problems with their midi ports should try these cables to make sure it's not a cable problem. Some MIDI cables are cheap, and the pins are not always independent. Hope I save someone a trip to the repair center.

Dear John,

There is really one little problem with the code you have written, that being if
the block you Malloc is just one byte past a 256 byte boundary, then you will
be wasting 255 bytes, therefore you will need to Malloc at least (32K+255) to
insure that you have at least enough memory to draw a full screen in. Other-
wise you will be overwriting memory which is not yours (a discussion of which

there has been an abundance of these days :-).

This is also simple to implement. Just keep the tables in RAM.

If you use more than one patch, using the original vector in ROM will
fail (the first patch applied will never be executed).

The method I use is simple and 'patch-compatible': save the old vector
(of the trap) in your resident program. Anything that this program
shouldn't handle (most things) are vectored through the old vector.
This might be just a little bit slower (in the old code the function
number parameter gets checked again and so) but it allows for more than
one patch. It is also less likely to get into trouble with new ROM
releases - it's probably not even documented that there IS a function
table (although my ROM also passes your A0 test 8-).

Leo.

I thought we had all this Video Ram discussion in various flavours a
few months ago (maybe you lucky people have vacations that long 8-).
Alignment on a 256 byte boundary automatically implies there is a
worst-case waste of 255 bytes. You cannot avoid that. John's code is
correct however (maybe not intentionally), since a screenful amounts to
32000 bytes, not 32K. So a Malloc of 32256 is in fact satisfactory, and
hence certainly John's 32768.

B.T.W. What I've seen from the initialization of the screen memory seems
to imply that the start of the physical screen is always taken to be
physical RAMtop minus 32K. So there's always a waste of 768 bytes at the
top of RAM. To be used whatfor? A program? Some data? Any suggestions?

Leo.

Laser printers are not slow. Adobe PostScript is no speed deamon, but neither can you blame it for 45-minute print times. If your application cannot get pages out at two minutes a page, there is something wrong with your application.

There are four main reasons presented for the slow speed of laser printers: interpreter overhead, font downloading, graphics downloading, and the serial interface bottleneck.

The interpreter is not super fast (c'mon, Adobe, bind is only half way! Give us a modern forth if you're going to stick us with forth.) But neither is it slow. If you are doing something with the interpreter, you had better have a good reason for it. Don't calculate in the print engine! Use short procedure names for the procedures you use a lot! bind/def when you can. Now, my engine is a QMS PS-810A, which is much faster than a stock LaserWriter, but even the LaserWriter isn't that slow. The PostScript engine is actually quite fast at rendering. I say, if the interpreter is your bottleneck, either you are plenty fast (a minute a page or less) or your application is abusing PostScript.

I'll look at serial interface speeds next. If your printer is restricted to a serial interface, and that at 9600 baud, bitch loudly to your printer manufacturer; they've rooked you. The assholes have really rooked you. You want a parallel interface at least, or, if your computer is up to it, a SCSI or better interface. There is no reason to build a laser printer with just a serial interface, Apple notwithstanding; that one move alone has probably cost more man-hours in waiting for all the people using LaserWriters on parallel-capable machines than they could possibly have saved in engineering and parts costs. Shit, one reason the QMS PS-810A is so preferred is because of that parallel interface! And Adobe, give us a better binary tranmission standard than hex; try something like uuencode-format (with graves in place of spaces) with special characters maybe to indicate run encoding. The printer can eat that up as fast as hex, and you'll save a lot of time for everyone involved.

Graphics is next. If your application includes some heavy graphics, you will be penalized, but in seconds, not minutes! The PostScript engine can draw many, many vectors per second, and it doesn't suck at halftones either. Maybe your software is spending all of its time scaling coordinates? That's what the damned PostScript engine is good for! I routinely draw graphics with hundreds of edges and labeled vertices; they

print plenty fast. 640x400 grey-scale graphics take maybe a minute each. No 45-minute waits here!

The most difficult issue is fonts. Resident fonts are almost free, except the first time you use them before they exist in the cache. (If you use enough fonts to overflow the cache, you probably need to reconsider your typography.) Non-resident soft fonts are a different story. But if you use these, you should download them once at the beginning of each day (or whenever you power-cycle the printer) and *bam* they are resident. Buy another megabyte of memory for your printer if you need to do so. At 50K a font, they will take a minute or so to download, but that's only done *once*.

You've got too many soft fonts? Well, your software should be able to deal with that; it can query the printer to see if the font has already been downloaded, and if not, download it. Once. Simple enough.

Maybe I'm spoiled. But if I had a software package that took ten minutes to print a single page, I'd return it. And buy something that works.

> -- Robert A. Heinlein --

NO NO NO NO NO NO, installing a trap handler is exactly what I DON'T want
to happen. I pointed out already several times that when one bug is fixed,
one extra traphandler is installed, when two bugs are fixed two extra trap
handlers are installed, and so forth.

All these trap handlers checking for the correct system call number to fix
take TIME. Fixing things in a way a la the Mac does not take ANY extra time.

Bugs are generally not discovered all at the same time. So its reasonable to
assume that several fix files would be present. Installing these by taking
the original 68000 trap handler over just takes too much time while
performing lots of system calls.

As you know beta-testers are NOT allowed to comment on the testing,
while I did not sign a formal agreement, I have no intention of
breaking my promise to keep my mouth shut.

From: Thomas_E_Zerucha@cup.portal.com
Message-ID: <8526@cup.portal.com>
Source record: 251018

So what about the SLM804 (or whatever number) the Atari Laser printer that uses the ST's DMA Bus? I have seen it do 5 second screen dumps. But what does it do with something like EasyDraw or Timeworks DTP? Do things which use GDOS to drive the laserprinter go any faster (Atari could sell a lot more systems if their ad went "What takes 45 minutes on brand X takes only 2 minutes on an ST". But does anyone have experience?

5218. Re: I need Binhex in MAGIC format

The latest versions of Stuffit have BINHEX built in. You may be able to get it by calling a Mac BBS and using the mover or transverter to get it onto a magic format disk. Data Pacific now offers a Magic PD disk which probabaly has something that can handle it.

5219. installing mwc C 3.0 on 1040ST with 1 ds/dd drive

Some time ago, some people wrote:
> [UniTerm has trouble Kermit-ing with a VAX]

I thought I'd mention that so far (fingers crossed, knocking wood)
I've had no trouble at all, including a night where I uploaded just
shy of 600K worth of files. I am using UniTerm v2.0.6 on an Atari
1040 STf, nov 85 ROMs, and talking to a VAX 11-785 running VAX/VMS 4.5
using Kermit-32 version 3.1.066, everything in default settings. I
should also mention that all files were ASCII, not binary.

In the 9/88 issue of Personal Publishing Magazine, on pages 34-35, there appears a very attractive 2-page full color ad for the Mega ST series - and it's aimed at the desktop publishing market - not to hobbyists or Atari enthusiasts. It's gratifying to see that Atari is finally getting the word out.

By the way, in the same issue there is a review of all the desktop publishing software available for the ST and the Amiga. There are suppose to be two more articles in a series about Atari and Amiga DTP.

Date: 1988-08-29 00:57:45 UTC
From: rob@raksha.eng.ohio-state.edu
Message-ID: <539@accelerator.eng.ohio-state.edu>
Source record: 251023

Some people had a discussion on Malloc/Fsfirst(next)/40folders from which I inferred that after doing Fsfirst you should always Fsfnext until failure, or you will leave a permanently allocated buffer in your wake. Is this correct? If not, what is the truth? Are there other allocation fee-churs like this?

Second question: is there a way to get docs on the lineA functions, other than becoming a registered developer (that'd be a joke!)? If so, how. If not, why not?

Thanks,
Rob Carriere

Well, Allan, I really hate to rain on your parade again, but this stuff
about the new format being compatible with the PC is just not true...
At least not in the BETA ROMS... I have a disk formatted by the new
BETA ROMS, and though the PC just doesn't barf on it like the old format
used to (e.g. Sector not found), the PC does not like the root directory
at all. CHKDSK reports "XXX clusters lost", where XXX is the number
of clusters used by the files. In short, this still doesn't work. I
suspect that this is just another problem relating to the boot sector,
but I haven't had the time to look at it yet.

I also have been able to determine that disks formatted on the PC
read/write properly with the BETA ROMs though, so all is not lost.
But it really isn't all that much better than before.

>Maybe I'm spoiled. But if I had a software package that took
>ten minutes to print a single page, I'd return it. And buy
>something that works.
>-tom

I found this article quite funny. The software I have always used
has always printed nicely formatted text at around 6 pages per minute.
(In this case, that is the speed of the LaserJet.)
While I would certainly toss anything that took several minutes to print
a page, I would also do that with anything that took a minute. I find
it incredible that people put up with this sort of thing.

There's no reason you can't have nice typeset text as fast as the printer
can output it. The only reason is badly written software that was never
tested properly for speed. There's little excuse for that.

I guess none of you are contemplating buying the Panasonic laser partner
for the 11 pages per minute. You wouldn't have anything to do with it.

A recent posting describes a way to fix StuffIt so that it will work on your Magic Sac. There is an easier way. Just get UnStuffit 1.40. It works fine, although it's predecessor didn't.

If you need to Stuff as well as UnStuff, I would suggest that you try Stuffit 1.40A, which is kicking around. Again, earlier versions didn't work, and, while I haven't tried it, I would guess that it's pretty similar to the latest UnStuffit. Both of these programs were posted to MACSERVE in around April.

Hello,

we have mega-problems using the cartridge port on our MEGA ST2 and we think it is a common problem for all MEGA's with a boardrevision higher than revision 4. We use the cartridge/ROM-port to read data from an ADC to digitize satellite WEFAX-pictures from METEOSAT. The soft- and hardware works fine on a MEGA ST2 with a revision-4 board or a 1040STf, but it crashes (with 4 bombs) on any MEGA ST2 with a revision-5 board.

Our dealer (ECD delft) and ATARI Benelux (Netherlands) couldn't help us (yet?), so we would like to ask if there is somebody on this net with enough inside knowledge to help us.

5234. Many questions

Newsgroup: comp.sys.atari.st
Date: 1988-08-29 16:25:07 UTC
From: johno@pnet51.cts.com
Message-ID: <30@orbit.UUCP>
Source record: 251035

[Is there still a line eater out there? Or am I just looking foolish?]

Hi out there in Netland. Long time no see. I am back online again by the gracious permission of the sysop of pnet. I can receive mail here, but the prefered place is my school account, lxw6035@ux.acss.umn.edu.

Anyway, on to some questions that I have been building up.

Currently I have 2 projects: a terminal called Lazy Term, and an update of Schizo, it will be v1.5. I am having major problems with both. If I can get some help from people who know better out there, they will both be out soon. On to the first.

Lazy Term (why do we need another terminal emulator?) will be a SMALL, reasonably full-featured VT52 emulator. You will be able to call it up from anywhere with a key combination. I am debating XMODEM capability, but it will surely have macro capability, and dialing capability (automatic redialing, RS232 settings PER PHONE NUMBER, etc). It also will answer like a real VT52 (for those of you that use qterm on UNIX). Most everything is working, except for the most important part, calling it up! <grin> At first I was going to make it a desk accessory. But then I had major problems looking for a key combination from the desktop (anyone know why the Desktop ignores MU_KEYBD events?). So, I decided to try and put a keyboard intercept in. No go. I have never messed with interrupt routines before, so I don't know what the problem is. Right now, I can't even install a dummy routine. I am replacing the routine that I find from Kbdvbase in the kb_kbdsys pointer. I use Mark Williams' C, and the setrte routine (which saves registers) first, and then pass control to the original routine after finishing. This always bombs out. If anyone can help, I'd be thankful. I am also wondering whether it is safe to use system calls (like Bconout) in an interrupt routine. Any code would be much appreciated.

On to the second set of problems. Schizo v1.5 will have two major improvements: it will have a corner clock, and it will select a desktop.inf file that matches the current resolution. Of course, I am having problems with both. The corner clock is related to the interrupt routine problems. I am using a VBI to keep the clock working in non-GEM programs. I can install a VBI, but am wondering whether it is safe to use system calls within the routine. The second problem is with the desktop.inf reading. Right now, short of reading it myself, the only way I can do this is to rename a file to desktop.inf, and then reboot. Obviously this is a poor answer. Is it the only answer though?

Those are my problems. I apologise for asking. I program to learn. Every new revision or program has taught me loads about how the ST works. I am obviously still learning <grin>.

Any comments, suggestions, and help is welcome. Thanks.

> Are there any (real) BETA testers out there who would like to comment?
> Any news from the *official* Atari mouthpieces? Inquiring minds
> want/need to know...

I was going to let this one go by, since a Developer Release (softloaded)
is imminently available - details are being mailed to all registered
developers. But then I realized this is just the sort of unthinking posting
that starts off a rumor chain and network explosion.

The mature way to handle this concern would have been to call/email me or
someone at Atari, rather than posting what is clearly rumor and hearsay to
an already sensitive group of readers. But no... it seems it is better to
to launch another missile that can only do damage, either to reputations
or to morale. The closing comment is entirely unnecessary, regarding "fix a
few, create a few..". Why on earth do you think we have have an extended
Beta with the subsidiaries? Why do you think we are making the Developer
Release before committing to ROM? This version fixes some bugs found in
Beta, and also includes even more performance improvement.

I have tried to keep a conservative tone to my responses, but the lack of
foresight and thought behind this posting got to me. That and a teething
baby [:-)].

PLEEEEEEASE: before putting this sort of muckspreading out for public view,
get the FACTS!!

Just that nobody gets a wrong impression, ReOrg works quite well, and is as safe as possible, IF you follow the instructions (then it is as safe as your backup program).

While it would have been trivial to add all the fixing and checking code to ReOrg, I've got something against kitchen-sink programs. ReOrg is supposed to be a TOOL to be used together with other programs:

"Power tools are not toys!"

BTW, while your program sounds quite nice, it would fail miserably on two of the four partitions on my HD (guess why...).

Yes, 1.4 is the designation for the new TOS. We did in fact include a note in
a recent posting that 1.1 and 1.3 were never released, for reasons which are
too tedious to go into. Suffice it to say that 1.4 is the new version.

This won't do you a whole lot of good if you're stuck in an OS call,
like waiting for a keyboard character, or doing disk i/o. The window
where the program (user mode) has control could be VERY small, maybe
too small to hit between disk accesses.

> If it's NOT safe, the ctl-delete should be removed from the queue.
> That way, it's like it never happened. This means it might take
> several Ctl-Deletes to stop a process, but the ones that don't
> stop it also won't do any harm.

Then I hit Ctl-Delete several times, maybe letting the key repeat in
order to hit the tiny "breakable" portion of the code, and the program
DOES finally stop, but now I have several "break" keys in the buffer,
and the SHELL I'm running will now break. Maybe the program should be
rigged to clear the keyboard input buffer on program termination, or
better yet, ignore breaks for some fraction of a second after the program
terminates (easy to do by checking 200Hz clock values).

> and the C library's malloc.

This is one problem with malloc()ing from a fixed heap area in the middle
of the program's memory space. For those who aren't familiar with it, this
is a rough picture of a running C program's memory map.

```
low memory
_______________________________ base
|basepage (a.k.a. the TPA) |
|------------------------------|
|text (executable code) |
|------------------------------|
|data (initialized data) |
|------------------------------|
|bss (uninitialized data, zero) |
|------------------------------| break
|heap | |
| V |
| : |
| ^ |
|stack | |
|______________________________| end of program space

high memory
```

The stack grows toward the heap, and the heap is usually allocated by calls
to malloc(). This means Malloc() is not used for dynamically allocated
space within the program. One problem with this scheme is that the program
must know at startup how much space it will need for it's heap. Also, any
space reserved for heap cannot be used by other programs executed from
within this program. And finally, there may be PLENTY of free memory still

available in the system (throuh Malloc()), but when you're out of heap,
you're out of memory.

> I could however imagine a malloc that uses Malloc to reserve memory not
> currently owned by the program... A clever one can even hide some of
> the defiencies of the current Malloc (especially when it Malloc's in
> big chunks so that it doesn't have to be clever too often, as
> cleverness takes time 8-).

The dLibs malloc()/lalloc() functions do this. A global variable, which
defaults to 64K allows the programmer to set the "granularity" of the
calls to Malloc(). Calls to malloc()/lalloc() allocate a series of "heaps",
each at least the grain size (lalloc() may specify a block bigger than
the grain size) from which subsequent malloc()/lalloc()s are satisfied,
with only 4-bytes of overhead per memory block. I've used these routines
in a MicroEMACS implementation (which malloc()s each line) and never had
a problem, even when adding/moving/deleting large amounts of text. In
addition, this scheme allows almost ALL of unallocated memory to be used
by programs executing from within another program. Allocation from the
heap is also available, through brk()/sbrk(), and another global variable
defines the size of the heap/stack area. Best of all, the source code
for these routines is part of the public domain dLibs C runtime libraries.

5242. Checkbook/budget program

Newsgroup: comp.sys.atari.st
Date: 1988-08-29 19:49:50 UTC
From: gibson@trwrb.UUCP
Message-ID: <7739@trwrb.UUCP>
Source record: 251043

I have a Checkbook/Budget program that I wrote for the St.
This program was designed to make computer checking easier than hand
checking. This program will:

*Print on checks
*Maintain a checkbook database
*Includes a emacs like data base editor
*Flags each database transaction as a check, deposit or budget item.
*Maintain a separate list of budget items and check items
*Balance checkbook
*Perform global database editing, (i.e. change the month on a group
of items etc.)

After I add a checkbook interface to enable people to write on their
particular checks, I will post this program. I use fan fold checks.

The budget part of this program is based upon the idea that most of
my budget can be computed via my check. Actually, the budget part of
the program is more like expense monitoring. It allows each transaction
(i.e. deposit, check, or budget item) to be part of the "budget".

The other point that Gert and others miss when they talk about replacing OS routines is the close coupling WITHIN THE OS between, say, Malloc and the process handler. You can't just rip out Malloc and change it because other parts of the OS depend on it being exactly as it is. That doesn't mean the OS is a monolith; it's not (much). But some crucial data structures pervade the whole thing, and others are tightly coupled among a few modules. Somebody else asked this same question about Pexec, and the answer is the same: it's tightly coupled with other parts of the OS (not just Malloc).

I second this, but would like to add that we DID fix the very bug Mr. Drapal mentions between the BETA ROMs and the Developer RAM release. So not only don't we want this stuff on the net, but we ARE responsive when we get feedback through channels. (It didn't come from Mr. Drapal.)

I infer from Mr. Drapal's simley faces that he DOES have a copy of the ROMs. Pity he didn't also bootleg a copy of the instructions for submitting problem reports to Atari.

Tyler Ivanco and I (Avygdor Moise) have designed all the hardware
and software necessary to attach any SCSI hard disk (or tape drive) controller
to the Atari ACSI-DMA port. This adapter comes assembled and tested
or as a bare PCB + one PAL. We also have developed a high performance hard disk
interface and formatting software. We make this board available to all
interested hackers for only $150.00 (assembled and tested) or $99.00 PCB.
Both the assembled and unassembled versions come with a comprehensive
installation and programmer's manual (30 pages) and a very high quality
software kit.

> insure that you have at least enough memory to draw a full screen in.

The continuing misunderstanding here is that people think the screen takes up 32K bytes, and (in Erasmo Brenes' case) that the screen memory must start on a 32K boundary. The screen takes up 32000 bytes, not 32K (which is 32768 bytes), and needs to start on a 256-byte boundary. The upshot of this is that you only need to allocate 32256 bytes to be sure that there is a 32000-byte block on a 256-byte boundary in there somewhere. Since John Joubert's code allocated 32768 bytes, it worked fine.

I appreciate this discussion because it shows that people care about doing The Right Thing about allocating memory. The Wrong Thing which some people do is assume that consecutive Malloc calls allocate contiguous memory. This is accidentally and unfortunately true in current ROMs, and part of what I had to keep doing because people came to rely on it, but it is not correct to assume it will go on being that way.

Moreover, you have to watch out for future Atari video modes which use more than 32000 bytes for a screen, and/or have different (probably more relaxed) restrictions on the screen-memory base address.

> other allocation fee-churs like this?

You haven't been paying attention, but that may be symptomatic of other people so I'll reply (again) here.

Fsfirst/Fsnext has NEVER been the culprit in the 40-folder bug. GEMDOS has NEVER had a concept of folders which are "in use" versus folders which are not. It allocated internal memory for a folder as soon as it came across it: getting a directory listing of a directory with subdirectories caused memory to be allocated for those subdirectories. This memory was NEVER released or reused.

The new GEMDOS (in the impending TOS 1.4 release) *does* have a notion of "active" folders, as I have described here before. I totally reworked Fsfirst/Fsnext so they do NOT contribute to the definition of an "active" folder, and therefore you do not need to exhaust an Fsfirst in order to relase any resources it has locked -- there are no such resources.

Go back and read my previous postings for more details.

>laser printers. They are not fast; they just sound that way.

This is bologna! Laser printers are fast, if all you want to do is what
other printers can do. i.e. text and low res graphics.

If you want to 'take advantage' of the capabilities then it slows down.

There is however, an advertising technique which make them sound even
faster than they actually are. It's "n pages per minute".
A 10 page per minute laser printer can print 10 copies of the same
page in one minute. That does not include transmission time or page
layout time.

It appears that I wasn't quite clear in my last posting. The archive at Euterpe is only a temporary archive where people can submit programs et cetera before our "real" archive opens. Thus, it is a mess and there is no index. Its a shareware archive, if you find something useful there then send something back. All GCC stuff is there, so is Flex, Diff and Patch.

Second, if you want to submit something via BITNET then send things to USERPC7@UMICHUM.BITNET . We aren't ready to send out files yet, but if you want to submit a file, that's the place.

5252. PC compatible(?) format on the ST

Newsgroup: comp.sys.atari.st
Date: 1988-08-30 02:56:47 UTC
From: med@druhi.ATT.COM
Message-ID: <3461@druhi.ATT.COM>
Source record: 250953

First off, this is a followup to a posting I made yesterday regarding the incompatible PC format from the new BETA ROMs. Allan Pratt claims that this is fixed in the new BETA ROMs, and indeed it is -- that is if you never want to store a file on it!!!

After a little bit of investigating, and some real insightful help from Dan Moore (thanks, Dan), it seems that the double sided format is almost compatible, except that a standard PC formatted disk has 3 sectors per FAT, and the ST formats them with a standard(?) 5 sectors per FAT. Since most (all) MS-DOS systems simply check the format ID (in this case, 0xF9) to get its information, and ignores most if not all of the rest of the boot sector information, the PC thinks that the root directory starts somewhere in the middle of the second FAT on this disk!!! So, CHKDSK is very happy with this disk, until you put a file on it on the ST, at which time it complains that there are lost clusters on the disk (since the first FAT shows them in their proper place, but they aren't in the root directory).

Well, after all of this, I am really wondering how much BETA testing(??) that these ROMs have gone through. You see, I really don't even have a set of these ROMS, and have managed to find what I consider a major bug. Are these ROMs even being tested, or are we all in line for another MEGA ROM snafu??? (you all remember that one, don't you - everything broke including the kitchen sink ;-{). I sure hope that we aren't in for the same thing again - Atari will never be able to live through such a mess again, at least not in the computer market.

After reading lots of messages on the merits of using the 0xAxxx ***RESERVED*** instruction trap, I have to add my 2 cents. Using the 0xAXXX or 0xFXXX traps is bad news. It limits compatibility with future 68000 family products. Apple atleast avoided using the 0xFXXX trap which is why they have had 68881 support for sometime while we still only have somewhat kludged, semi-supported floating point support much less a 68020/68030 version of the ST. If you want to have pointers for each routine, it wouldn't add many instructions to use a legal trap and vector in software.

5256. STedi and Tempus

Newsgroup: comp.sys.atari.st
Date: 1988-08-30 07:32:00 UTC
From: PETCHER@FSU.BITNET
Message-ID: <[gw.scri.fsu.edu].19799400.00918175.PETCHER>
Source record: 250956

I recently received a copy of the most recent issue of the Dutch magazine STart (no relation to the one from Antic) and found something that may amuse some of you, especially if you are familiar with the editors Tempus and STedi.

The magazine contains an article entitled 'Tempus, the fastest scroller' which is a review of the editor Tempus and somewhat of a comparison to other editors on the market. Tempus is an editor that some of you may know is renowned for its speed. In this case the title tells it all. Tempus is the fastest scroller. In the article they state that Tempus is one and one half times faster than STedi, and a chart tells us that Tempus is twice as fast as Textomat and more than six times as fast as First Word (these being the only programs tested). The only other function that is tested is search and replace, and the article goes something like this (my free translation):

"The greatest speed difference is seen in the search and replace command. Here Tempus is some 90 times faster than Textomat. Oh by the way, STedi is somewhat faster, about 900 times faster than Textomat (10 times faster than Tempus)"

Nothing like indirect comparison. I guess that blows it for the claim of Tempus to be the speed king. Although it is the fastest in scrolling ... I think in most functions which have little to do with screen display, Tempus would come up on the short end.

The article does point out quite fairly that STedi has many more capabilities than Tempus, but it is not GEM based (for those of you so bent), and Tempus is available as a stand alone product in contrast to STedi which is marketed as a part of the Craft development package (see other postings recently). Thus if you are not a serious developper, or don't want a shell environment, or just loooove GEM ;-) Tempus may be of interest. Otherwise STedi is the way to go.

Thank you, Simon, for making two points in your (unsolicited) posting:
a) The SPR (System Problem Report) mechanism, part of our PTS (Product Tracking System) database is the vehicle we have put in place for ALL bug reports, enhancements requests etc. for software and hardware. It will be available to all registered developers as part of the Developer Release of TOS 1.4 (and other products). It has been put together with considerable thought, and is a vehicle for mature and professional reports of problems with Atari products. Details will be in the Developer Kit update package. Its primary aim is to provide continuity of problem tracking, and to prevent reports, which have hitherto been verbal, written in various forms or posted on BBS etc (sometimes buried in profanity or similar abuse), from "dropping through the cracks".
b) I had requested that Beta sites be asked to sign non-disclosure agreements during Beta test, with other conditions including no rights to copy or distribute unreleased products. Some subsidiaries insisted on these conditions, for which I thank them, others did not. Nonetheless, the spirit of a Beta test must, of necessity, be one of mutual trust between Atari and the test sites. Simon Poole falls into this category. Others who post to this net do not, and are therefore not considered acceptable sites. I fully intend to formalize the procedure for becoming a Beta site, in order to cut down on the amateur (in the sense of not being professional, rather than of being a "lover") attitude of some responses. We have several new products in development, hardware and software, and I have every intention of being more stringent in the conditions for being accepted as a Beta site for these than I was for TOS 1.4. It would be perfect if all registered developers and selected

end-users could Beta test all products. Not only is this economically unfeasible because of support and product costs (especially with hardware), but it is also impractical to manage. These considerations, in addition to the need for a mutually beneficial relationship, of necessity limit the number of potential test sites.

>Yes, just like somebody posted (in the corresponding newsgroups):
>
> FLEX for the Mac
> Bison for the Mac (They didn't even take the trouble to ifdef
> the changes in this one....)

FLEX is available for anonymous ftp from ssyx, and on the archive
server as of about five minutes ago. If I were to post it, it would
probably be a binary- only posting, because the sources are very large
(~300K). I also have several other GNU utilities here:

```
-rw-r--r-- 1 koreth 143413 Aug 29 08:58 pub/atari-misc/bison.arc
-rw-r--r-- 1 koreth 46210 Aug 29 09:01 pub/atari-misc/diff.arc
-rw-r--r-- 1 koreth 162536 Aug 29 09:04 pub/atari-misc/flex.arc
-rw-r--r-- 1 koreth 305215 Aug 29 08:23 pub/atari-misc/gas-1-20.arc
-rw-r--r-- 1 koreth 1414301 Aug 29 08:55 pub/atari-misc/gcc-1-23.arc
-rw-r--r-- 1 koreth 402305 Aug 24 08:16 pub/atari-misc/gcx-1-23.arc
-rw-r--r-- 1 koreth 140739 Aug 24 08:20 pub/atari-misc/gnulib.arc
-rw-r--r-- 1 koreth 346452 Aug 29 09:11 pub/atari-misc/gnuutils.arc
-rw-r--r-- 1 koreth 91023 Aug 29 09:13 pub/atari-misc/patch.arc
```

The arc files will go away soon, since I don't really have the disk space
to keep both uuencoded and binary copies of this stuff online. Say

index atari-misc

in a message to archive-server@ssyx.ucsc.edu (ssyx is uunet!ucbvax!ucscc!ssyx)
to see how to get this stuff from the archive server.

A caveat to BITNET users: you should say

path user@node.bitnet

in your message so that it will get routed properly. Otherwise it will go
through some unnecessary intermediate sites and possibly get lost along the
way. Also, people on sites in the UUCP maps can say

path site!user

for autorouting.

These are my opinions, and in no way reflect those of UCSC, which are wrong.

> connectors alone, but the 5 conductor shielded wire is not available
> at Radio Shack.

I wouldn't use these cables. Since all five pins are passed through, they sound as if they would be fine for MIDI stuff. But since *all* five pins are passed through, they are prone to cause unpredictable results. For instance, the two 'unused' pins on many MIDI instruments (the ST is included here) are used for non-standard interfacing. For instance, the ST uses there for MIDI-thru. If another instrument uses these same pins for something else, it could create havoc.

Of course, if you get these cables, you could cut the wires to those pins...

Help!!!

My hard disk crashed because of the 40 folder limit.

I know, I should have used the fix but I was being very careful :-)

So. When I boot up the st, I just get 0 files, 0 bytes used on the hard disk.

I can't get any of my old files on the hard disk.

I will reformat the hd, but I would really like to get some source
files off of it. Can I? Perhaps with a sector editor?

Thanks,
Nick Kline

>We're talking about printing GRAPHICS on the laser printer. Graphic images
>DO take a long time. Noone said that text prints at ten minutes a page.
>Please pay attention.

Well, while everyone is laughing - there are two kinds of graphics - pictures, and letters that are "drawn" on the page. When the atari laser printer finally hit the stores last January, I had a few $K burning a hole in my pocket, and gave it a lot of consideration until I went to a store and saw it take about 10 minutes to print out a page using one of the page makers (Personal Publisher I believe) which was mostly text. Since the computer was essentially dead for that time, I walked away and bought something that would keep me occupied rather than bored - a Mac.

Rasterizing a page is a *big* job from the processors point of view. Bad programming makes it worse, but don't expect to see 8 pages a minute if you are doing anything extraordinary. If the laser printer that you have has a text only mode, or an epson emulation mode, then you can probably pump pages out. But, if that is all you are doing, there are many more cheaper ways to get the output.

I have been using MWC on a i ds/dd system since I got MWC v1.0. I (like you must) use a 512K, bootable RAM disk (boy that bootable RAM disk makes Desk Accessory programming almost pleasant!). I had no trouble installing 3.0.6 from the install program. I was using v2.1 though. I suggest that you give them a call. They have a toll-free (like all REAL software vendors should) support line. The number is 1-800-692-1700. They are very helpful, and if you need a newer version (I have not heard of v3.0.1), they will send one out free in all probability. They really do have the best compiler around!

In article <571@laura.UUCP> markhof@exunido.UUCP (Ingolf Markhof) writes:
>The Lattice C compiler prints its error messages on the screen. This is only
>less helpful. I'd like to get the error messages written into a file. So, how
>can I tell the compiler to write such a file?

I don't have the newest version of Lattice C, so things might have changed...

If you start LC1.TTP and LC2.TTP yourself (I mean: not using LC.TTP) you
can use redirection in the command string offered to these programs (they
handle redirection themselves); e.g.

```
LC1.TTP >error1.out lc1_options myfile
LC2.TTP >error2.out lc2_options myfile
```

Note that the redirection must be the first argument, or it will be
misinterpreted. Also note that you have to quote the '>' if you're
running from a shell that handles redirection (<,>,<<,>>), or else the
shell will try to do the redirection (which might fail).

There's another annoying fact about Lattice discriminating between console
and file output (again, maybe it has changed):

If you use LC.TTP to compile, you will notice it will wait for a keypress
before finishing. This is quite annoying if you run from a make program, or
use batch processing. I can understand why it has been done: to be able
to see the compiler output before returning to the Desktop.
If you use LC1.TTP and LC2.TTP to compile, you will see they also wait
for a keypress before finishing. The odd thing is, they don't wait when
started from LC.TTP (this one starts them each in turn). The reason is
that LC.TTP starts them each with a first argument of '>CON:'; this
value is treated as a special one by both LC1.TTP and LC2.TTP.

When I found out about all that, I decided to write my own cc program
that starts the LC1.TTP and LC2.TTP with a first argument of '>CON:',
also starts the linker LINK.TTP with a suitable link description file,
handles its parameters more 'a la Unix' and DOES NOT WAIT FOR A KEYPRESS.
(If someone's interested, mail me).
The output is still directed to the console, but that's no problem:
if fastdump.prg is installed (can even start it at that moment) an
Alt-Help will do a fast ascii screen dump to my printer, which is even
nicer than having error messages in a file (unless you have something
like the Unix utility error that can merge an error file into your
source file).

Hope this helps you out -
Leo.

> while I did not sign a formal agreement, I have no intention of
> breaking my promise to keep my mouth shut.
>

Well, Simon, since you are the only person I know who sounds like they might
just be a beta tester ;-}... Seriously, this bug and another regarding the
PC compatible diskette format, rank right up there as bugs which should be
found in 5-10 minutes of developer testing (e.g. Allan and Co. should have
found these). This indicates two things to me: 1) the level of developer
testing was probably done by the compiler ("It compiles, let's ship it..."),
and 2) there may be *NO* official beta testers out there (I know of a number
of unofficial testers out there, but I fear this is another MEGA ROM fiasco).
While I never expected to hear that the BETA ROMs were bug free, I would
expect that bugs which were reported months ago have had sufficient time
to be tested and fixed (like PC compatible format... Oh, by the way, have
any of the testers checked to see if the disk free function works properly
yet - the old version reported number of free bytes off by at least
2 clusters).

By the way, I didn't intend to imply that you should break your promise... ;-)

>
> - Mike

Actually, the screen memory takes up 32000, not 32768 bytes (I got that from
a previous discussion.) Therefore, if you can malloc() 32K (32768) bytes, and
waste N bytes at the beginning, you have 768-N bytes of "padding" at the end
before you have to worry about touching memory which you don't own. Easy to
make this mistake (lucky motorola didn't call the processor the M69632, huh?)

5280. ANIMATION QUESTION

Newsgroup: comp.sys.atari.st
Date: 1988-08-31 16:37:47 UTC
From: Robert_L._White.ESXC15@XEROX.COM
Message-ID: <880831-204234-3799@Xerox>
Source record: 250980

I have been playing around with graphics lately and have some questions about animation. Someone tell me if I am figuring this out right.
Since the screen is redrawn every 60th of a second, and I was to move a Line A sprite 1 pixel at a time, this would give me a movement of 60 pixels per second, right? Thus it would take about 5.3 seconds to move accross a low resolution screen, Right???

My question here is, How do I make the sprite move faster than 60 pixels per second? Is it possible? I have tried moving the sprite 2 pixels at a time, But then the sprite seems to be a little jirky or blurry. I have looked at some games, and some of them seem to be able to move images faster than this without the blurr.
How do they do it? What are some of the tricks?

The way I am doing my animation is this. I am using 3 screens. One holds the background picture, one is the drawing screen (LOG BASE), and one is the screen being viewed (PHYS BASE).
For 1 animation sequence I copy the background screen to the LOG BASE screen, then draw my sprite to the LOG BASE screen, Then do a SETSCREEN to swap the PHYS BASE screen with the LOG BASE screen.
Thus the old PHYS BASE screen becomes the new LOG BASE screen and the old LOG BASE screen becomes the new PHYS BASE screen.
This is then repeated every vertical blank, and every thing works great, with no flicker (at 1 pixel per Vertical blank).

I am writing my code in 'C' and assembly. The background screen copy routine is in assembly (for speed), and the rest is in 'C'. I am pretty sure I am doing all my animation before the Vertical blank, and am executing the SETSCREEN command every vertical blank, (60 setscreens per second).
I have verified this because I seem to be able to move 60 pixels per second.
If anyone can give me some tips on how to move a sprite faster, it would be appreciated.
Thanks,
Robert L. White, Xerox Corp.

5281. PC Ditto/Quattro question

Newsgroup: comp.sys.atari.st
Date: 1988-08-31 16:59:17 UTC
From: gert@prls.UUCP
Message-ID: <14749@prls.UUCP>
Source record: 250981

My wife needs to use 'Quattro' (the IBM PC spreadsheet) for a class project, but we have only an Atari/ST and Apple][at home... No way I'm going to buy yet another already outdated computer.

Questions :

Is there/are there spreadsheets on the Atari/ST that are compatible in user interface with Quattro ?

Will PC-Ditto work reliably for Quattro, and is it reasonably fast doing so ?

Please respond by e-mail to 'gert@prls.UUCP' (..!pyramid!prls!gert). Thanks.

Could someone please supply me with Data Pacific's (the people
who sell Magic Sac) address?

Also, I would appreciate very much hearing from anyone who has used
Magic Sac or Aladin (the Mac emulator from Germany). The most
obvious advantage of Magic Sac over Aladin seems to be the availabity
of the Translator/One (?).

Thanks in advance.

> ST.

Don't be silly. Using line-F has nothing to do with upward mobility
of the ST to 68020/68030, because such machines will have more ROM space,
so Line-F won't be necessary. It does make plugging a 68020 into
an ST tough, but that's already tough because of stack frame differences.
Somebody in Germany did it... I don't know how they got rid of Line-F
and still crammed the OS into 192K of ROM, but they did.

Motorola explicitly reserved the $Axxx instructions for machine-specific
use (as opposed to "reserved for Motorola use" like $Fxxx), so Atari
isn't stepping on any toes there.

PLEASE DO NOT USE NEWS TO REPORT BUGS IN UNRELEASED ATARI PRODUCTS.
PLEASE DO NOT USE NEWS TO REPORT BUGS IN UNRELEASED ATARI PRODUCTS.
PLEASE DO NOT USE NEWS TO REPORT BUGS IN UNRELEASED ATARI PRODUCTS.
PLEASE DO NOT USE NEWS TO REPORT BUGS IN UNRELEASED ATARI PRODUCTS.

Am I making myself clear?

If you have a comment to make about Beta ROMs or any other unreleased
Atari product, use the appropriate communication channels: in this case,
send us an SPR. If you don't know how to do that (for example, because
you copied the ROMs without copying the instructions for reporting about
them) you can mail us a letter. We probably won't even prosecute
you or the official beta tester who let you copy the ROMs, because we
want the feedback. This is not a legal opinion, but it would be my
recommendation. But you do not get any goodwill by flaming us in
public about UNRELEASED products.

Please cut it out.

I post this in public because the offense was committed in public. I am
also sending mail, because that is far less likely to be overlooked by
the intended recipient.

5285. how to switch on the mouse pointer

Newsgroup: comp.sys.atari.st
Date: 1988-08-31 19:04:32 UTC
From: roeder@sbsvax.UUCP
Message-ID: <621@sbsvax.UUCP>
Source record: 250985

Hello!

I have some problems with the mouse pointer on the st screen. In a shell i use graf_mouse(M_ON) / graf_mouse(M_OFF) to switch the mouse on and off. But some programs are disturbing this scheme. After a run of such a program the mouse pointer remains hidden. I've also tried to use the line-A functions showmouse() / hidemouse() and the VDI-functions v_show_mouse() / v_hide_mouse() in various combinations, but then i got damaged menus. It seems that the mouse pointer is on, but the AES (especially the menu-manager) does not know about it. Since GEM-Desktop has no such problems, there must be a way to turn on the mouse in the "right way".

My question: has someone solved this problem ???

Hi netlanders.

Recently I bought an ST-1040 which I'm very pleased with. In Sweden there is as far as I know no user group supporting the ST. Therefore no PD programmes are availible for me. I don' own a modem and can't connect my ST to USENET.

That why I'm posting this message.

If you read this and can help me with info on the following subjects, please send email.

- Are there any good magazine concerning the ATARI ST published in your country? How much do they cost and where are the published?

-- Do you know any USER GROUPS which can support a Swedish membership?

__ Do you know any adresses to sources for public domain etc. programmes?

__ Are you willing to exchange programs with me?
(public domain of course)

If I receive much information concerning the above I will compile the answers and post it here.

For everybody who are willing to swap programs with me I will compile a list of availible programs so both of us will benefit from this.
This last idea is first of all directed to you guys in Scandinavia and Europe, which there is a fair turn-around-time with mail etc.

Please help me. The ST is of no use for me at the moment.

> 800/400's. It was the illegal system calls written in by the "Software Engineers" at
various
> companies that caused all the grief.

> rich andrews

I had a bit of experience in that area (the Apex HP Calculator program
actual did a JSR into the middle of an instruction in the floating point
ROM -- and of course if you change the code to speed it up, that is one
of those things most programmers will overlook!).

But to get back on track, all the discussion so far on the problems Atari
is trying to face with this upgrade of TOS ROMs are in fact illegal system
calls (or accesses generally) and really should not have ever been released
by whomever wrote the code... They were though, so now we have to decide what
to do next --- live with a chunk of trash in the ROMs or throw it out (and with
it yesterday's funnies, since someone wrapped the catbox contents in them before
I read them !!!

I can live with either decision, but the stink lasts a lot longer than the
pain of lost gratification this month.

Simon Poole writes:
>while your program sounds quite nice, it would fail miserably on two of the
>four partitions on my hard drive (guess why?)

If they are some kind of partitions for a Mac emulator or Idris or OS/9, m
program wouldn't recognize them at all. There is a HD optimizer for the Mac,
(Symantic Utilities) but I haven't tried it. There are many for the PC, so
one that runs under PC-Ditto should work too. I don't know about anything
for Idris or OS/9 or any other type.

If you check out most of the optimizers for the PC (those that I know about),
no matter how "safe" they are they recommend backing up first and rebooting
afterword, just because no matter how "safe" my program might be, I can't be
sure that someone else has figured out a way to compromise the safety, for
example a non-writethrough cache would wreak havoc if my program aborted
aborted before it had a chance to update. Also if directories happened to be
cached and it didn't recognize a media change or something and rewrote the
old information over the reorg'ed FAT's, it would also trash the disk.

As for my utility, I *HAVE* hit reset right in the middle of the optimization
without data loss, and the worst that can *theoretically* happen is extra
:"orphaned" files which I have also gotten when hitting reset. It is designed
to be this robust and foolproof, but fools can be even more clever. We also
have something in this country called tort liability which I have never had
the chance to be part of, and never want to, but I have to be careful with
my claims simply because of this. Even if it is 99.98% reliable, I can't
take a chance on not disclaiming all this stuff.

Benchmarking laser printer speeds and 'through-put' speeds is a kettle of
fish. Worse than attempting to benchmark systems and processors. :-)

I recently did some simplistic timings to start to get a handle on things.
I created a document in Timeworks Desktop Publisher and printed it on three
lasers and one ink jet. The results are interesting to say the least... :-)

Atari SLM804 1.33 The results are in minutes.seconds. The
NEC LC-890 5.54 LC-890 was running PostScript, the Roland
Roland LP 1100 14.52 is the same as the Panasonic, all output
HP DeskJet 20.44 was done via GDOS and appropriate drivers.

So. What does this tell us? (Besides that the SLM804 is the fastest :-)

First we need to take a look at how things work under the hood and at exactly
what is going on. When TWDTP (Timeworks Desktop Publisher) prints, it opens
up a virtual printer workstation, executes the necessary commands to 'draw'
the page, and then gives a 'print the page' command.

During this time, depending on the device driver used, several different things could be happening:

The SLM804 driver simply allocates a bit-map the size of a page, draws to it, then sends it to the printer at approx. 3 mega-bits-per second. If the other drivers worked this way, then we see why the SLM804 is faster. The maximum speed that you can send data down a parallel port is 2000-3000 bytes a second. A full page bit-map is approximately 990,000 bytes - but that is still only about 5 minutes (it appears that there must be an inefficiency somewhere in here when it comes to output devices with HP LJ emulation :-)

The GDOS PostScript driver simply translates VDI calls to PostScript code and sends it down the serial port.

The major bottle-neck in printing and through-put speeds is getting the data, a representation of the data, to the printer fast enough. Ventura will generate over 150k of PostScript code for a semi-interesting page with two line art graphics and some text (do a print to disk on the VPSCOOP document to see what I mean). The laser then must interpret this PostScript program and render an image into, guess what, a 990,000 byte bit-image of a page. As a result of this, some (most!) laser printers are more powerful computers than the machines they are hooked up to.

Printing a page of raw text, especially listings and letters, is a snap for a laser printer. It dosen't have to do any real work. Simply blit the font image data to the page buffer, or even do it on the fly (as some of these lasers with less than 1 meg do). Tricks can also be used to do some bit image graphics with a laser with around 512k of RAM. Some software, like Ventura, uses these and other tricks to get acceptable looking output and printing speeds on HP LaserJet's and compatibles.

My next step in benchmarking lasers will be to create the same page that was originally done with TWDTP under Ventura, and possibly a few of the other packages that out there in the PeeCee/MessyDOS & Mac worlds, and time the printings.

A couple of months ago, my father came to visit me in Berlin from Argentina. Since I want to interchange E-mail with him and the rest of the gang regularly, I gave him a 520 STM to take home (It's a model that came out here in Germany, 512KB, no integrated floppy but with an RF modulator. I don't know whether this version is sold in other countries). Since both Germany and Argentina use the PAL color encoding scheme, I thought there would be no problem using the TV set. However, he tells me he can't get any color on the screen. This reminded me that, although the norm is the same, Argentina uses PAL-N while Germany uses PAL-B. Does anybody out there know what's the difference? Can this be the cause for the lack of color? If it is, is there a simple fix I could apply when I go there on vacation? (I used to be able to decode the value of a resistor, given the color-code table and a couple of days, and my theoretical knowledge is even worse, so it better be real simple)

Hi there,

I have a little problem with my ST. I have made a cable that connects
Atari RGB signal to the television with SCART (EURO)-connector. It works
fine, but sometimes (yes, not always, but still very often) it has shadows
on the screen (4 or 5 usually), though they can be seen only with dark
stuff on light background (i.e. in normal Desktop or file selector box).
But it is still so noticeable effect that I want it off. So what can I do ???

If somebody would like to know some details to solve this nasty problem,
I'll be happy to send more detailed explanation, but I think the problem
is the cable (8-wire flat cable, length about 2.5 meters). Or has someone
made some special connections to make it work ??

I also can post details of the connection, if someone wants to do it for
him/herself, but I think it is so well-known connection in the 'big world'
that even this question can be stupid. But anyway, please help me!!

THANKS IN ADVANCE!!!!!!!!

-Antti Nuoreva,
atn@dycom.FI

> ---

Roy, you don't seem to really understand the problem Myron was
trying to point out. The problem isn't the two (three if you count the
free space calculation bug he mentioned) bugs that Myron mentioned.
The bugs aren't all that major, I'm sure they have very simple, quick
fixes. The problem is with Atari's method of developing and testing
code. These are the kinds of problems that SHOULD have been found back
in unit test (testing by the developer). Didn't Alan have an IBM PC with
a 3.5" drive sitting beside him when he wrote the new format code? Or

even an ATARI PC? I could accept a problem with the format that only occured with a single version of DOS or if you had a strange number and arraingement of files on the disk. Those are the types of bugs that you should be finding in Beta test code. Not fundamental bugs that indicate that the code was never tested at all.

When you say something is in Beta test you are saying that it is almost ready to ship. The only bugs should be small and realatively obscure (eg. program A breaks if it is run with desk accesories B, C and D on a machine with 2.5 meg of RAM). But the primary features of the code (eg. formatting PCDOS compatible disks) should already work.

Please listen to what Myron is trying to tell you. One of his jobs is working on development methodologies for large projects. There are lots of differences between developing a small piece of code, like the 192K ST OS ROMs, and a multi-megabyte piece of code. But there are also a lot of similar issues, such as how you should test the code in order to develop a quality product.

Fsfirst/Fsnext have always been a big problem with the 40 folder
limit. Since the DTA contains a pointer to a directory node, a node is
"used" while in a Fsfirst/Fsnext loop. Those programs that didn't call
Fsnext till a failure caused a LOT of nodes to be lost (even more than
"normal"). Some early versions of GDOS had this problem, they could
cause 20 to 300-400 nodes to be used while the ST was booting (the
numbers varied based on the files/folders on the boot drive).
Apparently they did a Fsfirst to get file size information which tied up
a directory node entry forever.

Seconded. I've been watching the debate about Malloc et al, and if
their responses on this are an indication of the general level of work
that has gone into the new ROMs, they should be 200% better than before.

> By the way has any one heard what the status of minix is?

No, haven't heard for sure. Andy Tannenbaum is back home, so we may hear
soon. However, figuring I would rush to the front of the line, I
already sent my order form from the back of The Book (suitably modified
to order the Atari version) and a cheque. I'll let you know when they
cash it. :-)

5297. How to compile Omega and get it to work properly.....

Newsgroup: comp.sys.atari.st
Date: 1988-09-01 16:18:37 UTC
From: whitbye@cs.glasgow.ac.uk
Message-ID: <1601@crete.cs.glasgow.ac.uk>
Source record: 250997

Can anyone out there tell me how to compile Omega on the Atari ST, and actuallget it to work.
I can get it to compile and link, but unfortunatly it gives me some
kind of address error when I run it. Any help would be received appreciably.
By the way, why do people keep saying that the Archimedes is so much better
than the ST when it costs so much more. After all a Cray anything is so much
better than an Archimedes.

ps
Borf is here.

Dear Mr. Drapal (and fellow net readers),
Since you are so insistent with your desire to post comments on the performance of a set of ROMs which you do not have, which is somewhat akin to publishing a road test report on a Testarossa you have never driven, might I ask you to make one final posting?

Please post the name and contact address of the person or company from you which you obtained either:
the unauthorized copy of the ROMs
the unauthorized copy of the RAM version ('tho you say "ROMs")
the source of the report which you are publishing, if it is not you
Also, please post the identification code of the TOS version.

I'm taking a risk - you may have got it through Atari even! But I think you owe it to Atari and to the more responsible subscribers to this news category to be less secretive. For all I know, you may have a bootleg copy of a development-in-progress version.

Incidentally, all Atari subsidiaries received copies of the Beta kit, and have since received copies of the Developer Kit. There will be further improvements and, yes, some bug fixes, prior to comitting to ROMs. If each subsidiary has just 5 external sites (and I believe that is the minimum anywhere), there are at least 70 testers. And we have received some quite obscure bug reports from them, and we thank them for their support. This last word should be in 28 point bold underlined type, as it encapsules the spirit of Beta test - the desire of the test site to support the supplier in the aim of producing a quality final product.

> You're whetting my (and probably others') appetite for the new
> ROMS. Naturally some bugs have shown up now that you're in Beta
> test and you probably have some idea how to fix them. So, Please
> give us a preliminary date and the terms for its
> release. Also, please give us a new list of bugs fixed and not
> fixed (the last one I saw was several months ago.)

The Developer Release is essentially now available via Cindy Claveran for
$20. This include TOS 1.4 DR on Floppy, release notes, revision to MadMac,
revision to "aln" linker, first release of own own "db" object level debugger,
Product Tracking System interface and guide, and SFP004 (68881) deevloper
kit with demos. The $20 deal is only available to registered developers.
Details are in the latest Atari Forum (Developer Newsletter) which was mailed
earlier this week.
The Developer Release contains many improvements and fixes over the original
Beta release of mid-May, but we do know of some discrepancies. These will be
fixed before committing to ROM, and I intend to put a short "known problem"
list in these kits, so maybe we won't have to have worldwide postings. The
Developer Version of TOS 1.4 is considered "unsupported", but this is only
because the ROM version (and its associated RAM version) must be held
as the definitive work. The Developer Release has an Alert box to this
effect on booting.

5300. 1040 Memory Expansion

Newsgroup: comp.sys.atari.st
Date: 1988-09-01 16:32:04 UTC
From: ralph@lasso.UUCP
Message-ID: <8809011632.AA04341@inria.inria.fr>
Source record: 251000

I once asked a question concerning this subject, but no one on the net answered. Is this because it's not worth it to expand the memory versus buying a Mega-2 or Mega-4? Or is it because I posted my question during the summer vacation period? Anyhow, now I would like to know if any company/person is thinking about putting one megabyte SIMMs (like those used in Sun 3/60's and Sun-4's) into an Atari (especially 1040)? Seeing their small size, they and their control chips might fit into a machine w/o cutting a hole (:-% - inquisitive, yet innocent). As always, reply directly if possible, or to Info-Atari16 Digest (comp.sys.atari) since I have no access to `news'. ;-{

>Somebody in Germany did it... I don't know how they got rid of Line-F
>and still crammed the OS into 192K of ROM, but they did.

Perhaps they used line-A instead? There can't be THAT many line-F traps --
certainly not enough that you couldn't use A100 and up instead (assuming that
the documented line-A calls are the only ones that are used; but even if there
are undocumented calls, I find it hard to imagine there being enough of them
to stop this from working...) That seems like a nice clean solution to the
problem to me.

These are my opinions, and in no way reflect those of UCSC, which are wrong.

Since you reveal that you have read either my mail or my posting, you can't claim that you didn't see the (rather restrained I thought) request that you stop posting comments about unreleased Atari products to the net.

I withdraw my recommendation that you not be sued.

This is really unforgivable behavior, and you have demonstrated (over and over) why we have to be very careful in selecting Beta test sites. Apparently we were not careful enough, because either someone talks with you about the ROMs, or someone allowed you to copy them. Be that as it may, I can find no explanation for your continued bad manners, but bad manners should never be allowed to go unpunished.

PLEASE STOP POSTING TO THE NET.
PLEASE STOP POSTING TO THE NET.

This is not an attempt to "hush up" deficiencies in the new TOS which you obviously consider important.

THIS IS AN ATTEMPT TO SHUT YOU UP BECAUSE YOU DON'T KNOW WHAT YOU ARE TALKING ABOUT, to wit:

[MEDIA DESCRIPTOR BYTE] "DOS internal routines use information in the BIOS parameter block (BPB) to determine the media type of IBM formatted disks rather than using these values. THESE MEDIA DESCRIPTOR BYTES CAN NO LONGER BE GUARANTEED TO INDICATE A UNIQUE MEDIA TYPE." [Emphasis mine.]

[GETBPB] "The device driver checks the boot sector. If the boot sector is for DOS 2.00 to 3.30, the BPB from the boot sector is returned."

-- pages 2-27 and 2-30, IBM PC-DOS 3.30 Technical Reference

We never promised DOS 1.x compatibility. The information in the boot sector includes, among other information, the number of sectors of FAT on the disk. The media descriptor never defined that, except in some nebulous way which IBM/Microsoft never documented.

I am tired of discrediting you publicly. If you must report these things, please MAIL to atari!pts and request feedback. We will endeavor to reply, in loving detail, why what you're reporting is not a bug, or, God forbid, that it is. And we will thank you for the time you spent investigating on your own, to be sure it wasn't just a misunderstanding

on your part.

I hope that the rest of the net is as tired of this as I am, and will never take you seriously. That will save me (and Mr. Good) the trouble of discrediting you still another time.

No! Try:

LC1.TTP -. options... files...

^^-- this is the magic option

If you use the -. option, the compiler doesn't ask for a return on exit.

This undocumented option works on Lattice C 3.04.1 and 3.04.2.
I found this feature by scanning all options letters from 0x21 to 0x7e.

and in article 1423 daanjj@neabbs.UUCP (DAAN JITTA) replies:

>Dave,
>
>The package you are looking for is called CRAFT. CRAFT contains a
>very good shell (called "GPshell") and editor (called "STedi"),
>the last one completely written in assembler (FAST!).
[Description deleted]
>

As an extremely satisfied user, I just want to second the fact that Craft
is an excellent product. Anyone interested in a Unix C shell environment
should check it out. It is almost 100% compatible with the Unix C shell (I'm
repeating Daan, aren't I? no multitasking though) with some very nice
extras such as a built in ramdisk, and disk cache that can be created or
removed from the shell, and an editable history mechanism similar to VMS.

I am curious as to why almost no mention of the GPshell or Craft has made it to
the net, while I often see references to the Beckemeyer Micro C shell, gulam
(understandable since it is public domain) and others. Doesn't anyone else out
there own the Craft package? If someone has a copy of all three of these shells
perhaps you could make a comparison and post to the net. I am sure many would
be interested. Although I don't have the micro C shell myself and I have only
briefly used gulam, I wouldn't be at all surprised from what I have heard if
Craft's GPshell comes out well on top. Anyone up for making the comparison?

This is not to mention Craft's excellent editor STedi (see my recent posting).
Leave it to say that STedi is faster, more usable and easily as powerful as
microemacs or the vi clones available, and contains some features that none of
these have. Heck, if you are really stuck on the keyboard commands of
microemacs (not for you of course, Dave) or some other editor, you can
reconfigure STedi to emulate them without sacrificing any of the speed. But

personally I find the already built in commands superior. Anyone in the market for a Unix shell, especially someone who is not happy with the other editors available would be doing himself a favor to check out Craft.

Disclaimer: I have no relation with ComMedia either other than we purchased a couple copies of Craft from them. They even mail order across the pond.

5305. Taken ABAQ, back to the days of void and vapor.

Newsgroup: comp.sys.atari.st
Date: 1988-09-01 20:16:51 UTC
From: jbone@ut-emx.UUCP
Message-ID: <5643@ut-emx.UUCP>
Source record: 250856
Cross-posted to: comp.sys.transputer,comp.sys.atari.st

So, what's the scoop on the Atari ABAQ?

Back in the Fall of last year and in the Spring it seemed like the world was a-buzz with news of Atari's new transputer-based Helios (UNIX-clone?) work-station. It was supposed to have super-duper graphics and come shipped with (I think) Occam, C (an implementation that supported asynch-parallel prog-ramming), and all sorts of other goodies. One article even said that developer materials were shipping (this was, maybe, April), and even gave an address for ordering docs and becoming a registered developer.

Now, I'm hearing rumors that Atari has stopped showing the thing at the shows, and there hasn't been any mention of the thing in <long time now>.

C'mon guys, let's get that old rumor mill cranking again. Does this thing really exist? Has any body seen/touched/played with one? Or is this in fact just another case of vaporous Atari products, like the thought-controlled video game and the portable, DC-powered holographic video game?

So is this thing going to be released or what? Anybody in-the-know, let's hear it.

[...]
Needless to say, I'm no longer working on porting gcc. (Thanks again to
John Dunning...!)

You're welcome!
Still no word from Richard Stallman about whether he'll
include Atari ST support in the next official gcc release.

It wouldn't surprise me if they don't want to; in addition to fixing
everything that deals in pathnames, starting processes, assuming
knowledge of the format of text files etc, I work for Symbolics, and he
still hates us.
In any case,
since the gcc compiler will compile itself correctly on the ST, I don't
see any reason why g++ can't be ported over now...

Right. I've snarfed GCC 1.25 (that's the latest one for which there's a
companion G++) and am contemplating compiling it up this weekend to see
what happens. However, a problem I expect to run into is that I won't
have anything good to test it on when it gets running. For GCC I just
grabbed a bunch of random C programs from various archives, and tried
compiling them up, reasoning that if they ran, the compiler was probly
working ok. I don't know of a source of C++ code; anybody got anything
they'd like to submit for testing?

> the number of voices is cut in half (because every note is
> being played twice. This has nothing to do with the Dr.T
> sequencer, because it happens when I just turn on the ST.

Check your cables. The MIDI out port on the ST also has MIDI
thru available on some of the pins. MIDI thru is a copy of the
MIDI "in" signal (unchanged). It sounds like you are getting
this instead of the MIDI out signals (which can only be data from
the ST).

MIDI OUT port:

pins 1/3 = midi thru
pins 4/5 = midi out
pin 2 = ground (just for shield of cable)

MIDI IN port:

pins 4/5 = midi in

"... But the PC only checks the media descriptor byte and if it is F9 then it assumes that it is a standard PC disk with 3 sectored FATs..."

I wrote a utility and put F8 for the media descriptor byte (normally only for Hard Disks), and mine work fine. There are all kinds of bytes in the boot sector which will theoretically tell the PC *exactly* how many bytes and sectors and tracks are on the disk and used for each part (number and size of FAT's, etc.). I think the BIOS on my PC may be a little smarter as well. I even had 800K (10 sector) disks work fine on my PC. If your disk driver isn't reading these bytes to determine how many sectors per FAT, don't blame Atari, blame the writer of your BIOS for not following their own rules and reading the number of sectors per FAT directly from the boot sector.

But while I am at it, does the BIOS now support any sector size other than 512 bytes? Any other cluster size besides 2 sectors/cluster? All the other stuff in the Bios Parameter Block and Boot sector that are supposed to set up all these values?

Your best bet is to pass control to the original keyboard handler first, after
which you can check the keyboard input buffer for the desired keys.
> ... I am also wondering whether it is safe
> to use system calls (like Bconout) in an interrupt routine.
No, not unless you expand the size of the BIOS stack (the pointer to which is
located at 0x4a2). If you replace this with a pointer to a suitably large
area of your own (say, 1 or 2K) then you can use BIOS and XBIOS calls. GEMDOS
is another story, and making GEMDOS calls from inside of an interrupt is
basically impossible (unless you want to rewrite the GEMDOS trap dispatcher).
> ... The second problem is with the desktop.inf reading. Right now,
> short of reading it myself, the only way I can do this is to rename a file to
> desktop.inf, and then reboot. Obviously this is a poor answer. Is it the
> only answer though?

> John Ogawa

No, it isn't the only answer. The best way to change the desktop.inf settings
is to tell the desktop to do it for you. That's what the control panel does.
There are 2 AES calls to do this; shel_put and shel_get. The syntaxes are
as follows:

shel_get(buf, n)
char *buf; int n;
Get n bytes of data from the desktop's current desktop.inf values, and put
them in memory starting at 'buf'. A value of n=128 gets the whole thing, I
think.

shel_put(buf, n)
char *buf; inf n;
Put n bytes of data, pointed to by 'buf', into the desktop's copy of
desktop.inf. A value of n=128 puts a whole new copy of desktop.inf in there.
When the user next selects 'Save Desktop' from appropriate menu, then this
information will be used to create (or re-create) the file desktop.inf on disk.

One last note; the control panel apparently only does one 'shel_get' (when it
is first loaded) and hence won't recognize changes made by other accessories
unless you save the desktop and reboot. I guess Atari or DRI didn't

expect anyone else to use these calls. They're also very poorly documented, at least in the stuff available to poor 'unregistered developer' slobs like myself! So I can make no guarantees about the above information, but it seems to work (a friend and I wrote a replacement VT52 emulator acc. and used these calls to communicate with the desktop).

G0 = LSB of green intensity

B2 = MSB of blue intensity
B0 = LSB of blue intensity

Intensity ranges from 0 (color not present) to 7 (highest
intensity).

Example: { red = 7, green = 3, blue = 5 } -> 0735 (hex)

Caveat: It is wise to mask off the upper four bits of each
palette entry, since a few programs store special
information there (most notably Art Studio).

The Formats

<NEOChrome>

1 long resolution (0 = low res, 1 = medium res, 2 = high res)
16 words palette
12 bytes filename (" . ")
1 byte Left color animation limit (starting color number)
1 byte Right color animation limit (ending color number)
1 byte color rotation speed
1 byte color rotation direction
1 word color rotation duration (number of iterations)
18 longs reserved for expansion
16000 words picture data (screen memory)

32128 bytes total

<NEOChrome Animation>

NOTE: To get this feature on versions 0.9 and later select the Grabber
icon and click the right mouse button in the eye of the second R in
the word GRABBER.

1 long magic number BABEEBEA (hex) (seems to be ignored)
1 word width of sprite in bytes (always divisible by 8)
1 word height of sprite in scan lines
1 word size of sprite in bytes + 10 (!)
1 word x coordinate of sprite (must be divisible by 16) - 1
1 word y coordinate of sprite - 1
1 word number of frames
1 word animation speed (larger means slower)
1 long reserved; should be zero
----
44 bytes total for header

? words sprite image data (words of screen memory) for each sprite,
in order

<DEGAS>

1 word resolution (0 = low res, 1 = medium res, 2 = high res)
Other bits may be used in the future; use a simple bit
test rather than checking for specific word values.
16 words palette
16000 words picture data (screen memory)

32034 bytes total

<DEGAS Elite (Uncompressed)>

1 word resolution (0 = low res, 1 = medium res, 2 = high res)
Other bits may be used in the future; use a simple bit
test rather than checking for specific word values.

16 words palette
16000 words picture data (screen memory)
4 words left color animtion limit table (starting color numbers)
4 words right color animation limit table (ending color numbers)
4 words animation channel direction flag (0 = left, 1 = off, 2 = right)
4 words animation channel delay in 1/60's of a second. [0 - 128]

32066 bytes total

<DEGAS Elite (Compressed)>

1 word resolution (same as Degas, but high order bit is set;
i.e., hex 8000 = low res, hex 8001 = medium res,
hex 8002 = high res). Other bits may be used in the
future; use a simple bit test rather than checking
for specific word values.
16 words palette
< 32000 bytes control bytes
4 words left color animtion limit table (starting color numbers)
4 words right color animation limit table (ending color numbers)
4 words animation channel direction flag (0 = left, 1 = off, 2 = right)
4 words animation channel delay in 1/60's of a second. [0 - 128]

< 32066 bytes total

Control byte meanings:

For a given control byte, x:

0 <= x <= 127 Use the next x + 1 bytes literally (no repetition)
-127 <= x <= -1 Use the next byte -x + 1 times
-128 No operation (ignore)

Compression Scheme:

Each scan line is compressed separately; i.e., all data for a given
scan line appears before any data for the next scan line. The scan lines
are specified from top to bottom (i.e., 0 is first). For each scan line,
all the data for a given bit plane appears before any data for the next
higher order bit plane.
To clarify: The first data in the file will be the data for the lowest
order bit plane of scan line zero, followed by the data for the next higher
order bit plane of scan line zero, etc., until all bit planes have been
specified for scan line zero. The next data in the file will be the data
for the lowest order bit plane of scan line one, followed by the data for
the next higher order bit plane of scan line one, etc., until all bit planes
have been specified for all scan lines.

<C.O.L.R. Object Editor Mural>

16000 words picture data (screen memory)
(palettes are stored in separate files)

32000 bytes total

<Tiny>

1 byte resolution (same as NEO, but +3 indicates rotation
information also follows)

If resolution > 2 {
1 byte left and right color animation limits. High 4 bits
hold left (start) limit; low 4 bits hold right (end)
limit
1 byte direction and speed of color animation (negative value
indicates left, positive indicates right, absolute value
is delay in 1/60's of a second.
1 word color rotation duration (number of iterations)
}

1 word number of control bytes
1 word number of data bytes
16 words palette
3-10667 bytes control bytes
2-32000 bytes data bytes

42-32044 bytes total

Control byte meanings:

For a given control byte, x:

x < 0 Absolute value specifies the number of unique words to
take from the data section (from 1 to 127)
x = 0 1 long is taken from the control section which specifies
the number of times to repeat the next data word (from
128 to 32767)
x = 1 1 word is taken from the control section which specifies
the number of unique words to be taken from the data
section (from 128 - 32767)
x > 1 Specifies the number of times to repeat the next word
taken from the data section (from 2 to 127)

<Spectrum 512 (Uncompressed)>

80 words first scan line of picture (unused) -- should be zeroes
15920 words picture data (screen memory) for scan lines 1 through 199
9552 words 3 palettes for each scan line (the top scan line is
not included because Spectrum 512 can't display it)

51104 bytes total

<Spectrum 512 (Compressed)>

1 word 5350 (hex) ("SP")
1 word 0 (reserved for future use)
1 long length of data bit map

1 long length of color bit map
<= 32092 bytes compressed data bit map
<= 17910 bytes compressed color bit map

< 50014 bytes total

Data compression:

Compression is via a modified run length encoding (RLE) scheme. The
data map is stored as a sequence of records. Each record consists of a
header byte followed by one or more data bytes. The meaning of the header
byte is as follows:

For a given header byte, x:

0 <= x < 127 Use the next x + 1 bytes literally (no repetition)
-128 <= x < 0 Use the next byte -x + 2 times

The data appears in the following order:

1. Picture data, bit plane 0, scan lines 1 - 199
2. Picture data, bit plane 1, scan lines 1 - 199
3. Picture data, bit plane 2, scan lines 1 - 199
4. Picture data, bit plane 3, scan lines 1 - 199

Decompression of data ends when 31840 data bytes have been used.

Color map compression:

Each 16-word palette is compressed separately. There are three
palettes for each scan line (597 total). The color map is stored as a
sequence of records. Each record starts with a 1-word bit vector which
specifies which of the 16 palette entries are included in the data
following the bit vector (1 = included, 0 = not included; i.e., stays
the same). The least significant bit of the bit vector refers to
palette entry zero, while the most significant bit refers to palette
entry 15. Bit 15 must be zero, since Spectrum 512 does not use palette
entry 15. Bit 0 should also be zero, since Spectrum 512 always makes the
background color black.
The words specifying the values for the palette entries indicated in
the bit vector follow the bit vector itself, in order (0 - 15).

<Animatic Film>

1 word number of frames
16 words palette
1 word speed (0 - 99; higher value is faster)
1 word direction (0 = forwards, 1 = backwards)
1 word end action (what to do after the last frame)
0 = pause, then repeat from beginning
1 = immediately repeat from beginning
2 = reverse
1 word width of film in pixels
1 word height of film in pixels

```
1 word version number (major)
1 word version number (minor)
1 long magic number 27182818 (hex)
3 longs reserved (should be all zeros)
--------
32 words total for header

? words image data (words of screen memory) for each frame, in order

<MacPaint>

header {
1 long version number (if zero, entire header is ignored)
38 * 2 longs pattern data (anyone know how to use this?)
51 longs reserved
}
< 51200 bytes compressed bitmap data
-------------
< 51716 bytes total

Bitmap compression:

The bitmap data is for a 576 pixel by 720 pixel image. The data is
stored as a sequence of records. Each record consists of a control
byte followed by one or more data bytes. The meaning of the control
byte is as follows:

For a given control byte, x:

0 < x < 127 Use the next x + 1 bytes literally (no repetition)
-128 <= x <= 0 Use the next byte -x + 1 times

There are 72 bytes per scan line. Each bit represents one pixel; 0 = white,
1 = black.

I have been sitting here listening with nothing to say for days then something pops up that I actually know something about! Magic!

Atari (Allen|Roy|Ken) said yonks ago that they had found and killed the bug that lost 2 clusters on a disk. But what if you put a the disk in a mchine with old ROMs? It can't read the last two clusters! So, sadly, the bug stays.

I would rather every bug was fixed and a ('a' means one :-) patch program to make them as bad as the old ROMs was issued. As time went by soon we'd all have new ROMs and the old software would be surpassed. Then we would just trash the patch.

>
I believe Allen is right on the line A stuff.
Main problem putting an 68020 into an ST is tough because of stack frame
differences. I caught this by setting a different vector base address,
and rework the frame to an 68000 one. All rte's are changed to traps
which recreate an 68020 frame, followed by rte.

Another problem is line-F.
Solution is easy:
There are only 16 or so line-A codes used, and 3/4 of the available
line-F codes. Just map (through a smart algorithm) all line F codes into
unused line A codes.
*** FLAME ON ***
Now this is what Atari should have done in the first place.
Line-F's are reserved and we all know for years why.
*** FLAME OFF
Luckily here's a fine chance to recover Allen: why not change this in
TOS 1.4. This will make life more some people a lot easier, and, since
people are already explicitly discouraged to call line-F directly, will
not break a substantial amount of existing code.

By the way: If you want to do the 68020 trick: there are also some timing
loops which have to get a new value (due to caching etc). Also some self
modifying code exists which needs a hack.

Also programs which do a move to/from SR will break since this
instruction became privileged. Just capture the exception and emulate
it.

I've hacked these things in the 11/20/85 disk TOS, and things seem to
work I get a desktop, but some programs still fail. Sometimes timing
loops seem to be the problem (as for AHDI).

Don't expect too much performance gain though, since you have to use the 16 bit ST bus and the 8 Mhz ST clock. Other problem is that your gain is often comsumed by extra wait states added by the glue? to accomodate for synchronisation between 68000 and video. The main gain is due to the cache.

Unrelated info:
Nice work Allen, what you are doing with TOS 1.4.
Keep things rolling. It seems that Atari is finally getting somewhere.
Makes me proud to be an ST owder again.

5314. Re: Bugs in new BETA ROMS?

Newsgroup: comp.sys.atari.st
Date: 1988-09-02 08:35:41 UTC
From: t68@nikhefh.hep.nl
Message-ID: <534@nikhefh.hep.nl>
Source record: 250864

All this bickering about bugs in the new ROMs and whether they are trivial to find giving all kinds of speculations about sloppy Atari proceedings sound ridiculous to me:

Theorem:
Taken by itself any bug is trivial, stupid and careless.

Theorem2:
Once you know about the bug it is very easy to locate it. This makes the author of the program look stupid.

Proof: There are probably exceptions to prove the rule.

I think Atari did finally the right thing. They made a new version of the operating system, incorporation lots of remarks and whishes. They give it an infinite amount more testtime than the original version. In addition they have for beta testers some people of whom they know that they are good programmers. Yet there will always be people who are not happy. TOO BAD.

Keep up the good work Allan.

5315. Pexec in accessories

Newsgroup: comp.sys.atari.st
Date: 1988-09-02 09:52:37 UTC
From: johan@sm.luth.se
Message-ID: <1200@luth.luth.se>
Source record: 250865

Hi there!

I'm new to the net as a contributor but I've been following this newsgroup with interest for the last two years.

My current ST project is a kind of CLI accessory wich would allow me to run non-GEM programs from within any GEM application. This requires calls to GEMDOS Pexec from the accessory, and here's where the trouble starts.

I've managed to make programs load and execute normally, but when they do, some of them seems to mess things up for the AES so that when my accessory closes and AES dispatches the main application, strange things start happening. Sometimes the application just hangs, other times the screen is filled with beautiful patterns. In one case I've been able to detect that control is not passed back to the main application but to the code immediately following the terminate trap in the newly executed program. Note that the Pexec call returns correctly and that these problems start later on when the accessory calls evnt_mesag. However, none of these peculiarities occur when I run programs compiled under MWC.

As I understand it, from the GEMDOS point of view, desk accessories are indistinguishable from the main application. A Pexec call from within an accessory should then perform exactly as if the main application had made the call, as long as the called program is non-GEM. The problems mentioned above seem to indicate that this assumption is wrong.

It may be that the source of these problems is to be found in the way my system is configured (Fatspeed, NeoDesk etc). But before I start dissecting my system it would be great to know whether pexecing from accessories is allowed at all.

I'd appreciate any comment on this.

Since can't run it I can't be of much immediate assistance. Does anyone here have suggestions? My guess is the MT C shell does command line arguments differently than gulam (the shell used by the guy who did the port). Perhaps it also does environment variables differently. (so the compiler merely can't find the library file as opposed to being unable to read it?)

>Is there software available for the st that will write ibm/pc compatible
>diskettes?

This is called GEMDOS and is located in the ST ROMs.

The builtin FORMATTER will format diskettes with a format, not known to
DOS 3.3 (or 3.2 or the like).
If you format the disk on the IBM and write to it on the ST, all will
work fine.

There rare some problems with the 40-cylinder (360k) disk drives
connected to the ST: the track-to-track time of these drives is about 6
msec, the ST assumes 3 msec. You can patch that wit ha simple POKE (or
the like).
Mabe Atari will make the system variables related to the external
hardware (like 5.25 inch disk drives) official?

From: Jim McCabe MCCABE at MTUS5
To: INFO-ATARI16 at SCORE.STANFORD.EDU
Subject: Tiny picture format

I've been writing a small graphics program lately that prints out ST pictures on a electrostatic plotter we have here in the MTU Graphics Lab, using David Baggett's spec-sheet as a guide. The Tiny description seems to be a little off, and I was wondering if anyone out there knows exactly what the format of a Tiny picture is. ~~~~~~~

Using Dave's sheet, the Tiny files I have keep giving me odd control_length and data_length values (such as zero :).

Can someone with Tiny experience describe the Tiny format for me?

>
> [miscellaneous comments deleted]
>
Atari/Sunnyvale has no direct responsibility for the "ABAQ" project, which is being handled directly by Atari UK.
47 units of Revision (aka Issue) 3 logic were built for Beta test, almost all of which remained in Europe. Production may go with these Revision 3 level units, or may wait for Revision 4, which includes higher integration of logic, revised packaging etc.
The Helios OS is being developed independently by Perihelion Software in UK, and is available from them, though I expect ultimately that it will be made available bundled with the hardware. I hear they have X-Windows ported to it, and applications are starting to come through (this was a primary intent of the Beta units, and hence the reason that the majority went into Europe, where Transputer experience is more widespread).

Sig Hartmann has responsibility for US coordination (408-745-2906), whereas the main contact at Atari UK is Les Player (011 44+753 33344)

So, it is alive and moving forward. It will not be taken to mass production until there is a reasonable amount of available software for it, including languages and development environments.

I think what Simon meant was that two of his partitions are either full or contain files larger than the free space on the partition. If your program works like I think it does, then this would cause it to fail. Otherwise, it sounds great.

Source record: 250872
Cross-posted to: comp.text,comp.sys.atari.st

The problem isn't lack of RAM, it's poorly allocated RAM. The 16K RAM they have they give entirely to the input buffer. There is no way to split this up between graphics and the input buffer. If they would give you 8K of grapics memory and 8K of input buffer, graphics prints would go twice as fast.

And that little RAM cartridge you can buy? All that RAM goes to downloaded fonts only. With that memory used for graphics, bit map dumps would go four times as fast.

If anyone is looking for the HP DeskJet SoftFonts information, I just finished moving and dug up that information, so send me your address and I'll send you a copy. There are some interesting limitations and some interesting power; for instance, you really print text at 600 dpi horizontally . . .

> up all these values?

Thank you for backing me up on the Media Descriptor versus the longhand
information in the boot sector.

We could have used the media descriptor byte F8, forcing the PC driver
to look at the boot-sector information, but those same dumb BIOSes
would make the faulty assumption that the media was nonremovable.
IBM realized the limitations of the media descriptor byte as shorthand
for the rest of the boot-sector information, and, at least in DOS 3.3,
they rescinded it. Perhaps they did sooner than that; I can't lay my
hands on a DOS 2.x tech ref manual.

A driver can be written to support >512 byte sectors, and I have been
told that GEMDOS will work, but you have to create GEMDOS buffers that
are appropriately sized. The built-in buffers are 512 bytes, and while
everything else is parameterized to the BPB, that size is fixed. If you
patch in your own buffers (using the system variable _bufl) it will
work, I have been told. I have not verified this. The person who told
me so had old ROMs, so that's even more encouraging. He said he wrote
a RAMdisk with an Rwabs that returned 1K sectors, and it worked fine.

Does anyone have any information on the hard disk interface?
I have the connector pinout, which has been published.
In the register description I have for the machine the only
mention of the hard disk interface is when talking about the
DMA chip, and then just to say that certain bits "select"
the hard disk.

I've heard rumours that the "hard disk" port is a
SCSI subset, so I'd like to write a general SCSI driver
for the port if I could figure out what the hardare does.

5326. Re: Bugs in new BETA ROMS?

Newsgroup: comp.sys.atari.st
Date: 1988-09-02 19:25:33 UTC
From: good@atari.UUCP
Message-ID: <1155@atari.UUCP>
Source record: 250876

Mr. Myron Drapal's comments regarding the Beta test of the new TOS have ceased to be speculative, and by his own admission derived from hearsay, and have now become facetious.

His article <3446@druhi.ATT.COM> includes:
"the level of developer testing was probably done by the compiler ("It compiles, let's ship it..."
"there may be *NO* official beta testers out there..."

If Mr. Drapal had taken the time to read my posting <1150@atari.UUCP> of 9/01, he would have seen that we have around 70 "official" Beta sites. Had he also taken the time to read Allan Pratt's posting <1152@atari.UUCP>, he would further have seen a detailed explanation behind this one topic that is so very dear to Mr. Drapal, that of compatibility with IBM-PC formatted media.
But it seems that Mr. Drapal has not the time to do this (unless the posting take a long time to reach his site), and prefers to continue his speculative and demotivating tirades.
In my posting, referred to above, I asked Mr. Drapal to publicly post his sources for these reports etc. I will assume that he will respond over the weekend and once and for all reveal these secrets.

I believe that the vast majority of readers of this topic are reasonably mature people, since they are in the UNIXtm world [:-)], and therefore can derive from these types of posting the character of the poster. With that remark, I feel I have no need to state my own feelings.

As an aside, Mr. Drapal is using the resources of AT&T to cause what is potentially commercial damage to Atari Corporation. Additionally, Atari is a customer of AT&T. I would be interested to know what AT&T Management feels about this type of business relationship. Maybe the System Administrator of this AT&T site would like to obtain a response from the appropriate divisional management, and also comment on whether AT&T condones this type of posting through its corporate systems. Since Mr. Drapal does not include any disclaimer to the contrary in his postings, and since he signs his postings as "AT&T Bell Laboratories, Denver", I (and any other reader) have no reason to believe other than that his comments reflect the opinions of AT&T.

An alternative, parallel, approach which I might suggest is that any reader who is against this type of posting "email" his/her opinion to Mr. Drapal, and to any other poster who adopts this approach, in this or any other news category.

I plan no further postings on this topic, as I believe all has already been said.

Roy J. Good
Product Development, Atari Corporation

Views expressed are my own. Atari may agree or disagree; they have the right.

5327. Object formats

Newsgroup: comp.sys.atari.st
Date: 1988-09-02 20:14:49 UTC
From: leo@philmds.UUCP
Message-ID: <789@philmds.UUCP>
Source record: 250877

Hi folks!
I'd like to extend my disassembler (one of my 'current programming projects' 8-) with an option to disassemble object files (you know, those files left by your compiler to be linked into an executable program).

What I would like to know:
a) How many different formats do exist? The ones I know of are TOS format (extension .o) and GST format (extension .bin). Are there any (many ?) others?
b) What do these formats look like? I've been fiddling with dumps of GST objects and I can recognize certain patterns, but this seems a hard way to go. Any official documentation? (must be, since for instance Lattice uses a GST linker for their objects).
c) Libraries: for the GST linker a library is just a file that is a concatenation of object files; does anyone know of more clever linkers (those that can handle random access libraries)? I think the speed of the GST linker leaves to be desired (perhaps I should wait for the GNU stuff?).

E-mail preferably; I'll summarize. But if you think you're a guru on this topic, feel free to teach us poor earthly creatures 8-).

Leo.

5328. Where have all the digests gone ... ?

I wonder where the following Info-Atari16 digests went:

#338 #349 #350 #352 #353 #354 #355

Did they ever exist ? Were they munched during ARPA --> Bitnet transfer ?
Have I missed anything important ? ;-)

Also, why do old messages keep sneaking into new digests ? Just curious.

From: VBRANDT@DBNUAMA1.BITNET
Message-ID: <8809022127.AA12529@ucbvax.Berkeley.EDU>
Source record: 250879

Hello all,

... while rereading the last few digests I came across the discussion on program loading and relocating. Please tell me if I understood correctly:

When I have a program that does not use absolute addresses (ie. the relocate flag in the program header is turned off), the following things happen:

- The program file is left open, the handle is 'used up'.
- The BSS is not cleared (what could there be in it?)

Do these problem remain in the current 'blitter' TOS ? What side effects do they have (aside from GEMDOS possibly running out of file handles or the BSS containing garbage) ?

I'm interested in this since I usually take care to keep all my assembler programs position-independent.

Any and all info is welcome.

Wow, So Have I.

Atari, I have been trying to contact your representive
on Genie, Cindy Clavehorn I think is her name, but she claims she has
no record of my developer status!

What you say, complaining in public? I have for about
two weeks been trying to get her to add me to the developer sig on genie,
but she won't do it. I have been waiting about a week to get a message
back from her. What do I have to do? I AM a registered developer.
By the way, my name on genie is n.kline.

Please respond Atari.

We use ST 1040s (and other computers) in our Institute for educational
purposes. We give classes for our students and provide an opportunity
to practise using computers. We have found many of the programs on
PD languages, gulam, uniterm (the students have access to 3 UNIX boxes.).
I think one can say that the program collection IS useful from an academic
point of view, and I suggest that the collection is taken over to
the LISTSERV. This would have the additional advantage that it would
then become also a mail based server and thus accessible from other networks
than Bithan BitNet.

Steve Grimm has the whole executable now. Unfortunately, he has to test it, and having been victimized by this game myself, I'm afraid that may mean the end of the sources and binaries newsgroups. Some of you may be interested in a couple of bugs I found in Mark Williams C 3.0.6 (and promptly reported, so they should be fixed in the next release). Consider:

```
foo(junk)
char junk;
{bar(&junk);}
```

junk, assuming the caller of foo knows it as a char also, is pushed on the stack as an int. &junk turns out to be a pointer to the extra char which pads out junk to int length. I dislike this programming practice anyway, so the useless interpretation is no biggie. Next:

```
foo(junk)
register long junk;
{return junk & 0x01000000L;}
```

The mask operation is quite reasonably compiled as a bit test instruction, but for a long mask with the active bit in the high order half, the wrong bit is tested. Better practice than the first one, but still pretty obscure.

Finally, a legal opinion worth the paper that it is printed on...

> But you do not get any goodwill by flaming us in
> public about UNRELEASED products. ^^^^^^^^

Good will starts at home, and I think that your company needs to start
treating its registered developers (and customers) better if it expects
to be on the receiving end of some good will. In my final commentary
regarding this on NETNEWS, I suggest that the following issues need to
be solved to help this along:

1. NETNEWS was the accepted forum for bug reporting, especially when
Landon and Alex were employed at Atari.

In fact, discussions usually included the report of the
bug, followed by discussions from developers and the Atari
folks regarding how the bug was noticed (reproducibility)
and even possible solutions, both long term and short term.
In particular, the 40 folder bug was solved this way.

2. Most registered developers have not been receiving updated documents
or information regarding new bug report procedures.

I have been a registered Atari ST devloper for over two
years. I have yet to receive any update notices, new
documentation (the GDOS documents that some registered
developers got a few months back), nor was I notified
that the new TOS 1.4 was being made availble to BETA sites.
I know this isn't your fault (Allan and Roy), but you are
the only people from Atari on the NET that seem to listen.
Where is the support?

I realize that $300 is not much if you consider the entire
development cost of the ST. It is, however, a significant
investment to those of us who don't have money to burn. I,
for one, feel that the quality of the documentation in the
developer package was at best mediocre, and we developers
are entitled to updates in a reasonable amount of time.
Promises were made to these few who forked over the $300
that updates would be made available, but I have not seen
any to date. I am not alone in this feeling, either. A
number of very good third party developers have left your
fold, primarily due to very poor support on Atari's part.

3. Instructions for reporting bugs should be made available to all
owners - not just a few "selected" registered developers.

Even a person who owns an ST and only runs 1st Word should
be able to report a problem to you. They may be using the
system in a way that none of us could possibly dream of.
If there had been such an approved method of reporting bugs
and it had been distributed to all owners (simply through
Compuserve, NETNEWS, etc.), this whole issue would not have
happened at all.

>
> Please cut it out.

If you really don't want the feedback, please create a new newsgroup
(I suggest mod.sys.atari.st), designate yourself as moderator, and
screen the postings as you see fit.

But, if you really do want the feedback (as you claim above), please
make the reporting mechanism and the instructions available to all
ST owners. We're all in this together - I think most of us are
willing to help, given the proper information and consideration.

>
> I post this in public because the offense was committed in public. I am
> also sending mail, because that is far less likely to be overlooked by
> the intended recipient.

Ditto.

I'm afraid that the only offense that I'm guilty of is telling the truth
in a public forum. For that, I plead guilty.

5334. Beta Test ROMs

Newsgroup: comp.sys.atari.st
Date: 1988-09-03 19:52:13 UTC
From: Gribnif@UMass.BITNET
Message-ID: <880903154746F7F.ANTU@Mars.UCC.UMass.EDU>
Source record: 250884

Greetings!

Given the latest discussion of the Beta ROMS (which, I have yet to see <grrr...>) I came across a few letters I simply *had* to comment on:

att!mtuxo!mtgzz!drutx!druhi!med@ucbvax.Berkeley.EDU (Myron Drapal) writes:
> I tend to create a number of windows in my desktop.inf
> file in which I change the pattern (via an editor) from the standard
> *.* pattern to a known pattern (i.e. for Micro C shell - gemcsh.prg).
> This then brings up a window at boot time that has only this entry in
> it, so I can quickly start Micro C shell, or Magic Sac, or...
>
> Well, on the new BETA ROMS, the window comes up at usual, but
> you *cannot open* the ICON (e.g. it won't execute)! You can select it
> (in fact, many times), but it will not execute. In fact, after some
> number of clicks, you get 2 bombs and the system reboots.

I certainly hope this is not true, or if it is it gets fixed. But then this would be no more strange than the desktop crashing horribly when you try to create too many icons (I know the 11/85 ROMs do).

There was also considerable mention of having the desktop on disk, rather than in ROM. Having written NeoDesk, an alternative for Atari's desktop, I would be lying if I said I did not enthusiastically support this idea. I am sure, however, that the reason this has never been done is because the code for the AES and the desktop very intermingled and picking them apart is not something that anyone looks forward to. Someone also suggested moving DESKTOP.RSC to disk, and there should be no reason why this cannot be done.

Atari seems to be doing a good job of fixing problems and making improvements with this new release of the ROMs. The rumor is, however, that this release will be the last release for ST ROMs. And, given the lack of availabily of the "intermediate" (blitter) ROMs, I tend to believe it.

It is hard to say this without sounding like a blatant advertisement for my product, but wouldn't you rather be running a desktop you know will work as you want it to and, if it does not, it can be fixed without having to wait for entirely new ROMs? The current version of NeoDesk contains one fatal bug (that is really quite rare) and a few minor ones, all of which we *INFORM* you of on a readme file on the disk! Not only have all of these been fixed for Version 2.0 (which will be available soon), but the new version has numerous other changes that make it a godsend not only for the normal user, but also for developers.

I am not really trying to flame Atari (they get enough of that from everyone else) but I would like to remind everyone of their track record. From Day 1

there has been a distinct lack of communication between them and users. By users I don't mean just people who have access to E-mail systems, I also mean the average Joe who buys a 520 and wouldn't know a modem if he saw one. Allan Pratt and others from Atari have been very helpful to us here, but what about the guy who finally gets his new 11/88 (or whatever) ROMs installed and then tries something like the above, only to have the desktop crash? Do you think he should wait until, perhaps, some friend of his who has access to Info-Atari16 tells him that that is a well-known bug (like Malloc() is now) and that it's just something to be avoided? I sent-out my warranty card the day I bought my 1040 and how much info do you think I have gotten back from Atari about anything? Not even so much as an advertisement.

All I can say is that I sincerely hope that Atari intends to inform EVERYONE by REAL, honest ta' goodness SNAIL MAIL that the new ROMs are available, that they provide everyone with a way of reporting bugs, and that they continue to upgrade the ROMs, not let whatever bugs are bound to exist (no software is perfect) in them to fester indefinitely.

In the meantime, buy NeoDesk. You'll like it. <grin>

From: rob@kaa.eng.ohio-state.edu (Rob Carriere)
Path: kaa.eng.ohio-state.edu!rob

In the last couple of weeks, this newsgroup has seen various people comment about the ``calm'' approach Atari representatives have to (perceived or real) flames. It would seem though, that this is the calmth of a steamroller or some similar ``impressive'' device. Casu quo: there is a person, Mr. Drapal, who has posted what he clearly believed to be some bugs in the new beta-test ROMs. Atari's response so far has been to spew out large amounts of lawyer-speak giving the impression (which may or may not be correct, that's what impressions are all about) that they aren't at all interested in dealing with the facts (or possibly lack thereof) Mr. Drapal is bringing up, but instead want to silence him as fast as possible, and, as indicated in the posting this posting refers to, in the worst possible way. This behaviour on the part of the Atari representatives has already prompted one reader to post that he cannot help but believe that where two parties are creating so much smoke, there's got to be a fire.

I do not want to make or imply a statement of condonement or condemnation of Mr. Drapal's methods and style of communication; I can envision scenarios in which he would be perfectly justified doing what he is doing, and I can see circumstances under which his actions would be very unethical. Since I do not know the background, I will not make judgements. However, ethical or not, Mr. Drapal's communications allege bugs in both the beta-ROMs and in Atari's development methods. Further, at least one reader of this newsgroup seems to be of the opinion that Mr. Drapal knows enough about these things to be worth listening to. Yet, Atari representatives seem unwilling to do much more than publish statements synonimous to ``Of course this is all unfounded.'' I find this very disturbing.

I know it is very difficult to remain calm when someone is shouting in your face (and I won't claim to always, or even most of the time, be able to do that), but when you are the company mouthpiece (no slur intended, quite the contrary) you have to try and do that, or your customers will get restless. It may be that all the problems Mr.

Drapal mentions and insinuates are figments of his imagination, or irrelevant for other reasons, but we (your customers) do not and cannot know that. Please take our peace of mind into account when you compose your future postings. Thank you very much.

Rob Carriere
The above are my opinions and feelings on the matter discussed, they should not in any way be attributed to or associated with, The Ohio State University, its College of Engineering or the Department of Electrical Engineering.

5337. Re: ANIMATION QUESTION

Newsgroup: comp.sys.atari.st
Date: 1988-09-04 06:52:54 UTC
From: leo@philmds.UUCP
Message-ID: <790@philmds.UUCP>
Source record: 250887

In article <880831-204234-3799@Xerox> "Robert_L._White.ESXC15"@XEROX.COM writes:
[some lines deleted]...
|The way I am doing my animation is this. I am using 3 screens. One holds the
|background picture, one is the drawing screen (LOG BASE), and one is the
|screen being viewed (PHYS BASE).
|For 1 animation sequence I copy the background screen to the LOG BASE
|screen, then draw my sprite to the LOG BASE screen, Then do a
|SETSCREEN to swap the PHYS BASE screen with the LOG BASE screen.
|Thus the old PHYS BASE screen becomes the new LOG BASE screen and the old LOG
|BASE screen becomes the new PHYS BASE screen.
|This is then repeated every vertical blank, and every thing works great,
|with no flicker (at 1 pixel per Vertical blank).

How do you know it is repeated every vbl? Do you use a vbl routine to achieve
this?
I've got a copy of the book '3D Grafik Programmierung' from Data Becker.
It suggests that SETSCREEN swaps at vbl time. ***THIS IS NOT TRUE!!!***
(maybe you got the same impression). SETSCREEN does not wait for vbl
to set the screen(s); only if you also change the resolution it will wait
for vbl.
There's another 'know-it' about vbl:
You *CAN* set the screen at vbl time; this however sets logical and
physical screen to the same value (not suitable for your application).
The way to do this is: enter the new screen base into the system
variable screenpt ($45e). At vbl time the screens will be set then (I
think you have to refill it with 0 to avoid having it set all the
time).

|I am writing my code in 'C' and assembly. The background screen copy
|routine is in assembly (for speed), and the rest is in 'C'. I am pretty sure I
|am doing all my animation before the Vertical blank, and am executing the
|SETSCREEN command every vertical blank, (60 setscreens per second).
|I have verified this because I seem to be able to move 60 pixels per second.
|If anyone can give me some tips on how to move a sprite faster, it would
|be appreciated.
|Thanks,
|Robert L. White, Xerox Corp.

The jerkyness could possibly be caused by the copying of a background screen.
This seems quite a time-comsuming operation. I don't see the use of it.
I thought for a sprite you'd only have to save the screen contents it is
going to occupy, so that when it moves you can restore this little piece,
then redraw the sprite. But I'm not an expert on sprites...

Leo.

:: > > At least not in the BETA ROMS...
:: >
:: > PLEASE DO NOT USE NEWS TO REPORT BUGS IN UNRELEASED ATARI PRODUCTS.
:: >
:: > Am I making myself clear?

:: 1. NETNEWS was the accepted forum for bug reporting, especially when
:: Landon and Alex were employed at Atari.
::
:: In fact, discussions usually included the report of the
:: bug, followed by discussions from developers and the Atari
:: folks regarding how the bug was noticed (reproducibility)
:: and even possible solutions, both long term and short term.
:: In particular, the 40 folder bug was solved this way.

I might add, that a forum like Netnews is rather less useful if it can be used
only to say nice things about Atari.

:: 2. Most registered developers have not been receiving updated documents
:: or information regarding new bug report procedures.

:: I have been a registered Atari ST devloper for over two
:: years. I have yet to receive any update notices, new
:: documentation (the GDOS documents that some registered
:: developers got a few months back), nor was I notified
:: that the new TOS 1.4 was being made availble to BETA sites.
:: I know this isn't your fault (Allan and Roy), but you are
:: the only people from Atari on the NET that seem to listen.
:: Where is the support?

:: I realize that $300 is not much if you consider the entire
:: development cost of the ST. It is, however, a significant
:: investment to those of us who don't have money to burn. . .

Again, I might add that I have been a registered developer since before
the Atari ST's were publicly available (one of the THREE THOUSAND DOLLAR
registered developers), and I have not received any information directly
from Atari EVER, AT ALL. What little information I get that is not
broadcast by non-Atari personnel to the net, etc., comes from the Atari
developer's forum (where they did at least consider me enough of a developer
to unlock the registered sub-forum). Is everything lost in the mail?

:: 3. Instructions for reporting bugs should be made available to all
:: owners - not just a few "selected" registered developers.

:: Even a person who owns an ST and only runs 1st Word should
:: be able to report a problem to you. They may be using the
:: system in a way that none of us could possibly dream of.
:: If there had been such an approved method of reporting bugs
:: and it had been distributed to all owners (simply through
:: Compuserve, NETNEWS, etc.), this whole issue would not have
:: happened at all.

Here all I can say is, "Yes, we should have a way other than flames on the
net to pass information around." Specifically, Atari should do something
(since I have seen nothing official or unofficial that would summarize what
problems Atari is aware of, or working on, or doesn't care one way or the other
about) to inform registered developers, unregistered developers, former
customers, et al., about what bugs are present in the ROMs, which are being
fixed and which are to become "features".

And I suspect if such a list were made public, many other bugs would be
made known simply because the ones who have uncovered them have assumed
the bugs to be common knowledge, unrepairable, uninteresting or whatever.

Whether true or not, Atari appears to have very little interest in me, and
I am reciprocating. Being very stubborn, I still have several thousand dollars
worth of Atari gear, and I occasionally work on an Atari project. But I have
not reccommended an Atari ST for any reason for a long time.

5339. Atari Fair in Duesseldorf this Weekend

Newsgroup: comp.sys.atari.st
Date: 1988-09-04 21:10:16 UTC
From: atoenne@laura.UUCP
Message-ID: <580@laura.UUCP>
Source record: 250889

Hi Atari Fans (Haters ?)

as an employee of an exhibitor for Smalltalk80 on MegaST (great stuff anyway)
I visited the German Atari fair in Duesseldorf today.
Among lots of *very* boring software and demos I found the following...

TOS 1.4 alife and kicking (actually on the machine next to me).
It's fast and shows a good feeling for hard disks (though i discovered a bug
in the first ten minutes. But hey! who expects a beta version to be bug free?)
I was told that the main schedule for the ROMs is end of november.

A 1280@960 points screen compatible to most Atari products (including our
Smalltalk80) for about 5000 DM (thats 2500-3000$). Lots of $$ but a
nice and high quality product.

The legendary Atari CD ROM!!!
It's real.

The Atari transputer machine (just another demo, but the machine works still :-)

Lots of rumours about the TT. Seems Atari is really working on it.

>beter print quality than the LaserJet fonts would.

Then why not fix the Laser Jet to use the same compaction and make the
font cartridges cost 1/3 as much for it too? (I wonder why we
never bought a font cartridge for our LaserJet, other than getting
TeX working first?)

In article <561@accelerator.eng.ohio-state.edu> (news) writes:
[a whole lotta talk about Mr. Drapal making a ''harmless'' statement about a bug in the new beta roms, and how atari has ''spewed out large amounts of lawyer-speak'' to try and ''silence him as fast as possible, and in the worst possible way'']
>
>I do not want to make or imply a statement of condonement or
>condemnation of Mr. Drapal's methods and style of communication; I can
>envision scenarios in which he would be perfectly justified doing what
>he is doing, and I can see circumstances under which his actions would
>be very unethical.

After heading what Atari and Simon Poole had to say, I don't see any way in which Mr. Drapal could be justified doing what he is doing. Either he has an illeagal copy of the ROMs (or the disk based version), or he breached his contract (or at least his promise) with Atari about not talking publicly about bugs in the beta roms. Either way that was not at all ethical.

>Since I do not know the background, I will not
>make judgements.

well it's a little late for that. I'd say that you're first eight or ten sentences sounded pretty judgemental to me.

>However, ethical or not, Mr. Drapal's communications
>allege bugs in both the beta-ROMs and in Atari's development methods.

You're absolutely right, and it was none of Mr. Drapal's business to do so. As others have said, one of the main purposes of the beta test is to determine what bugs have not been found at implementation time. I believe that Atari is perfectly justified in keeping their PRE-RELEASE bugs to themselves if they want to, especially when their current reputation in that respect is not at it's best. Whether Mr. Drapal stole the beta roms, or simply broke his promise with Atari doesn't matter. What does matter is that Mr. Drapal deliberately damaged Atari's reputation, however tarnished it might already be, and you seem to be in support of that.

>... Yet, Atari representatives seem unwilling to do much
>more than publish statements synonimous to ``Of course this is all
>unfounded.'' I find this very disturbing.

Atari representatives responded by stating that the bugs Mr. Drapal talked about will be fixed in the release version (in other words, the new roms will read IBM disks).

>I know it is very difficult to remain calm when someone is shouting in
>your face (and I won't claim to always, or even most of the time, be
>able to do that), but when you are the company mouthpiece (no slur
>intended, quite the contrary) you have to try and do that, or your
>customers will get restless. ...

I think that Atari's response to Mr. Drapal's nonsense was written in a
sufficently calm style.

>regarding this on NETNEWS...

Thank goodness. It was sure getting tiring reading all this drivel
about what you consider to be proper beta testing methodology. If this
hasn't scared Atari off of doing Beta testing in the future, then
nothing will. I know for a fact that if I were in the final stages
of a products' development, gave a preliminary version of the
program to a few trusted friends to check out, and subsequently found
out that someone else had obtained a copy and was not only badmouthing
the preliminary version, but also my company, on a worldwide network,
then rest assured I would be pissed as hell as well.

/* FLAME ON...my first flame ever :-) */
Why don't you go buy one of those fire-sale 3B1's. That should keep
you busy complaining for a year or two. The rest of us will just
fumble our way along developing and learning. Guess we don't know any
better.

5344. Re: GEMDOS bug running fully relocatable programs ?

Newsgroup: comp.sys.atari.st
Date: 1988-09-05 09:07:15 UTC
From: t68@nikhefh.hep.nl
Message-ID: <536@nikhefh.hep.nl>
Source record: 250894

What you have been doing is setting the 'no-relocation' word in the program
header (bytes 26 and 27 in the program file).
When this word is nonzero closing the file and clearing the bss are skipped.
The old program relmod.ttp (or relmod.prg) messed things up, because it
didn't recognize fully relocatable programs. The first entry in the relocation
table should be a long and if there is no more relocation the relocator
expects a zero (byte). Your problem is solved if you zero the relocation
word in the job header and make sure that the relocation table at the end
of your program is a long zero.
As far as I understand from earlier postings of Allan Pratt he has fixed things.
He mentioned the problem specifically.

By the way: it is not only relmod that made this mistake, there are other, even
brand new programs that have the same mistake. So it seems to me that the most
intelligent response of the loader to a relocation table with only one byte
would be to skip relocation if this byte is zero, but don't give an error
message.

There is a Pascal compiler (Kettler TeX was done with it) that even forgets the
zero at the end of the relocation table. Amazingly enough the loader doesn't
crash on it, it thinks that everything is fine. I guess that Allan Pratt knows
about this though.

5345. Re:Re: ibm pc disk (LOTS OF DETAIL by Allan Pratt)

Newsgroup: comp.sys.atari.st
Date: 1988-09-05 10:34:00 UTC
From: U0179@DGOGWDG5.BITNET
Message-ID: <8809051032.AA07013@ucbvax.Berkeley.EDU>
Source record: 250895

Attn.: Allan Pratt

In one of your mails in the INFO-ATARI16 Digest Volume 88 Issue 376
(ibm pc disk (LOTS OF DETAIL)) you told us some facts about new disk
formatting and media change.

Sorry about the following, but as one of the BETA TOS tester here in
Germany I have to tell you some bugs within the new TOS v1.4 beta
release (some days ago i was confined by my professional discretion) :

1) the IBM PC don't like a disk formatted with the new TOS release ...
(using standard DESKTOP formatting capability)

2) it seems that pressing ESC didn't flush all buffers (FAT cache ??) ...
try the following with two ST's :
a) insert a disk into the first ST (standard DESKTOP formatted)
b) open a window under DESKTOP
c) execute any program, finish the prgm, return to the DESKTOP
d) remove this disk and insert it into the second ST
e) overwrite the program you have executed on the first ST
(eg. copy a new (size different) version of the program onto
this disk)
f) insert this disk into the first ST, hit ESC and execute the
program again
g) --> you will get a TOS error !!

I hope, that some other (minor) odds within the new TOS release covered
by BETA testers are already known to you.

Let me say here thanks for your work on the new TOS release. You have
really corrected the most crucial bugs (40 folder, malloc, IO redirection,
disk performance). This kind of upgrading is the way to become a Operating
System wich we (the ungrateful (?!) ATARI users) can live with.

Please, keep going on this way in the future ...

Best regards

W.Huebner

Source record: 250896

To the intersection of netlanders & Atari users and APL users (assuming it is not empty!)

I have decided to put this request on the nets, because all other resorces have given no result.
I am connected to an IBM mainframe (3081) via a 7171 serial terminal controller. I use as a terminal program the UniTerm version 2.0d (thank you, Simon!) which has a lot of amusing features excluded the one I need most, that is APL characters support. I don't know of any terminal emulator for the Atari ST which supports this feature. Is there anyone in the net who knows something about that? Or a kind soul which has written it and wishes to put it in the public domain of APLlers? Or a professional programmer who writes it and sells it at a resonable cost? Since I think that this request is not of general interest, please e-mail me (the address at the end). Thank you!!!

5348. Deskjet

Newsgroup: comp.sys.atari.st
Date: 1988-09-05 17:56:31 UTC
From: HEIMBIG@WSUVM1.BITNET
Message-ID: <8809051756.AA11462@ucbvax.Berkeley.EDU>
Source record: 250898

I have a Deskjet and Mega-2, for text output the speed is as reported
about 2 to 4 pages per minute, quality is great. Using Logistix spreadsheet
(laserjet driver) a graph took about 15 minutes and was distorted
but i have no idea whether this has the deskjet fault or Logistix fault.
I use the Deskjet at work frequently with PC and pc graphics programs
and use laserjet as the driver and so far everything has worked fine.

I just order Supercharged Easy-Draw from Migraph, and a Deskjet specific
driver (they have laserjet drivers too). Since this is a GDOS driver it
should work with other GDOS program (ie timeworks PP, wordup).
The Migraph salesman said a single copy of a one page graphic often
is faster with the Deskjet/ DJ driver than Laserjet/ Laserjet driver.
I'll post to net how the new driver works when it comes in.

By the way it's true a Mac SE and laserwriter with any of the
publishing/drawing programs takes about 30 (sometime 1 hour) minutes
per page. The main time consuming factor is down loading fonts over
appletalk. Apple has 'solved' this problem with a new laser printer
that keeps all the fonts you could want on a hard disc in the printer.
If you have about $30,000 (??) you can buy one of these yourself.

I have a question for Dave Neff (or others):
After buying my DeskJet I received a publication from HP claiming not only
deskjet drivers for the ST but also PaintJet drivers. Dave are these
GDOS drivers or something else. Does anyone have a PaintJet printer
in use with an ST? The PaintJet 150*150 resolution with color output
could also be a really hot combo with the ST.
Any comment?

Bye

Now - this is what prompted me to reply. This is hitting below the belt.
If Atari is going to use their "corporate weight" (hah!) to censor the net
then I move that Atari be banned from the net.
This is a non-commercial service to provide INFORMATION. If company A says
company B's product is bad and has proof of it, readers of the net should
know. If you try to imply that AT&T is trying to badmouth Atari and that
will hurt sales just because an Atari user who happens to be an employee of
AT&T found some bugs in your code then you are a very stupid and ignorant
person.
Again - is this the public image Atari wants to project?
(Please don't contact UofT - yes they buy your machines and some develop code
for it. I doubt they will care if my opinions hurt your feelings. I pay
cash for my account.)

Source record: 250901

If everybody calmed down and stopped letting emotions get in the way things would go a lot smoother. For example if you've paid attention to the series of postings before this one, that of the three "bugs" reported by Myron, two have apparently already been fixed, and the other (pc-compatible formatting) is not a bug in the ST system, but instead is a problem with the PC-compatible Myron used (presumably it had MS-DOS 1.x BIOS rom's). By the way, I have read the MS-DOS 2.x technical reference manual, and it does explicitly state that as of version 2.0 drivers should stop depending on media bytes and should instead look at the bpb; thus I agree with Allan Pratt's analysis.

Also, if you've had problems getting registered developer mailings, I would
write a letter to Cindy (not a phone call)

make sure that the necessary non-disclosure forms were
properly signed and sent in

make sure that you've responded to any previous requests from
Atari for status information

(things don't always go wrong; I have gotten all Atari developer mailings without having to goto any special effort).

OK., I'll give you a scenario (and *again* I'm not claiming that this
or anything similar actually happened). What if Mr. Drapal *had*
tried the official channels and found them unresponsive? Judging by
some of the comments of registered developers, that's not unthinkable.
I don't know what the law says in such cases, but I wouldn't have any
ethical problems.

>>Since I do not know the background, I will not

They may have, but they weren't intended to. At least they were not
intended to convey anything beyond my feeling disturbed at the
way Atari chose to *appear* to look. The whole purpose of the posting
was pretty much summed up by the summary line: don't fasten your
shoelaces while walking among your neighbours watermelons.

That unfortunately is *not* what they said (or I'd have been quite
happy). They said the new ROMs will be able to talk to PC-DOS 3.x,
may be able to talk to PC-DOS 2.x (apparently that wasn't even worth
fishing up a manual, according to Atari's response, -- I assume then
-- let alone worth testing), and will certainly *not* be able to talk
to PC-DOS 1.x. I can sure live with the last clause, but the first
two do not compatibility make, at least not in my book.

In case you are confused by the multitude of postings, please check back and see that the issue was not so much being able to read and write, but being able to format, and Atari wasn't guaranteeing anything beyond being able to format so that a true-blue PC running 3.x could use it.

If the 128k Magic Sac come out, will it also be able to take advantage of the Apple Talk networks? I know that there is an Apple Talk card for the IBM and being able to use the Apple Talk net would be nice for both businesses and colleges.

Any word on this?

> "If it works like I think it does..."
It doesn't. It can handle anything but nearly completely full disks (I set a limit of 8K free space minimum when it will inform you that it can't optimize). I had no trouble with a 2.5 MEGABYTE file with only 250K left on the partition. It also rearranges the directories and sets up files for PC Ditto bootability (without using the MS-DOS format command).
Hard Disk Sentry was designed to handle nearly everything, and on the things it couldn't, to not lose any data. Large files aren't a problem. Even fairly full partitions aren't, as long as there is some free space (and moving one file is usually enough to create adequate space). It isn't blindingly fast, especially with little freespace to play with (since it is copying every byte on the hard disk twice, and adjusting directories and FAT's as it goes - a *lot* of thrashing), but that is because I chose safety and functionality over speed.

I've never tried it myself, but it should work, when you build
Routine B like:

...
olddta=Dgetdta();
Dsetdta(newdta);
.
Fsfirst(...);
Fsnext();
.
Dsetdta(olddta);
return;

(I'm not sure I've used the correct names, but you'll know what I mean.)

5357. News from the Atari fair at Duesseldorf, West Germany

Newsgroup: comp.sys.atari.st
Date: 1988-09-06 10:59:57 UTC
From: VBRANDT@DBNUAMA1.BITNET
Message-ID: <8809061059.AA22448@ucbvax.Berkeley.EDU>
Source record: 250907

There was an Atari fair in Duesseldorf, West Germany. I was there last friday, and here are some things I heard there:

- TOS 1.4 will be released in Germany in November and cost about DM 100.-. You will get: 6 ROMs and a disk with new support software. (Source: an Atari Germany representative)

- Turbo C was sold at the Borland/Heimsoeth booth at a 'special discount': 150 DM w/o, 230 w/assembler & debugger. They are working on 68881 support but couldn't tell me when it would me available and how much it would cost (which is what stopped me from buying it, since I have the 68881 in my Mega). They must have sold hundreds of copies, though.

- Atari will market the MadMac/ALN package separately, but not before 1989.

- There was a Yugoslavian company displaying a hard/software package for STs and PCs to emulate IBM 3277 terminals directly. I can post details if there is sufficient interest.

5358. HARD DISK: HELP OFFERED AND WANTED

Newsgroup: comp.sys.atari.st
Date: 1988-09-06 11:36:52 UTC
From: remco@tnoibbc.UUCP
Message-ID: <821@tnoibbc.UUCP>
Source record: 250908

Hello ATARI-lovers: I can help you and meybe you can help me
- THIS IS NOT A COMMERCIAL -

I connected a CMI 5619 harddisk (16MB) to my 1040ST via a XEBEC S1410
controller and an ATARI host adapter board. The software I used
is: icdfmt.prg from ICD (a *VERY* nice program which may be distributed
freely) and icdboot.prg as a diskdriver.

The problem is: when I try to format a second hard disk (logical unit
number = 1 instead of 0, which is the first HD), the disk starts
formatting but when the last track is done, the formatting process
starts all over again, so partitioning is not done.
I *can* format the second disk when I strap it to be LUN=0, but I
still cannot access the disk as a second hard disk from the desktop.

Question ? Is this a software problem or does it have something to
do with the ATARI host adapter board ?

Finally: anyone who is interested in how I got the first HD to work
(I also got a RODIME 204E (44MB) and a seagate ... (40MB) running)
please let me know and I can see if I can help.

Thanks in advance for your (hopefully numerous) answers.

5359. ST Video RAM

Newsgroup: comp.sys.atari.st
Date: 1988-09-06 14:40:10 UTC
From: ONM07@DMSWWU1A.BITNET
Message-ID: <8809061439.AA25221@ucbvax.Berkeley.EDU>
Source record: 250909

Date: 6 September 1988, 16:36:12 MES
From: Julian F. Reschke (02501) 13279 ONM07 at DMSWWU1A
To: INFO-ATARI16 at SCORE

Most people seem to be shure, that the video ram will always be 32000 Bytes,

and that resolution in monochrome will always be 640*400. But in fact, there are quit a lot companies in Europe making video cards with higher resolution. On the ATARI fair in Duesseldorf, approx. 1/3 of the software houses had monitors with 1280*960 points running their software - and yes, there is a GDOS screen driver for this monitor. So please use the informations you get when using V_OPNVWK or look at the negative LINE-A-variables.

Please, Atari, force the companies to support future video modes!

An emulation similar to the MAC-program 'SteppingOut' (sets video resolution at startup and scrolls when you move the mouse) will be published in the november issue of the german magazine 'ST-Magazin'.

// Julian F. Reschke

5360. Looking for details on Atari Floating Point 68881 support

Newsgroup: comp.sys.atari.st
Date: 1988-09-06 15:32:48 UTC
From: VBRANDT@DBNUAMA1.BITNET
Message-ID: <8809061532.AA26180@ucbvax.Berkeley.EDU>
Source record: 250910

This is directed primarily at the people at Atari, but since it contains both praise for Atari (!) and information that might interest others, I post it here.

I have just bought an "Atari SFP004(tm)" -- that's a 16 MHz 68881 FPU for the expansion slot of the Mega series STs. It comes in a grey cardboard box that's so new it still has spelling errors on it ('coprocesser' :-). I have had my dealer install it, and now it sits in my ST waiting for work.

All the people I asked, including my dealer and representatives of Atari Germany, used the same word for the software supplied with the FPU: "none". Now I reread the one (1) sheet of paper that came with the 68881, and I noticed that Atari *DOES* offer software support for the FPU, and I quote (from Atari document C300443-001 Rev. A):

"The Atari SFP004 Developer's Kit contains more information on the co-processor and the software you can use with it. The kit also contains a disk of sample source and object files for a set of high precision mathematical routines. (These routines are compatible with the Alcyon C compiler.)"

This sounds interesting ! Since I don't have the dev package, I don't have the Alcyon C compiler either, but 'sample source' would definitely be helpful. Unfortunately, Atari Germany knows nothing about this (as usual). The sheet also gives three addresses to contact for additional info: one in the US, one in Canada and one in the UK. Now for my questions:

- What exactly is in the 'SFP004 Developer's Kit' ?
- Where is it available ? Will it *ever* be available in Germany ?
- Where should I ask for more info?
- What is the 'suggested price' for it in the US ?

Also, the sheet lists two other sources of information, the Motorola 68881 FP Coprocessor User's Manual, which I have (thanks to Motorola UK, Ltd., for sending me a free copy when I just asked for general info !!!), and something called "Software links math chip to 68000/family ,uPs AR233 (Reprinted from EDN; Jan. 23, 1986)". What is this ? Could someone please tell me if this is a journal, magazine etc. ?

Finally, the praise to Atari: Thanks for making this product available, one that deserves the 'power without a price' label. (For those who wonder, the 'suggested price' in Germany is DM 398). One of the two other suppliers of FPU cards for the ST in Germany (Weide of Hilden, W.Germany) has already lowered the price for the Mega version from DM 898 to DM 498. Admittedly, they supply FP libs for 6 different compilers ... still, they are expensive.

Things aren't so bright on the software side as yet:

- Heimsoeth is working on 68881 support for Turbo C (no details yet). I don't know of other C compilers yet.
- "gdat" of Bielefeld have announced an APL.68000 version that incorporates 68881 support, but MicroAPL cannot specify any delivery date yet (I suppose MicroAPL spend more time working on their new Mac APL these days..).
- I'm trying to find out more on the OSS/CCD Pascal, but no answer yet.

If anyone out there has some PD source and/or binary for FP routines that make use of the 68881 FPU, I'd be *VERY* interested in a copy (if it's big, send email first).

Any and all info is most welcome indeed.

PS: This has grown rather long, but I thought it might be of interest.

5362. gcc problems

Newsgroup: comp.sys.atari.st
Date: 1988-09-06 16:26:00 UTC
From: jrd@STONY-BROOK.SCRC.SYMBOLICS.COM
Message-ID: <19880906162643.1.JRD@MOA.SCRC.Symbolics.COM>
Source record: 250912

Date: 2 Sep 88 10:51:04 GMT
From: stormy.atmos.washington.edu!jeff@beaver.cs.washington.edu (Jeff Bowden)

I grabbed the gcc executables a few days ago. I found that I had
insufficient resources to run it (sob :-( ).

Yah, I was afraid that would happen. Please, everybody, read the blurb
file (GNUBLURB.TXT) before downloading it. It's just too big for random
copying around. The blurb contains a description of what's where, which
pieces of the distribution you'll need to do what, and what system
resources you'll need to run it. Help keep net traffic down!

I uploaded it to a local BBS,
though. One person who downloaded it. This person has a quite bit of
experience programming on the ST but I don't think he knows a lot about
Unix.

Neither do I; that shouldn't make a difference.

> 31Aug88 From Ganelius
>I more or less have the GNU C compiler installed under MT C Shell. A major
>problem though is the lack of the run time library.

The runtime library is in GNULIB.ARC, available from all the usual
servers.

The library source was
>compiled with something other than the GNU compiler, apparently.

That's wrong. The library was compiled with the GNU 1.23.
Is a
>compiled library available? I ran into a couple of bugs in the compiler so
>far. The compiler driver does not recognize the command line options `-c' and
>`-o'.

That's also wrong.

Also most of its console output is missing carriage-returns.

That's never happened to me.
>
> Also, is a Unix compatible make utility available from GNU for the ST?

I don't know how compatible it is with Eunuchs, but the GNU MAKE util is
in GNUUTILS.ARC.

Since can't run it I can't be of much immediate assistance. Does
anyone here have suggestions? My guess is the MT C shell does command

line arguments differently than gulam (the shell used by the guy who did the port).

Yes, I'd guess that's true, but it's still a bit mysterious how it could get as confused as he describes. Could it be that MT upcases command lines before executing them?

I'd suggest he try it with gulam. Get it working that way first, then see what it takes to make it work with other CLI's.

Perhaps it also does environment variables differently.
(so the compiler merely can't find the library file as opposed to being unable to read it?)

That's possible as well. Still, from the text of his message, it sounds like something didn't like the format of the OLB, not that it couldn't find it.

I'm afraid more information is needed here.

5363. Re: ANIMATION QUESTION

[more deleted]
>Thanks,
>Robert L. White, Xerox Corp.

You don't need to re-copy the background screen into the logical screen each
time you draw a new frame, this takes a HUGE amount of time.
All you 've got to do is copy the section of the screen that the sprite
occupied in the previous version of the logical screen.

How about an example:
Show page 2 (Physbase = page 2, Logbase = page 1)
Frame 1: x1 = 50, y1 = 50; x2 = 50, y2 = 50
x = 50, y = 50
Copy the area from your background at x1, y1 to page 1
Move sprite to 55, 55 (x=55, y=55)
Draw sprite at x, y in page 1
Set x1 = x, y1 = y
Now show page 1 (Physbase = page 1, Logbase = page 2)
Frame 2: x1 = 55, y1 = 55; x2 = 50, y2 = 50
x = 55, y = 55
Copy the area from your background at x2, y2 to page 2
Move the sprite to 60, 60 (x=60, y=60)
Draw sprite at x, y at page 2
Set x2 = x, y2 = y
GOTO Frame 1

I've found this to be a fairly quick solution to sprites in software,
but feel free to mail me with more questions (specifics).

I saw (and touched) one in April in Dundee, Scotland. It was, according
to the Atari guys, the only one in existence at that time. It was very
much a prototype, a kludge using a mega st2 as a front end (I was told
that production models would have the mega part of it built in). The
graphics demos running were quite impressive but the OS didn't impress
me... sort of a un*x clone not done quite right. The shell looked like
a combination of csh and pc-dos. But then again, this was quite a while
ago and it was very much a pre-production demo.

5365. Atari fair at Duesseldorf (West Germany)

Newsgroup: comp.sys.atari.st
Date: 1988-09-06 18:19:15 UTC
From: AB084@DK0RRZK0.BITNET
Message-ID: <8809061721.AA27884@ucbvax.Berkeley.EDU>
Source record: 250915

I'd like to report on the event mentioned in the subject line.
Please do not expect a profound analysis. I will give a collection
of personal impressions and observations.
1. Turbo C
It exists and they do already SELL it. There was a special offer for visitors
of the fair: The compiler at DM 150. Assembler and debugger exist but are
not yet released. We played around with the compiler for some time. Really
neat| Fast, easy to handle. Acceptable editor. Just real Turbo C.
We found a minor bug in the include library (a declaration missing in
<time.h>), so they have chances to further improve the product. A great
compiler im my opinion. We compiled dhrystone V1.1 (V1 would not give
any meaningful results for unknown reasons) and got 1706 dhr/sec.
I think I'll buy this package unless gcc proves to be comparable.
2. The Transputer (former ABAQ)
The box they showed there was obviously a prototype. No one would buy it
in that shape. I mean its look. The thing seemed to work, although as
it appeared, it isn't terribly stable. Dhrystones 3170 (V1.1) and 2270 (V1).
The shell is very csh-like, I found no obvious differences. The diff
doesn't do anything reasonable. We tried it on two files which happened
to be identical and it wrote kilobytes of differences to the screen.
Piping the same command through more made the system break down and weep.
It had to be booted a couple of times while we played with it.
Invoking cc with only a source file and no options as arguments wrote
assembler code to stdout. But one can do it in two steps, first call
cc -S source.s source.c
and then
asm -o text /lib/cstart.o source.s
Oh, and by the way, occasionally the source file had size zero after the
invocation of cc.
They had MicroEMACS 3.8 running. X-Windows do not work yet, that's why shell-
windows had a fixed size (a quarter of the screen, a little too small for
80 character display).
There seems to be no job control (according to the guy at the booth, he was
nice and helpful but I would hesitate to call him an expert).
cp'ing files did not work reliably, we found that the probability of
successful cp'ing was bigger after cd'ing to the target directory.
A FORTRAN compiler was said to exist, but it was not shown. Same for Pascal.
3. Beckemeyer products.
Gerd Sender presented Micro C-Shell, bdt's multitasking OS, and related
products. I Germany these are not so popular as in the States (as far as I can
tell from the net), and I saw them for the first time. I felt at home immedi-
ately, you know, I'm used to a UNIX environment. I had the impression, though,
that it isn't extremely fast, but that may have been the slow disk's fault.
They told me they could not sell us any campus licenses due to conditions

imposed by Beckemeyer Development Tools. (Is that true, David?)
4. Misc.
A Company named Pluennecke presented PROSPERO compilers. Knowing their FORTRAN and Pascal, I would have liked to see their C. But the guy there was so unfriendly and arrogant that I would not talk with him any longer.
We played with Laser C (833 dhr/sec V1.1), Lattice was also shown. I missed MWC, don't know why it's so rare in Germany. I believe they are still selling version 2.x here.
68030 box: Not shown, no comments.
5. Operating systems.
They showed an ST with TOS 1.4. Unfortunately I had no time to play with it. Otherwise a total miss. I found people selling OS-9, but they would not show it because they were demonstrating their network software.
I greatly missed Idris. I have never seen anybody in Germany to sell it. I don't know why. This market is just as important for the ST as the States, maybe even more. Maybe it'll be Minix then...
6. General impression
Nice coloured pictures, few hard facts. Games. A little disappointing. When I talked about this to somebody at one of the booths, he said to me: "What do you expect of a dying computer?"
7. Date
Sep. 2-4
That's it, friends

No-one here is, to my knowledge, considering this TOS 1.4 to be the last release. Rather, it is a stabilising release that can be used as a baseline for expansion to the ST product line.

Leonard Harris writes (roughly) that Mr. Drapal is justified in using the net for his complaints about this UNRELEASED Atari product, because he MIGHT not have gotten a reaction to communicating with us directly.

To summarize Dave Clemens, I have been right all along:

> ... of the three "bugs"
> reported by Myron, two have apparently already been fixed, and the
> other is not a bug in the ST system [... because of DOS 1.x or clone].

What better response do you want than "it's already been fixed" and "it's a problem with your clone / OS level, not the Atari OS?"

What Mr. Harris has temporarily ignored is that the "product" that Mr. Drapal is complaining about isn't a product at all: it is a test copy of the new OS. If we shipped that as a for-real, costs-money product, he would be justified in commenting on it publicly. However, since it is not, he is not justified. Perhaps, as Mr. Harris says, if he had gotten no response when talking with Atari directly, he could have complained about *that* to the net. But he didn't try.

Look at the history of this whole thing:

Atari ships TOS ROMs to subsidiaries, for testing and translation.

Mr. Drapal discovers (personally or indirectly) some problems.

Mr. Drapal goes on the net and bashes Atari.

Atari replies that the things he is complaining about have been fixed, and asks him not to post problems with this UNRELEASED product to the net.

Mr. Drapal continues flaming Atari on the net.

Atari replies, again, that we have already addressed the things he mentions, and again asks him to stop posting about this.

Mr. Drapal continues...

...and so on.

Am I being unfair? Look at the signal/noise ratio of Mr. Drapal's postings as compared with Atari's. Look at what he says and how he says it, and compare with Atari. Look at the fact that he has been WRONG on virtually every point he's made. Then judge.

Hi there, net-people. I was just wondering if someone would be kind enough to fill me in on all the Atari ST news from the last three months or so. I've been gone from the net, and now I find all this new and interesting stuff, but I don't know what's going on!

Anybody who's willing to e-mail me some information on the new TOS 1.4, the Atari ST laptop, or anything else that's passed through this discussion, THANK YOU.

--R.J.
B-)

P.S. No cute signature yet, haven't had time to redesign 'em...

> that lost 2 clusters on a disk. But what if you put a the disk in a mchine with
> old ROMs? It can't read the last two clusters! So, sadly, the bug stays.

Are you sure that the old ROMs can't read the last two clusters
on the disk? The one time I did some testing on this (about 2 years
ago) I found the ST could always read every cluster on an PC/DOS
formatted disk, including the last two clusters. I spent a fair amount
of time working on this since I was writting a PC/DOS style CHKDSK
program. I wanted to make sure that the two missing clusters were
really missing and not an artifact of my program. I spent a lot of time
formatting disks on both my PC and my ST and comparing them. My
conclusion was that GemDos was quite happy to read a disk using the last
two clusters. It also could delete files that used those clusters. It
just couldn't write to them and also didn't include them in the disk
free space calculation. This means you should be able to fix the
free-space bug in GemDos without breaking STs with the old ROMs.
The old machines could still read the files written by the newer ROMs,
just like they can read files on a PC/DOS disk.

On the contrary. But Netnews should NOT be used to say incorrect, bad things about UNRELEASED, PRELIMINARY, TEST VERSIONS of Atari products.

If I were under contract to do a computer simulation on a new design for a car from Ford, and I found a bug in the design, I wouldn't write a letter to the editor of Auto Week about it.

I hope I can quench the flames about this FAST...

To summarize "GWDGV1::WHUEBNER":

> 1) the IBM PC don't like a disk formatted with the new TOS release ...
>
> 2) it seems that pressing ESC didn't flush all buffers...
>
>[3] [open a window, pop the disk, change it on a different ST, put
> it back in the original ST and do something.]

First and most importantly, yes, we will ask this tester not to post
to usenet about the Beta ROMs.

Second, we all know that point (1) below has been fixed.

Third, pressing ESCape on the desktop now DOES cause the ST to forget
everything about the disk in the drive, and invalidate its caches,
even if the serial number matches.

Fourth, the ST has NEVER been able to handle a disk which is removed,
changed on another machine, and placed back in the drive. The reason
is that the serial number is still the same, so the ST assumes the
rest of the disk is the same, too.

The fix for this is to put a DIFFERENT disk in the drive and access
it before putting the changed media back in.

The rationale for this is that you might pop a disk, to read the label
or change the write-protect tab, then place the same disk back in. If
the ST invalidated everything as soon as you popped the disk, this would
be disasterous: you would get lost clusters and closed handles.

From: good@atari.UUCP
Message-ID: <1161@atari.UUCP>
Source record: 250924

I had said I wouldn't post any further on the TOS 1.4 issue, but some valid points have been made in the latest postings that I feel warrant it. I know I won't cover everything that is in people's heads, but here goes..

First, I *sincerely* want to thank Myron Drapal for his most recent posting (as a follow up to Allan Pratt's response). But we are interested in discovering the source and vintage of the TOS 1.4 which he had access to! [:-)]

It was commented by more than one person that comp.sys.atari.st has for some time been the forum for bug reporting/follow-up. With TOS 1.4 Beta, we carefully set up a Product Tracking System, explained in previous postings, with an associated System Problem Report 'electronic' form, and requested, in the accompanying release notes, that all problems be reported in this manner. The aim is to centralize and formalize bug reporting, so that obscure (and not so obscure) problems are filed in a database and don't drop through the cracks. Thus worldwide posting of this problem (PC/ST media compatibility) and others went against the directions of the Release Notes (as did the apparent proliferation of the Beta copies). As an aside, have you ever noticed how companies with which IBM do business keep their lips really sealed when asked about their relationship to Big Blue. Now IBM has a LOT more clout than Atari, but the principle is the same - a mutual trust and a desire not to taint a product before it has had a chance to be tested and corrected prior to release. (OK maybe the mutual trust isn't always there, but I bet a written contract/nondisclosure agreement IS! [:-)]).

Had the original posting been, instead, a direct email to me, or to Allan Pratt, it would, like others, have received a direct response.

One poster asked for the Product Tracking System to be made available to all. This is indeed an aim, but it is an evolutionary product. We first sent it to subsidiaries, to get their impressions and to see how it could be improved for communication, reporting etc. Now it is going to registered developers. After a shakedown with, and feedback from, them, we should be in a position to make it generally available as a vehicle for posting bug reports and requests for enhancement.

Re: the tenor of my direct posting. I stand by what I said regarding potential damage, and use of the airwaves. Some folks at AT&T/Denver are concerned that AT&T might cut off 'news' using this as an excuse. I hope not, at least not for technical categories (all companies must look at costs - they have a responsibility to shareholders - and so some reduction may be essential). The 'news' system is an incredible vehicle for the dissemination of views and opinions, but it is one which is very easily abused, both in content and volume. And it must be remembered that, at the end of it all, it is your CUSTOMERS who pay for it eventually, since it a cost of doing business as

far as the company (employer) is concerned. Thus access to it through corporate channels must be viewed as a privilege.

I have been accused of threatening legal action. I certainly don't believe this is the case, but I do believe that propagating a discussion of this ilk, on unreleased product, is detrimental to Atari's position, since it leaves an impression of the product before it is even released. The primary aim of the Beta release to subsidiaries and to developers selected by the subsidiary, apart from wider test exposure, was to avoid some of the unexpected problems which occurred when the Mega ROMs came out, by giving key developers advance notice and a chance to test and correct problematic code. The current "Developer Release" takes that one step further.

I have received several 'emails' of support, some of criticism, and some of "enough!!!". I feel that points have been made on both sides, although really there is just one "side" beneath it all, with the goal of providing an acceptable product. And I trust that the points are well taken by all who read them.

** AN IMPORTANT BIT RE: REGISTERED DEVELOPERS **
It seems that more than one or two posters, Mr. Drapal included, are frustrated that they have ante'd up their $300 (or more) and not heard of anything since (tho' others say they get regular info). I'd like to suggest that those who feel they have been orphaned send me email directly (ie not to the net) in the following format:
Subject: Orphaned Developer
[text] Name, Address, State, ZIP, phone, approximate date of subscription
if appropriate: original address, if you have moved
last item/package you recall receiving

I will collate all responses upto, say, the end of next Monday (12th), and forward them to Cindy Claveran.

5375. Status on rec.games.pc proposal

Newsgroup: comp.sys.atari.st
Date: 1988-09-06 23:24:24 UTC
From: jennifer@jato.Jpl.Nasa.Gov
Message-ID: <131@jato.Jpl.Nasa.Gov>
Source record: 250925
Cross-posted to: news.groups,comp.sys.atari.8bit,comp.sys.amiga,comp.sys.atari.st

By popular demand, I've changed the name of the proposed group to rec.games.micro. This should make it clear what the purpose of the newsgroup is, without implying that the group is for the IBM PC family only.

I'd like to address some of the comments that have been made regarding the newsgroup. First of all, there has been the comment that rec.games.misc is sufficient for handling the traffic in microcomputer game help. I agree with this, but the problem is that everyone doesn't seem to know that that is where they should post help messages for microcomputer games. Therefore, they post in the .sys groups, or occasionally rec.games.frp or other groups. If there was such a group as rec.games.micro then it would be clear where the messages were to be posted. I do not propose that the rec.games.micro group include games originally programmed for UNIX/VAX systems, since there are already several newsgroups (rec.games.rogue, rec.games.hack, rec.games.moria) that support those games. Rec.games.misc can now be a repository for games that don't have their own newsgroup such as Omega or Phantasia or Xword.

There has also been the comment that this group won't cut down on net traffic. I believe it will cut down on net traffic because there won't be the same messages about the same games throughout the .sys groups. Most microcomputer games have been converted to more than one system, and therefore the same messages about these games can (and do) appear in more than one .sys group. A clear example of that is Bard's Tale. There is an advantage to the person playing these games also, in that if he's playing a game that is a later conversion from the original, then in rec.games.micro, he can probably find someone who's played on a different computer but who's finished the game. The advantage to the people reading the .sys groups is that they don't have their group cluttered with game messages that should really go into the rec area.

There was a comment about moderation--if someone wants to moderate this group, fine. _I_ can't moderate it, and really, I don't see the group as having too much "noise" so I don't think moderation is necessary. The only thing I can see moderation doing is to prevent the requesting of copyright information, and currently rec.games.misc readers don't do much of that.

Now for the current vote tally-73 YES 15 NO. I will post another
tally in two weeks.

I have just checked out exactly what MY PC wanted in the way of bytes to recognize an IBM disk, and as far as I know, Byte 0 has to be 0xEB, and byte 2 has to be 0x90 in the boot sector (from an 11/28/85 formatted disk on the ST). That's it. (The EB is a short jump to the real boot code, byte 1 would be the displacement; the 90 I have no idea about).

You can try changing these with a sector editor. If your PC doesn't recognize this, then perhaps it is time you changed your BIOS. (Perhaps real release copies of both PC and ST software might help things - an article in the current "Computer Shopper" indicates problems with software from Sham Shui Po).

(I am also not absolutely sure that *both* of the above bytes are necessary, it seemed to accept the disk after reporting an error with only 90H there, but that wasn't consistent).

There won't be a 128K Magic Sac. Dave Small posted here a couple of weeks ago about why not. Basically he left the company in March/April and they don't have a programmer with the ability to create a 128K Magic Sac.

Dave is coming out with a product called Spectre 128 --- but I don't have the details on it yet.

later, david

[more stuff deleted]
> 1. NETNEWS was the accepted forum for bug reporting, especially when
> Landon and Alex were employed at Atari.

I have no problem with responding to bug reports of released products
via netnews. In fact, this practice may come into play more, as the
Developer Release of TOS 1.4 makes it into developers' hands. The fact
is that we are establishing a formal method for reporting bugs and
suggesting enhancements to Atari products. The front end of this method
is a program that I wrote, SPRgen, which went to the subsidiaries with
the beta release along with instructions on how to report bugs in the
beta release. SPRgen is also included in the Developer Release, with
instructions on how to report bugs/enhancements in that version.

> 2. Most registered developers have not been receiving updated documents
> or information regarding new bug report procedures.

Most? I don't think most. Some certainly haven't recieved
updates (three have mentioned it on the net). The developer mailing
list needs to be updated. Roy has since suggested a way that people in
net-land can ensure that they are on the mailing list.

> 3. Instructions for reporting bugs should be made available to all
> owners - not just a few "selected" registered developers.

As Roy has mentioned, the plan is eventually to release SPRgen
(a GEM application with a simple user interface and complete instructions
on how to report problems) to all Atari users. SPRgen is still a little
rough around the edges. We felt it would be best for registered developers
to have at the program before we unleash it to all Atari owners.
This will also allow us to streamline the operation of the PTS database
internally, so things go smoothly when SPRgen is in the hands of
John Q. Atari User.

>> [Allan Pratt again:]
>> Please cut it out.

We really do want the feedback. What we don't want is unsolicited
reports of already-fixed bugs in products that aren't released or supported.

>> I post this in public because the offense was committed in public. I am
>> also sending mail, because that is far less likely to be overlooked by
>> the intended recipient.
>
> Ditto.
>
> I'm afraid that the only offense that I'm guilty of is telling the truth
> in a public forum. For that, I plead guilty.

I have kept my virtual mouth shut through the course of this
discussion, but I felt that as the PTS coordinator and a TOS developer,
I should tell "my version of" the truth. Until I was hired by Atari,
I was on the recieving end of Atari developer support for quite some
time. Hopefully my experience will have some influence on how I support
developers via the Product Tracking system and other forums.

I would like to thank Mr. Drapal for his concern, and I hope
that he continues to contribute in the future by sending his System Problem
Reports about the Developer and future releases of TOS.

[lots more stuph deleted]

Who cares?

The bug *was* in the Beta ROMs.

Beta is now over (has been for sometime).

Bug has been fixed.

Beta was successful as far as this bug went.

We are discussing history. May we please discuss the present? Like how developers can get the Developer Release of TOS 1.4 and other new software (Allan's superb DB, new ALN, new MADMAC, and SPRgen). Like how a bug reporting/feature request system has been put into place?

I'm sick and tired of all this. Please stop. This poor Canuck can't take it any more. :-)

Though, while I'm here, I want to comment on 'Beta Test Sites'. Everyone wants to be a Beta Test Site. Of the seven sites that I released Beta ROMs to, only two ever provided useful bug reports. Needless to say, only those two will ever be used again. All Beta Sites signed legally binding agreements not to copy or publicly talk about bugs. Yet, somehow, Beta ROMs leaked out (See a recent issue of the U.S. ST World). If we where mean and nasty, the lawyers would have a field day. But we're not. All we ask is that you report the bugs privately through the channels that have been put into place.

[Rest deleted]

I beg to differ... My experience with my very own 4 month old Atari SLM804
laser printer on a Mega ST2 (mono) has been EXTREMELY FAVORABLE. In fact,
when I switch over to a QMS-810 Plus PostScript(tm) compatible laser
printer, I worry about whether everything's working fine -- it takes so
long! The problem you experienced is with the way that particular software
package (Publishing Partner from Soft Logic...not Personal Publisher, there
is no such thing for the ST) prints; that program basically doesn't support
direct GDOS output to the SLM804... It requires you to load the emulator
software provided with the laser printer and send HP commands...

A program like Timework's Publisher ST with full GDOS support is LIGHTING
fast (as mentioned in another posting from a gentleman representing Atari
Canada). The new version of Publishing Partner, PP II, is said to work
best with the Atari Laser printer... Maybe if the right program was out
at the time you looked at the ST system, you'd be using a different computer
right now..

Incidentally, the only thing that slows the SLM804 under Publisher ST is,
ironically enough, GDOS -- or rather, the way GDOS is set up. I'm not
entirely familiar with the exact procedures that program goes through to
print a document with multiple fonts/complex graphics etc.. but it seems to
load certain GDOS fonts when needed and maybe write temporary files to
disk... Once it's all loaded, you hear the whir of the printer and zoom,
output of a VERY complex page in under 2 minutes -- seriously!
(Same page on the QMS was about 10 mins. due mainly to the scanned art...
neat thing is, Publish It! from Timeworks for MSDOS things is the same
program -- working under GEM 3!)

Sorry about the length -- just can't let anyone bad-mouth my favorite
Atari add-on!! Nice job Atari!

5384. Re: Bugs in new BETA ROMS?

Newsgroup: comp.sys.atari.st

>
> Myron Drapal
> AT&T Denver
> att!druhi!med

I find this hard to believe for one simple reason, and it can be summed up in the following question: Are YOU an OFFICIAL beta tester of the new ROMS?

You have admitted yourself that you are not. Therefor you have illegally gained access to said ROMS, and then begin publicly shouting about things you found wrong with ROMS you were not supposed to be using/looking at.
Atari's main purpose has not been to just hush you up, it has in fact been to say you should not be reporting bugs 1) over comp.sys.atari.st and 2) at all as you should not have the ROMS. Atari has never said that they were unaware of the bugs you have mentioned, the Beta-testers may have already recieved notice of the bug once it was reported THROUGH PROPER CHANNELS.

Why didn't you just mail the report to Atari? Why did you have to post it here? Did you have any other reason than some subtle Atari Bashing? If so, I would love to know why. I would assume (oh oh ass/u/me) that the person that actually has the Beta-test ROMS has already reported what you have found thru the SPR system included with the Beta-test kit, so why did you have to post it here as well? Or do you in fact own a pirated copy of the ROMS?

I for one would like to thank Allan & Co. for the new era of support we have begun to see from Atari, and the flow of information we have been seeing lately. To me it seems to be an indication of good things to come.

Bob King
king@akov11.dec.com

Hey, I certainly don't dictate policy for DEC, so these opinions are mine alone. Flame away, I expect no better.

I agree. One should avoid messing with video memory if possible. Likewise,
Atari should make this feasable by updating the software blit and draw routines
so that there is no unreasonable slow down from using system graphics calls.
OR get the blitter into all the STs out there :-)

In fact, there IS a vector table for the BIOS-level I/O-functions since the blitter TOS. Sadly, it's not yet documented officially. Why not add public vector tables for all GEMDOS functions? This would make patching GEMDOS routines easier *AND* faster, because there would be no need to install new trap dispatchers. This would people keep from writing own trap dispatchers too (they won't run on 68020- or 68030 systems).

> Apple Talk networks? I know that there is an Apple Talk card for the IBM and
> being able to use the Apple Talk net would be nice for both businesses and
> colleges.
>
> Any word on this?

There will not be a 128K ROM "Magic Sac", no matter what Data
Pacific's newsletter says. Dave Small no longer works for Data Pacific
he has his own company, Gadgets by Small.

Gadgets by Small is going to release the "Spectre 128" at the
Glendale Atari show. If you want more information you should contact
Dave at:

Gadgets by Small
40 W. Littleton Blvd. #210-211
Littleton, CO 80120
(303) 791-6098

As of now the "Spectre 128" does not support AppleTalk since
there are no AppleTalk compatible interfaces available for the ST. I'm
sure Dave will look at AppleTalk if/when someone starts selling an
interface that can handle it.

Source record: 250942

Last night I booted my ST WITHOUT Turbodos for the first time in many months. (The reasons are interesting, but not relevant here) When I tried to run an experimental GCC that I'm working on, it died with wierd errors. A bit of investigation revealed that when trying to start the executable for compiler pass 1, the image loads, then dies immediately with error code -66; bad executable format.

I rebooted with Turbodos enabled, and it worked!

I poked around some, but couldn't come up with any plausible reason for this behaviour. The executable was produced with the same linker I've been using for a while, with no ill effects. The only thing that seems at all funny about it is that it's enormous (395K).

Has anyone ever seen anything like this? The fact that Turbodos fixes it suggests that it might be a known bug (after all, it fixes the bugs in slow memory clearing, slow FAT scanning... :-}); perhaps it's fixed in new ROMs or something? I'm still running the 11/20/85 jobs.

Any and all information will be appreciated.

Message-ID: <QX9LXEy00V4A0A3UgZ@andrew.cmu.edu>
Source record: 250946

Hi, netlanders...

I am having severe difficulties adding help synopses to helpfiles (used
by help.ttp), and in getting help to correctly change the help index file.
The manual to MWC states that one is supposed to put a '#' in front
of the new synopsis, but that doesn't seem to work. The synopses
that were already included in helpfiles were preceded with a '@',
but putting '@'s in front of the new ones also didn't seem to help.

In addition, the command 'help -R fubar' as explained in the manual,
doesn't seem to work. It apparently does the help -R, then does a
help fubar (it usually can't find fubar). Additionally, I have tried
'help -R', and this seems to partially reindex the helpfile, but it doesn't
work fully either.

As far as I know, there are no irregularities in the text that I
cut-and-pasted into the helpfile Additionally, I interspersed all of the
newly added synopses into helpfile alphabetically.

I have MWC version 3.0.5, and msh Version 3.0 (I think).

By the way, the reason I am posting this question rather than writing a
letter to/calling Mark Williams is that I haven't received notice of
my registration back yet.

Thanks in advance for any help...

From: good@atari.UUCP
Message-ID: <1163@atari.UUCP>
Source record: 250948

All subsidiaries have now received a copy of the SFP004 Developer's Kit,
which includes demos, sample routines and documentation. There should be no
reason why they cannot provide information.
Available applications and compilers is a separate issue, over which we have
little control. All major compiler developers have been notified of the
hardware addressing used (remember, this board operates in peripheral mode
rather than coprocessor mode, in Motorola terminology). The sample code
would allow you to "hand-carve" code to access the chip in 68K assembler,
but it is up to the compiler people to generate object code directly from
C, or have "intelligent routines" which can use the 68881 or emulate it.
And once the compilers are there, applications will follow. Most of
this is documented in the Dev.Kit manual, or in the sheet included with
the SFP004.

The 'three addresses' (US, Canada and UK) are cited for one reason only -
this is the English/American [:-)] manual, and not the final native language
one (ie the German one will indicate Raunheim, the French one Atari France etc)

> - What is the 'suggested price' for it in the US ?
>
We have not set a price on it - it is part of the Developers' Kit update
($20) which also includes the TOS 1.4 Developer Release.
> "Software links math chip to 68000/family ,uPs AR233 (Reprinted from
> EDN; Jan. 23, 1986)". What is this ? Could someone please tell me if this is
> a journal, magazine etc. ?

This is Electronic Design News, a US periodical. I am sure European computer
mags have run similar articles about 68000 (rather than 68020/030) interfaces
to 68881.

>
> 68881? What's this? Real floating point support on our STs?
Ooops!
I should have noted that the SFP004 is an add-in board for the Mega, not
an external package for an ST. Sorry guys/gals.

If code is correctly written per Motorola standards, it will execute
correctly on both '881 and '882. But code can also be writen to
exploit the 'parallelism' of the '882, and lose compatibility.
SFP004 is shipped ONLY with an on-board, socketed, '881.

From: mpsimon@phoenix.Princeton.EDU
Message-ID: <3605@phoenix.Princeton.EDU>
Source record: 250802

(If my memory serves me correctly, this text editor has been out in Europe for quite awhile. Hence the world distribution.)

The other day I saw an ad for Signum available in the US. This is the first technical word processor that I have seen advertised here. I would like to find out as much as possible about the availability of technical word processors for the ST. Is TeX available? There had been rumors of a pd release.

Questions about Signum:

1. Will it support a color monitor? Will it work on a 1040 ST? Does it require that I have a hard drive?

2. What file format/printing options? I.e. does it produce DVI output files, can I print to an Epson compatible, or to a postscript printer?

3. Will it support graphics figures in the text?

4. Suggested retail price in the USA? (STPlus has it advertised for $250).

5. Any major or minor limitations encountered by current/previous users?

What else is available in the US?

I have the latest version of AnsiTerm (direct from Beckemeyer's Dev Tools) together with registration card, manual and diskette, which I like to sell. AnsiTerm is a terminal program which supports Vt100, Kermit, Xmodem, etc. The interesting feature of this program is that WHILE you're doing file transfer, you may invoke another shell, hence allowing you to do other things or run other programs.

Send me $16 with a self-addressed-stamped envolope (roughly $1.50 postage) and i'll mail the package to you, which includes the original diskette, manual, and registration card. The reason I'm selling it is because I just bought SHADOW and have ceased using AnsiTerm.

>free space calculation.

OK TOS 1.0x can read the 2 clusters but I would say that not being able to
write to the clusters was a good enough reason not to fix the bug.
ie. "Hey I just changed one word in this file I'm editing but I can't save it
back to disk! What's happening" - "Oh your still using the old ROMs. Sorry"
(usually followed by "my ROMs better than yours, it's got ..." :-)

I still think that all bugs should be fixed and backward compatible patch be
ditributed. Maybe it's too late for 1.4 but what about 1.5

5407. MSX Emulator request

Newsgroup: comp.sys.atari.st
Date: 1988-09-08 09:04:00 UTC
From: VDGRIEND@HEIIPO5.BITNET
Message-ID: <8809080757.AA11461@ucbvax.Berkeley.EDU>
Source record: 250807

Dear Netlanders,

Does anybody know of any existing MSX Emulator for the ST ?
I would be interested as the MSX computers are used at the primary schools
here in Holland with 'educational programs'.
I presume the ST can read MSX disks with ease ???
The MSX seems to have the same sound-chip on board.
There is already a CP/M 80 Emulator wich also emulates a Z80.
Maybe the biggest problem is the incompatability of the graphics screen.
If I remember well the MSX has 128 KB for screen memory (the ST 32 KB !)

Any Info will be appreciated !

Henk van der Griendt (EARN/BITNET/NETNORTH: VDGRIENDT@HEIIPO5)

>I rebooted with Turbodos enabled, and it worked!

Yes this is a known bug: gcc is so big that the relocation table is larger
than 32KByte. Old ROMS cannot handle this, JAMDOS and TURBODOS can.
So can the new Beta 1.4 ROMS (in RAM).

Thanks, John,

But, I just got a message from Cindy on Genie, saying she had given me
developer access. She also said that she had been out of town.
I assume that the person who was filling in for her didn't quite know
about all of the developers. Sorry I got upset, but I had no idea that
she was out of town. Some one sent me messages with her name on them saying
they had no record of me. I wouldn't have gotten upset if I had known
that she was gone.

Nick

In article <3525@druhi.ATT.COM> dlm@druhi.ATT.COM (Dan Moore) writes:
> Are you sure that the old ROMs can't read the last two clusters
> on the disk?

I didn't say that. I said we couldn't fix the bug for compatibility reasons.

You are exactly right: the old ROMs can read the last two clusters, just fine; they can even write to them if a file is already allocated there and you are overwriting that part of the file. What they can't do is extend a file into that part of the disk, and they always report that space as used when you use the Dfree call.

Imagine the following setup:

A company produces an application on new ROMs, and the application plus its support files EXACTLY FILLS a new-ROM disk. By chance, the DESKTOP.INF file which the company provides on that disk is in the very last cluster of the disk. (Remember, that's the last cluster of a NEW ROM disk.)

The poor, hapless user with old ROMs dutifully copies this master disk to a working disk, then changes his palette using the control panel and chooses "save desktop." What happens? The desktop does an Fcreate, which deletes the old DESKTOP.INF file. The Fcreate succeeds, but the Fwrite doesn't, because there's no space on the disk! (As far as the old ROMs are concerned, there is actually -1K used!) Poor user.

This scenario isn't really stretching too far, and there are lots of variations on the theme. It creates a situation which we are willing to pay 2K per floppy to avoid. 2K is, after all, only 0.55% of a single-sided disk, 0.27% of a double-sided disk, and infintessimal on a hard disk. Yes, it was a bug in the original GEMDOS, and yes, we know how to fix it, but it would be problematical to do so.

This is a known bug: if a program file has more than 32 kilobytes of
fixups, Pexec dies horribly. It's fixed.

From: dorian@pawl20.pawl.rpi.edu
Message-ID: <1149@imagine.PAWL.RPI.EDU>
Source record: 250818

I've been trying to transfer files between my ST and the UNIX box it's been hardwired to.

It seems that no matter what I try (any combination of xmodem, kermit, straight capture), I run into problems. Tried FLASH and AnsiTerm.

The problem is that everything blazes by too fast for my setup at 9600 baud - lines are chopped in captures, xmodem & kermit can't seem to get themselves syncronized with what's happening on the other end.

Is there any way to solve this without having the line speed cut to 4800 baud?

Much thanx.

5420. Becoming a developer

Newsgroup: comp.sys.atari.st
Date: 1988-09-09 03:33:19 UTC
From: saj@chinet.UUCP
Message-ID: <6540@chinet.UUCP>
Source record: 250820

This seems to be of general enough interest to ask it publicly. How (in
sickening detail) does one go about becoming a registered ST developer?
I have heard the amoun $300 mentioned several times, but nothing else (well,
there was something a long time ago about $100 for the documentation set,
but that wouldn't seem to include such valuable thing as the privilege of
purchasing the 'version 1.4 readiness kit'). Since the developers's kit
is reputed to include Mark Williams C (although the Mark Williams Company
denied that when I asked them) is ther any special consideration available
for those who already own it? I hear talk of newsletters and updates.
What DOES a registered developer get in addition to a large box of documents
and the new materials that were recently mentioned in this group? And
of course the usual question to get me ready for the predictable next time:
where SHOULD I have learned all this stuff instead of asking the world?

In article <JEFF.88Sep2035059@stormy.atmos.washington.edu>
jeff@stormy.atmos.washington.edu (Jeff Bowden) writes:
>I grabbed the gcc executables a few days ago. I found that I had
>insufficient resources to run it (sob :-( ).

Gcc can be run on a 1 MB machine! You will not be able to compile any larger
files from GULAM, but you can revert to compiling from the Desktop if memory
is a problem.

To bootstrap you NEED:
a copy of gulam
a diskeditor

1) patch the executable of gcc-cc1.ttp so that only 300 kB of stack instead
of 500 kB are allocated (you can search for the value 500000, it only
occurs once, somewhere around 364kB). [That you have to do this is really
a bug, there is NO need for a GEMDOS only program, that doesn't exec
another program to give memory back to GEMDOS, I'm changing my crt0
so that it will take -1L in _stksize to mean: "Don't do a Mshrink"]

2) Now throw all resident stuff out (accessories etc. just keep GEMBOOT
or folderxxx (you do have a HD?)), start gulam and setup the enviroment
as described by jrd. You should now be able to compile most programs
(you can compile all of flex except parse.c and scan.c for an example).
This is a good time to get the sources and extract the documentation
from them, how else are you going to know about -mshort
-fomit-frame-pointer etc.?

3) If a source file is too large to be compiled from GULAM, you will get
a "no more virtual memory" message or someting like that (probably
already from gcc-cpp). You can workaround this by running the
compiler from the desktop, the current gcc.ttp will NOT work from the
desktop (reasons follow), so you will have to write a small wrapper
program to do this (I'm fixing gcc.ttp right now.....).

Note:
all gcc stuff assumes:
file-handle
0 = stdin
1 = stdout
2 = stderr
since the GEMDOS default for handle 2 is the serial
port, this isn't much good when you start stuff from
the desktop.

So you need a
Fforce(2,Fdup(1))
At the begining of your program to see any error output
(and due to a bug in stdio to see any output at all).

Trying this shows two bugs in the current runtime library:

- Fforce has a wrong binding in osbind.h,
it uses 3 short (aka 16 bit) arguments!
Write a trap-1www function to do this.
[BTW is anybody working on cleaning up
the library, there is a lot of stuff that
should be done]

- stdout uses GEMDOS handle 2 instead of 1
(I haven't actually found the location of the
bug yet, but the symptoms are (every thing
from the desktop naturally.....):

Works:

```
Fwrite(1,.....
Fforce(2,Fdup(1));
Fwrite(2,.....
```

Doesn't work (first line doesn't get output):

```
fprintf(stdout,"%s\n","Test of stdout");
Fforce(2,Fdup(1));
fprintf(stderr,"%s\n","Test of stderr");
```

Works:

```
Fforce(2,Fdup(1));
fprintf(stdout,"%s\n","Test of stdout");
fprintf(stderr,"%s\n","Test of stderr");
```

Don't get put off by this description, GNC CC is worth it!
(For the Turbo C people, there is a note in the manual about
using registers for parameter passing in future versions......)

Bingo! LaserWriter II series (NT and NX) have PostScript 44. They also have
2M RAM, more than the LW {Plus}. Thus they are speedier. I haven't had a
chance to do any real comparisons here; anyone care to comment?

Also note that later versions of the LaserPrep and LaserWriter driver have
vastly improved performance.

5424. Tech Magazines, a suggestion

Newsgroup: comp.sys.atari.st
Date: 1988-09-09 14:47:59 UTC
From: mccarrol@topaz.rutgers.edu
Message-ID: <Sep.9.10.47.55.1988.5061@topaz.rutgers.edu>
Source record: 250824
Cross-posted to: comp.lang.misc,comp.sys.misc,comp.sys.amiga,comp.sys.mac,comp.sys.atari.st,comp.sys.ibm.pc,rec.mag

In several of the recent posts about the deterioration of the technical magazines, people have been asking, basically, what can be done for our type of user - the advanced, literate, technical programmers.

Well, I do have a suggestion. For quite a few years now, Science Fiction fans have been doing "fanzines", which are basically magazines, written, published, and distributed at cost by the fans who read them. They do tend to be much less "pretty", or "professional", but the material inside can be extremely good, if the contributors care about the 'zine.

I see no reason why a similar idea could not be applied to a programmers magazine. It would be a lot of work for the people involved, but if people were actually willing to contribute articles and code, it could certainly work. And, if this idea is to be tried, the Usenet is a good place to start it. Code can be made available by uucp, so that the readers wouldn't have to type it, and distribution can be done electronically, so that the costs would be covered by the reader, for transmission time.

I am a third year Computer Science student, so my level is not up to that of many of you out there. But I am willing to try to organize/ edit such a beast, if there is sufficient interest, and there are people willing to help.

If you are interested in such a monster, as a reader, a contributor, or an editor, please send me email. My addresses are:

mccarrol@topaz.rutgers.edu (Internet, and Usenet)
<backbone>!rutgers!topaz!mccarrol (Old style Usenet)

(Not that I'm really qualified to speak, but...)

To be a developer in the general sense, all you have to do (I think) is to write something. Then find a company that'll market your product, and you're set. Antic and Michtron, it seems, look for new products this way.

To be a developer in the $300 sense means you send a check to Atari. They then make you an "official" developer, which means you get a developer's kit (with all sorts of neat detailed technical papers), and you're put on Atari's mailing list. You're then entitled to get goodies straight from Atari's innermost lairs, such as development update newsletters and early versions of new TOS ROMs B-).

I don't think the Developer's Kit comes with Megamax C. For that, you'll have to shell out $200 like the rest of us (well, I've got Laser C, but since Megamax makes that too, I consider it the same)

If I screwed anything up, will somebody tell me? These are just the impressions from a programmer on the _outside_ of the developer's "inner circle" B-).

> one of the rom chips is very HOT to the touch...

It could be the rom chip, but also make sure that none of the rom
output lines (data lines) are shorted to anything else (or together).
Shorted outputs draw a lot of current so they tend to get very warm --
but the actual short could be all the way across the pc board.

Does your *NIX box respond to XON/XOFF (DC1/DC3)? Flash, for one,
can't keep up with character input at 9600 baud, and will send an XOFF
when the buffer gets nearly full. If the *NIX box ignores it, the
buffer will overflow and characters will be lost.

Alternatively, you could enable hardware handshaking (Ready-to-send
[RTS]/Clear-to-send [CTS]), but in my own experience these don't work
properly on the Atari side. You *will* need some sort of handshaking
at 9600 baud, in any event.

No, (in my experience) no color monitor is supported.
The european version of SIGNUM works fine on 1040s.
A hard drive is not required, but you should use one, because SIGNUM makes frequent use of disk (consists of a bunch of utilities).

>
> 2. What file format/printing options? I.e. does it produce DVI output files,
> can I print to an Epson compatible, or to a postscript printer?

Output to EPSON compatible printers (9 dots) is supported, but very slow (about 15 min per page, because each line is printed 6 times). 24 dot printers would be a good guess. There also is an ATARI Laser driver included.
The .SDO file format is only compatible with SIGNUM, but ASCII imports/exports are possible.

>
> 3. Will it support graphics figures in the text?

Yes, and in VERY GOOD QUALITY !!! And you can change the size of graphics images, you can easily duplicate them, without any problems of overlapping !
Also the texts !

>
> 4. Suggested retail price in the USA? (STPlus has it advertised for $250).

Could be true, I think. The german version is DM449, that is, about $230).

>
> 5. Any major or minor limitations encountered by current/previous users?

The print speed. The printing image is very good, but it must be printed 6 times each line for max quality.

--

SIGNUM is a WYSIWYG editor, I mean what I say. Great stuff. Very quick on editing. No fatal bugs detected in the german version (tested a friend's SIGNUM over 3 Months).

Try turning off the handshake lines (xon&xoff I believe). I've heard that
this works for high baud rates.

Does the st go at 19K baud?

Mark, for the most part, that is what comp.[sys|binaries|sources].atari.st
is. Steve Grimm maintains archives at archive-server@ssyx.ucsc.edu with
binaries and sources.

What would be very nice would be in depth articles (like those for how to
reserve memory for video ram that showed up 2 weeks ago) WITH BIBLIOGRAPHY.
That way, we could go out and get further info if necessary. Just a title
and date would be sufficient.
Better code documentation would also be super helpful.

I've seen many netters refer to GEnie. I've heard of it, but am not familiar with it (I get the impression it's like CompuServe - which I have also never used). It sounds as if Genie would be useful to have access to.
Ok, here's the big question - how do I get access to it? Who do I contact? Is it expensive?

I'm trying to decide whether or not Genie would be worthwhile for me...

Thanx for your help,

Mark Frost (humtech@ucschu.ucsc.edu)

Yes, this works fine most of the time. I'm using an HP LaserJet II on my ST via the "modem" port despite the fact that the LJII has a parallel port in addition to a serial port. My early-1985-vintage 520ST can't seem to drive a LaserJet through the parallel port due to the LJ's load. Anyway, I have found certain programs (as well as the new beta-release ROMs) evidently ASSUME the printer to be attached to the parallel port even though the "printer" port has been redirected through the "modem" port through the Control Panel DA. So I cannot print a file from certain programs or the desktop with my serial printer.

[Seems as something zapped this the first time, sorry if it shows up twice]

In article <JEFF.88Sep2035059@stormy.atmos.washington.edu>
jeff@stormy.atmos.washington.edu (Jeff Bowden) writes:
>I grabbed the gcc executables a few days ago. I found that I had
>insufficient resources to run it (sob :-( ).

Gcc can be run on a 1 MB machine! You will not be able to compile any larger
files from GULAM, but you can revert to compiling from the Desktop if memory
is a problem.

To bootstrap you NEED:
a copy of gulam
a diskeditor

1) patch the executable of gcc-cc1.ttp so that only 300 kB of stack instead
of 500 kB are allocated (you can search for the value 500000, it only
occurs once, somewhere around 364kB). [That you have to do this is really
a bug, there is NO need for a GEMDOS only program, that doesn't exec
another program to give memory back to GEMDOS, I'm changing my crt0
so that it will take -1L in _stksize to mean: "Don't do a Mshrink"]

2) Now throw all resident stuff out (accessories etc. just keep GEMBOOT
or folderxxx (you do have a HD?)), start gulam and setup the enviroment
as described by jrd. You should now be able to compile most programs
(you can compile all of flex except parse.c and scan.c for an example).
This is a good time to get the sources and extract the documentation
from them, how else are you going to know about -mshort
-fomit-frame-pointer etc.?

3) If a source file is too large to be compiled from GULAM, you will get
a "no more virtual memory" message or someting like that (probably
already from gcc-cpp). You can workaround this by running the
compiler from the desktop, the current gcc.ttp will NOT work from the
desktop (reasons follow), so you will have to write a small wrapper
program to do this (I'm fixing gcc.ttp right now.....).

Note:
all gcc stuff assumes:
file-handle
0 = stdin
1 = stdout
2 = stderr
since the GEMDOS default for handle 2 is the serial
port, this isn't much good when you start stuff from
the desktop.

So you need a
Fforce(2,Fdup(1))
At the begining of your program to see any error output
(and due to a bug in stdio to see any output at all).

Trying this shows two bugs in the current runtime library:

- Fforce has a wrong binding in osbind.h,
it uses 3 short (aka 16 bit) arguments!
Write a trap-1www function to do this.
[BTW is anybody working on cleaning up
the library, there is a lot of stuff that
should be done]

- stdout uses GEMDOS handle 2 instead of 1
(I haven't actually found the location of the
bug yet, but the symptoms are (every thing
from the desktop naturally.....):

Works:

```
Fwrite(1,.....
Fforce(2,Fdup(1));
Fwrite(2,.....
```

Doesn't work (first line doesn't get output):

```
fprintf(stdout,"%s\n","Test of stdout");
Fforce(2,Fdup(1));
fprintf(stderr,"%s\n","Test of stderr");
```

Works:

```
Fforce(2,Fdup(1));
fprintf(stdout,"%s\n","Test of stdout");
fprintf(stderr,"%s\n","Test of stderr");
```

Don't get put off by this description, GNC CC is worth it!
(For the Turbo C people, there is a note in the manual about
using registers for parameter passing in future versions......)

> Any comment?

What sort of publication from HP? I know that here at Vancouver we did
a Microsoft Windows driver for the DeskJet but we never have done an ST
driver. This must be some third party driver. I will
check a bit more. I know little about PaintJet drivers (those are made
1000 miles away in San Diego) so I can't comment on that. By the way,
PaintJet is 180*180 resolution and does make nice looking output. No
idea on ST support. I gather various DeskJet drivers for both STs and
Amigas are being written or have recently been written but I don't know
a thing about them.

I'll see what I can find out.

>(~300K). I also have several other GNU utilities here:

I think I should make myself a bit more clear on the subject of source postings. In general I think posting source is a GOOD_THING, but the indiscriminate posting of none machine specfic sources is NOT. Take for an example FLEX: to get the source to compile and run on a ST takes minimal changes (change the filenames to MS-DOS compatible format, change entry to Entry for MWC 2.0 in one file, and allocate enough stack), the original sources are available from various archives (CIC for Bitnet). A resonable compromise is to distribute diffs for people that don't want to figure stuff like this out by themselves.

5438. MacPaint Header

Newsgroup: comp.sys.atari.st
Date: 1988-09-10 04:00:34 UTC
From: dmb@TIS.COM
Message-ID: <8809100400.AA01642@TIS.COM>
Source record: 250838

In the previous picture formats list I wrote that the MacPaint header
is:

1 long version number (if zero, header is ignored)
38 * 2 longs pattern data (anyone know how to use this?)
51 longs reserved

Jim McCabe has observed that MacPaint files have 160-longword headers, not
128-longword headers (as I had it). Anyone know:

A) Where the extra 32 longwords have gone?
B) How to use the pattern data?
]
There seem to be a few problems with Tiny as well. Anyone have a
good idea what has happened to the Tiny format (so that there are now
Tiny format pictures which don't meet David Mumper's original Tiny format
spec). It seems that there are some extra zeroes in the headers of these
"mutated" pictures. What's the deal?

Dave

5439. Animation Topics

Newsgroup: comp.sys.atari.st
Date: 1988-09-10 04:53:06 UTC
From: dmb@TIS.COM
Message-ID: <8809100453.AA01878@TIS.COM>
Source record: 250839

There has been a bit of talk about animation here lately; here's my
two cent's worth:

Sprite Speed Limit

Robert White asked about the time it takes to smoothly move a sprite
across the screen.
Since the vertical refresh only occurs every 1/60th of a second, it will
indeeed take about 6 seconds for a sprite to move across the screen if you
move it one pixel per page flip.
However, moving the sprite more pixels per refresh does not change the
smoothness of the animation as much as you might think. The sprites in
HacMan (a public domain game available at an archive near you :-)) move
between 2 and 8 pixels per page flip. The animation doesn't appear
jerky until about 5 pixels per page flip (Board 19, "Chris Vs. HacMan", has
the sprites moving at 4 pixels per page flip).
Also, the page flips in HacMan do not even occur every 60th of a second;
they occur every 30th of a second (the program misses every other vblank),
and the animation is still satisfactory.
The blurring effect you get when you move a sprite, say, 2 pixels every
60th of second is not flicker, it's strobing. It's just that the new image
appears before the old image has completely faded from the screen. This is
really obvious on IBM monochrome monitors, but only slightly evident on
the ST RGB monitor.

Implementing the Page Flipping

It is true that you can change the screen pointer "by hand" by changing
a location in page 4. Unfortunately this doesn't produce very nice
results (Setscreen works better than any hack I've seen).
Setscreen doesn't cause any delay at all. The call returns immediately.
However, if you change the physical screen base with Setscreen, the change
won't _take effect_ until the next vertical blank. In other words, the
code to actually set the physcial screen base is in the vertical blank
interrupt code (along with code to set the palette and the "media changed"
flag code, etc.) Thus, two succesive calls to Setscreen will frequently
only have the effect of the last call (unless a vertical blank happens to
occur between them).
So, you have to explcitly wait for the vertical blank after you call
Setscreen to be sure that the new physical base got set. E.g.,

```
Setscreen((char *) -1L, (char *) new_phys_base, -1);
Vsync();
```

Anyone interested in animation should check out the Animatic demo in the archives! (Sorry, I just couldn't resist the temptation to advertise) :-)

Hope this is useful...
Dave

5440. Help With linea8()

Newsgroup: comp.sys.atari.st
Date: 1988-09-10 16:32:07 UTC
From: dgy@sigmast.UUCP
Message-ID: <623@sigmast.UUCP>
Source record: 250840

I am trying to use Mark Williams C 3.0 to do low-level line-A calls. My routines to do lines and points work just fine, but my text routines are not working quite right. Under msh they are generally OK, but when the program is invoked from the desktop I either get invisible text or garbled characters.

Below is a skeletal version of what I am trying to do. Any help or suggestions would be greatly appreciated!

```
#include <linea.h>
struct la_font *fontp; /* Line A font header. */
char scr_wrk[1024];

setup()
{
linea0(); /* Initialize linea */
lineaa(); /* Hide mouse */
Cursconf(0, i); /* Hide cursor */

WMODE = 0; /* Writing mode = replace */
STYLE = 0; /* Normal Letters */
SRCY = 0; /* Y coord of character in font */
LITEMSK = 0x5555; /* Lightening and skewing masks for text */
SKEWMSK = 0x1111;
TEXTFG = 15; /* Text foreground dark blue */
SCRTCHP = scr_wrk; /* Scratch area for graphics */
LNMASK = -1; /* Solid lines */
WEIGHT = 1; /* Thickening factor for lines */
LSTLIN = -1;
}

writetxt(text, x, y)
char *text;
int x, y;
{
register int i;
unsigned int tmp;

fontp = la_init.li_a1[0]; /* 6x6 system font */
FBASE = fontp->font_data; /* Pointer to start of font form */
FWIDTH = fontp->font_width; /* Width of font form */
DELY = fontp->font_height; /* Height of character in font */

DSTX = x;
DSTY = y;
i = 0;
```

```
do {
if (!iscntrl(text[i])) {
tmp = text[i] - fontp->font_low_ade;
DELX = fontp->font_char_off[tmp + 1] -
(SRCX = fontp->font_char_off[tmp]);
linea8();
}
} while (text[++i] != '\0');
}
```

well... I've been using both gulam and Uniterm at 9600 and 19200 baud when transferring files between UNIX and ST, and I rarely get errors. If you have either of these, then give them a try.

Maybe if you tried expanding your serial I/O buffers, that might help.

>comp.binaries.etc. newsgroups. My question (and problem) is: How do I
>take advantage of these files? Is there a specific program I need to use
>these programs, and where could I obtain it?

It kind of depends on whether you are on a Unix system or not. If
pacsbb is a Unix box, then just use the uudecode command (standard on
most Unix systems.) Most versions of uudecode require that the input
file be in one piece, so if you get a multipart file, you will
sometimes have to cat the files together and then go in and remove
the header information between the uudecode'ed blocks. Another
approach is to move the comp.binaries.etc files over to the ST first
and run Dumas's uud software (available on my BBS's worldwide). This
software is set up so you don't have to concatenate the files first
(iff the original multi-part file was encoded with Dumas's software).
I generally prefer to uudecode everything on the Unix system, since
that is faster...1) the uudecode runs faster, 2) the files are smaller
by 50% after uudecoding, and 3) I can un-arc the files on the Unix box
and see if I still want the program after reading the docs.

In answer to a previous post about hdscan...I am guessing that you
either need the dumas software (i.e. you don't have a Unix system to
uudecode it on), or you are on a Unix system and didn't realize you
have to concatenate the files. I think I did that one in three parts
and they did uudecode OK here after they came back through the
binaries group.

-Todd Burkey "A member of STdNET-The ST developers' Network"
trb@stag.UUCP -> to join, mail to ftg!dwm@stag.UUCP <-
P.S.:
I just remembered that at one time I had the dumas software running
on my Unix system, so the sources are probably floating around, too.

5448. GEnie again...

Thanx to the many people who responded to my request for info about gettint GEnie. What I'd really like to know, however, is how valuable is GEnie? What do I get other than some files to download and maybe a little mail? I can ftp from just about to just about any archive sites, so downloading software isn't a big concern (unless the stuff on GEnie is unique). I can also send mail to just about anyone who gets e-mail. So what does GEnie offer me that I don't already have. Also a lot of GEnie info (I take it) is forwarded to UseNet by readers of GEnie anyway.

For those of you who do get GEnie, how valuable is it to you? I'd like to know users opinions before I try to sign up because as I understand it I don't get an evaluation period to decide whether it's really useful or not.

Thanx again

GEnie is General Electric Network for Information Exchange, and yes, it's much like CI$ in the fact that it has software libraries and a bulletin board area. (Obviously, the system software is different, however.)

GEnie is $5 an hour during non-primetime (6PM to 8AM I believe) for 300/1200 baud. For 2400 baud, it gets expensive. There is a signup fee of about $30 which includes a spiral bound manual on getting around GEnie. There are usually deals that can be found to signon without the fee. Atari has one, but I don't know the access code to use offhand. Perhaps someone else can supply it. Intersect also offers one, I believe. (I believe you do not get the manual in these cases either.)

Client Services (real people) can be reached at 800-638-9636. They can give you information on local access numbers and signing up.

There already exists such a magazine (for almost 3 years yet!). It is called 'The Amigan Apprentice and Journeyman'
It is published 6 times a year out of Hatteras NC. Dick Barnes edits it (and does a darn good job at it) from contributions from all over. I write a regular C column in it while Bill Hawes (of Conman and ARexx fame) does an Assembly column.

Than magazine accepts no advertisements and does not pay authors. It is printed on 3 hole punch paper so that you can build a reference guide out of it. Additionally it gets an index once a year as part of the issue to allow you to locate articles quickly. Unlike other Amiga magazines, it is possible to sit down and read it completely from cover to cover.

For those interested, the address is:
The Amigans
Box 411
Hatteras, NC 27943
Rate is $24.00 a year.

Plus - they are ALWAYS looking for good articles.

Wade writes:
Hmmm...

I used to program in PASCAL alot. In fact, while I was at UCSD, this
was the only upper level language used in the C.S. dept. Had to write an
Ada compiler in Berkley PACAL :^(.

What is wrong with useing a simple function to concat your two
strings There are many string manipulation funtions provided in Benchmark
Modula-2, and it is easy enough to deal with these things without them anyway.

The problem with using the "+" operator to concatinate strings is that
it genrates sloppy code, which is why it is not a part of modern languages.
It was one of many things included in PASCAL to make teaching programming
easier, but has no place in proffesional code. What happens when you
concatinate two strings and the destination is too short to hold the result?

I do not agree with your notion that using a '+' to concat two strings
causes 'sloppy' code. Such an allowance is called 'overloading' which
is a concept availabe on most modern object oriented programming languages
such as Ada and C++. The purpose of overloading is to enhance the
readability of code by hiding as much unnecessary information as possible.
I am surprised that after having written an Ada compiler, you never came
across overloading...

Yes, I tried to use Signum II on a UK machine. The R/E you found is caused by dirty direct-TOS-accesses of SIGNUM (especially the Editor (and its fast scrolling) using seperate pure code routines (AES would be too slow)). So, the only way is to boot the german RAM TOS from a system disk. But then, it works fine, as I can say on my experiences. The only problem : you must also use a german keyboard layout, because SIGMUN is working with scan codes, that is, because of some triple-defined keys (ALT, CTRL). But if they sell the SIGNUM II package in U.S., it will run also on U.S. ROMs and U.S. keyboards, of course.

5456. Memory Allocator - who wants it?

Newsgroup: comp.sys.atari.st
Date: 1988-09-12 12:24:45 UTC
From: achowe@watmsg.waterloo.edu
Message-ID: <20813@watmath.waterloo.edu>
Source record: 250755

As a recent exercise I have written my own memory allocator to be used
with another project at the moment. It is designed to request heaps of
64k from the system (configurable) and then partion that up even further
as request come in. Garbage collection is done on the heaps so that when
a entire 64k heap is freed that is then returned to the system.
No garbage collection is done on the partioning level.

Overhead for an allocated cell is on 2 bytes (the size of the request).
I used unsigned int (Acylon) for the storage type. The code code be
altered to use unsigned long if I get gcc soon. This will alter the
system heap limit of 64k.

So anyone want a copy? Also how to (who to) send it to for posting to
atari.source?

NOTE that use of this allocator requires that people use the memory
allocated correctly!!!! None of this off-by-one errors that write just
outside of allocated request (al-la Malloc compatiblity problem).

Also for anyone who wishes to try this on their own have a look at Knuth
and the source provided for a malloc in K&R C Programming Language
first edition for a simple example. My method is similar.

| I've seen many netters refer to GEnie. I've heard of it, but am not
| familiar with it (I get the impression it's like CompuServe - which I
| have also never used). It sounds as if Genie would be useful to have
| access to.
| Ok, here's the big question - how do I get access to it? Who do I
| contact? Is it expensive?

Yes and no and yes and no.

I don't have exact figures handy, so you'll have to bear with my
impressions and memory.
I believe it's about $15 to start. For that you get an account and
a handbook on how to use the system. The question is, what will yo
use the system for? The mailer is the single worst piece of garbage
called software I've ever had the displeasure of using. Every time
I use it, I am inspired to flame the sysop.
The software uploaded by users is really great. This is the reason to
join GEnie, for me.

It seems to cost a lot- they take it directly from my account. You are
charged by the minute, and although they claim they don't charge for
download time, they do (I haven't bothered to fight this one yet- I am simply
giving up...). Finally, you really have to kick and scream
to get an explanation for billing. They much prefer to silently pull
from your account :-(.

Contact Atari over the hill about GEnie. I got in on an introductory
offer that waived the $15 fee (but I got no handbook :-( ) that was
offered to Atari users.

Contact me at ucscc!sco!sethk for details.

I've been hearing this "dying computer" attitude from dealers, distributors, and even some magazine publishers (always the last to go) for several months, but I've been reluctant to say anything because I feared it would be construed as nothing more than an attempted stab at Atari. It isn't. It truly appears that Atari has played out their last hand. According to reports from dealers and distributors sales have fallen dramatically. Personally BDT sales of Atari products have dropped to 1/5 the size of 18 months ago (this is partially attributed to a major de-emphasis of the Atari product line by the company) and today Atari product sales represent less than 20% of BDT revenues.

BDT revenues from other areas are now financing Atari customer support. We will continue to support our Atari customers. But how many other companies have alternate sources of revenue upon which to fund Atari support? I bet not very many. So what's going to happen? What about the end-user? I think the consumer who paid hard-earned money in hopes of obtaining a useful computer system is the big loser here, especially those that have invested lots of hardware, money, and time on the ST.

I guess in all this rambling one thing I'm trying to say is that all of us invested in Atari. Now what are they going to do for us? A long slow death is the worst for everyone, including the stock-holders.

It seems to me that this should be a lot more troubesome to all of us than whether or not they have fixed the Malloc bug.

>By the way, my name on genie is n.kline.

I think these are representative of the problem. Atari says don't
complain in public or we'll sue you, yet when you attempt to employ the
"official" methods , you get no results.

While I certainly believe that it is inappropriate (and usually illegal)
to "advertise" bugs in Beta releases, I also understand the frustrations of
those that have felt compelled to "go forward" with thir views.

As an exmple, I recently received the developers newsletter from Atari.
It has a form regarding Fall Comdex that says it must be returned to
Atari by Sept 1 to be considered; it is postmarked Sept 1 and I received
it on Sept 7! It's still a good sign that they sent the newletter out.

It is not unique to Atari either, I'm an official beta tester for Microport
and I have been struggling with numerous bugs in the Beta release. I'm
tearing my hair out because Microport hasn't done anything about it
and I can't post the problems to get help either.

Microport has so many problems their users are considereing legal action
against them for "bad faith". I wonder if we might be able to build
such a case against Atari?

Perhaps others are interested too, so I'm posting this to help clear it up.
MT C-Shell V1.10 or higher and Micro C-Shell 2.70 and higher pass arguments
and environment variables using the "standard" established by Mark Williams
Company's Micro Shell (msh) and compiler libraries. MT C-Shell does *not*
convert the arguments to uppercase. Some C-runtime utilities (namely the
one Atari shipped to developers) converts arguments to *lower* case before
placing them in argv[].

The MWC argument/environment passing method is documented in their manual.
If anyone is interested in the format and cannot obtain by other means,
contact me and I will send you some info.

After sending in my registration card for Personal Pascal, it was
returned by the post office stateing "MOVED, LEFT NO ADDRESS".
I heard that OSS merged with or was absorbed by another company. Will
this company be supporting OSS products. Can I register my copy
with them? Does anyone have an address to contact? Help!

There's another one too, and this is it! Usenet is certianly user supported and produced. It's nearly real-time too! I has better content than the magazines everyone has been complaining about too.

5469. CONNECT YOUR OWN HARD DISK + ONE QUESTION

Newsgroup: comp.sys.atari.st
Date: 1988-09-13 09:45:29 UTC
From: remco@tnoibbc.UUCP
Message-ID: <828@tnoibbc.UUCP>
Source record: 250768

Hello ATARI-lovers: Here are some answers and one question about hard disks.

I connected a CMI 5619 harddisk (16MB) to my 1040ST via a XEBEC S1410
controller and an ATARI host adapter board. The software I used
is: icdfmt.prg from ICD (a *VERY* nice program which may be distributed
freely) and icdboot.prg as a diskdriver.

The problem is: when I try to format a second hard disk (logical unit
number = 1 instead of 0, which is the first HD), the disk starts
formatting but when the last track is done, the formatting process
starts all over again, so partitioning is not done.
I *can* format the second disk when I strap it to be LUN=0, but I
still cannot access the disk as a second hard disk from the desktop.

Question: Is this a software problem or does it have something to
do with the ATARI host adapter board ?

Finally: anyone who is interested in how I got the first HD to work
(I also got a RODIME 204E (44MB) and a seagate ... (40MB) running)
please let me know and I can see if I can help.

Thanks in advance for your (hopefully numerous) answers.

Cross-posted to: comp.sys.atari.st,comp.os.minix

Has anyone seen sources for STEVIE (a vi-clone)?
I do not know if sources have been posted or are otherwise available.
I have used version 2.13 for some time on my atari, but do not
like its occasional crashes.
Adding a "log" of typed characters may help me
to recover the text that is lost after STEVIE has died.

Please email your address if you are willing to send the sources.

Thanks in advance.

in article <8809120250.AA29256@ucbvax.Berkeley.EDU>, BHOLMES@WAYNEST1.BITNET (Brian Holmes) says:
> I have heard about ethernet boards that connect to a MAC via the
> RS232 port, so the hardware is out there. It would just be a matter
> of writing the software to run it on an ST. I don't know very much
> about apple talk, but could you then tie a machine on ethernet into
> appletalk?

There are a couple (at least) of products out that allow you to connect an AppleTalk Network to Ethernet. If you did have an AppleTalk compatible port on the ST you could then hook it to Ethernet. Of course the ST doesn't have an AppleTalk compatible port. Apple used a Zilog SCC chip that can be run at rates as high as 1 Mega bit per second. In the Mac it is limited to about 300K bit per second data rates due to the hardware design (low clock speed and no DMA to/from the chip). AppleTalk is run at about 230K bits per second (I don't remember the exact figure). Unfortunately the ports on the ST are limited to low speeds, 19.2K baud for the serial port and 32K baud for the MIDI ports. So either you have to modify the ST serial hardware to support higher speeds or you have to add additional hardware with an AppleTalk compatible port. If you want Ethernet it is probably going to be cheaper to design something to run off the DMA bus instead of going through an AppleTalk to DMA converter.

5472. Boycott Apple Again

Newsgroup: comp.sys.atari.st
Date: 1988-09-13 15:25:27 UTC
From: daniel@island.uu.net
Message-ID: <358@island.uu.net>
Source record: 250771
Cross-posted to: comp.sys.ibm.pc,comp.sys.mac,comp.sys.amiga,comp.sys.atari.st

A while back, when Apple decided to sue Microsoft and HP, I made
a posting with the subject "Boycott Apple". Now they've done something
that's very likely to upset a lot of people again...

They raised prices...not just a little bit, but substantially:

old new change
Mac II 3769 4869 29.1%
Mac SE 2769 3169 14.4%
Mac Plus 1799 1799 -
IIgs 999 1149 15.0%
IIgs mem exp 129 229 77.5%

I thought this was an industry where prices kept going down, and
features kept going up. On top of that, Apple is supposed to release
a new Mac on Monday. How much is *that* going to be?

In between IBM's bumbling of just about everything in sight (it's
going to be an MCA future, but wait! here's a new AT!), Apple's greed,
Atari's sort-of-ok acceptance, and Commodore shooting themselves in the
foot, the calf, the knee, etc, with mismarketing the Amiga, I just
don't know...I think I'll save up for a Sun ;-)

Message-ID: <8809131711.AA02054@ucbvax.Berkeley.EDU>
Source record: 250772

Dear Atari users,

A friend from the "Southern Belgium Fig Chapter" would like to make
an improvement to the version for the Atari ST of our Forth system.
For this, he needs know how to obtain the current cursor position on
the screen of a GEMDOS program whose filetype is .TOS or .TTP.
He has tried the VT52 cursor position report ESC n which did not work.
The method should of course not use any unreliable absolute address.

Please reply me personally, as I am not on the list.

BTW, anyone interested in this very useful and friendly Forth system
may drop me a line.

Thanks in advance.

AndrQ.

5474. Re: Genie?

I'm posting to clear up some possible misconceptions. I have no connection with GEnie, other than being a fairly satisfied customer.

As has been posted before, GEnie charges $5/hr for non-prime-time usage at 1200 bps. Prime-time usage (8 AM to 6 PM local time) is prohibitively expensive, at around $35/hr (I don't have this figure since it's so ridiculous). 2400 bps is $13.50 non-prime-time. On-line time is measured in minutes and seconds.

Charges are billed directly to a credit card or through a checking account debit service. Billing information for the past month (including on-line time on a daily basis) is available from a menu selection.

Downloads (from GEnie to your computer) are charged normally. Uploads (from your computer to GEnie) are free. Download protocols include text, XMODEM, 1K XMODEM, and YMODEM. Upload protocols include text, XMODEM, and XMODEM CRC.

I don't like the editor, either, so I edit off-line and upload messages. Straight text message upload is supported.

>giving up...).

Actually, they do charge for download time (Genie -> You) but they
don't charge for upload time - you are not penalized for donating software.

I haven't used the mail since most of the people I want to talk to
are on this network, but I have downloaded a fair amount of software and
much of it is good. There are also some machine specific discussions that
are pretty good. Best of all, is that there isn't an extra charge for
1200 baud (but there is one for 2400 baud), and there isn't a minimum charge.
When you decide to drop out for a month or so, you don't have to pay anyway.

Compuserve's connect charge is at least $12.50/hr for connect time
at 1200 baud - more than double what Genie costs. (Off hours that is). From
what I've heard, the software is about the same, Atari seems to be stronger
on Genie, but Mac is stronger on Compuserve, and all of the other services -
well I don't bother using them.

Contact each and compare -

> they claim they don't charge for
> download time, ...

No, they claim they don't charge for UPLOAD time. That's when you GIVE THEM software. Download time (when you get software FROM THEM) is charged at the normal rate ($5/hr). Also, noncommercial GEnie subscribers can only call after 5PM local time and on weekends: the rest of the day is for GE's commercial customers, who are the primary consumers of that whole computer setup.

GEnie has 2400-baud access at a higher hourly rate (I don't know how much higher) but, of course, 2400 baud cuts your download time in half. I would recommend using 1200 baud for interactive online time; log out and call up again at 2400 baud just for downloads.

On the other hand, I've never paid for GEnie or used 2400 baud: I have a free account because I'm with a "provider" (Atari) and free accounts aren't allowed to call up at 2400. Don't get mad: if your company brings GEnie as much business as Atari does, you can get free online time, too.

>of BDT revenues.
>
Sorry that sales have been bad David, but what's the point?
Atari has never really pushed the ST line, and they don't
advertise, so what's changed (are your products dropping in
sales for some other reason?) If your sales from Atari Prods are
20% of revenue now, and they are 1/5 the size of 18 months
prior, does that mean 18 months ago they were 100% of your
revenue?? ISN'T THAT GOOD?? This means you're selling MORE
than Atari Products, and becoming a MORE DIVERSE, BETTER
COMPANY!!!

YES the lack of exciting PR news from Atari causes the market
to become depressed, but that's MUCH better than Atari just
talking and not releasing. In fact, hasn't Roy Good been
hinting about something new (Razzle Dazzle) on the
horizon? Something that you'd like to "Stay Tuned" for?

>BDT revenues from other areas are now financing Atari customer support. We
>will continue to support our Atari customers. But how many other companies
>have alternate sources of revenue upon which to fund Atari support? I
>bet not very many. So what's going to happen? What about the end-user?
>I think the consumer who paid hard-earned money in hopes of obtaining
>a useful computer system is the big loser here, especially those that
>have invested lots of hardware, money, and time on the ST.
>
The "consumer who paid hard-earned money" for his Atari system
is NOT a loser, he (or she) gets an excellent piece of hardware that
has a huge base of software (PD & commercial), and DOESN'T depend on
Atari for day-to-day support anyway -- just because Atari doesn't

advertise, and isn't pushing the ST line DOESN'T mean that the ST
suddenly becomes a changed machine.

Personally, I think the user who pays too much and uses his
machine for too little is a big loser, and I certainly can't
say that for ANY Atari owners I know.

>I guess in all this rambling one thing I'm trying to say is that all
>of us invested in Atari. Now what are they going to do for us? A
>long slow death is the worst for everyone, including the stock-holders.
>
"What are they going to do for us?" That's a terrible attitude!
Don't you think that YOU make a contribution to the welfare
of Atari also, and that by posting disparaging remarks just
ADDS to the DECLINE in your sales???

>It seems to me that this should be a lot more troubesome to all of us
>than whether or not they have fixed the Malloc bug.
>--
Fine, but why gripe when you can be holding constructive,
educational conversations (ex: learning about animation
techniques, and working with the system in new, neat ways).

Many ideas for new products, and implementations of many
good concepts have been given life through the net, don't
abuse it by bitching.

From: gibson@trwrb.UUCP
Message-ID: <7896@trwrb.UUCP>
Source record: 250779

I have the media change bug on my Mega 2. (The escape key does not always update the drive A directory when write protection is enabled).

My Mega 2 is still under warranty. I am having trouble getting it repaired. Although my dealer was not aware of the problem, he replaced by drive. However, I still have the problem.
Who can my dealer talk to at Atari to get information on the media change bug? My dealer claims he talked to Atari without success. . Although my dealer is an authorized Atari dealer, he is not a knowledgeable dealer.

What is the fix for the media change bug? I thought replacing the drive would fix the media change bug.

*in minutes and seconds.

Last I checked, the surcharge for 2400 was $7.50 for a total of $12.50 -- it may have gone up since I rarely use 2400. This is one of my few complaints with GEnie: it costs MORE than twice as much to not-quite double your throughput. I can live with this, though, since at 1200 GEnie is the cheapest service going. Also, I think billing is rounded to the nearest hundredth of a minute, don't ask me why. As for prime-time, who needs it except the businessmen getting stock quotes? (:

*Downloads (from GEnie to your computer) are charged normally. Uploads (from
*your computer to GEnie) are free. Download protocols include text, XMODEM,
*1K XMODEM, and YMODEM. Upload protocols include text, XMODEM, and XMODEM CRC.

YMODEM support now includes YMODEM-G, if you have Microphone II.

I really enjoy GEnie a great deal. The software libraries seem well-stocked, and the special-interest roundtables are a lot more fun knowing they're only about 8 cents a minute. In fact, there's a new deal LOWERING the price of one of their most popular items: the CB simulator -- you can now sign up for unlimited use of the CB for $50/month. There really are some interesting folks on it, and I know of two CBers who are now engaged!

Disclaimer: I don't work for GEnie, I'm just a satisfied CB addict.

James

Well this is a free country, I never signed a contract I wouldn't tell, I'm not a registered developer, after all this net is for Atari info.!

This weekend I met up with someone who had TOS 1.4 (I don't no how he got it, or even his name(I was more interestead in the ROM info.)). He said that it has some nice features. He said now when you copy files, instead of just displaying how many files to go, it also displays the names of the files. He said disk I/O is increased "umpteen times" (that's a direct quote). He said he hadn't fooled around much with its internals and didn't know about internal error corrections such as malloc. He really didn't say much else but that it seemed to have many new *niceties* such as the file names being displayed as they are copied. I was in somewhat of a hurry and couldn't ask him detailed questions, he also was very anxious to offer info., but he seemed as if he hadn't worked much with it or didn't want to offer details. <<<<<<<<<<<Remember this is information from someone I don't really know, but it should be reliable..

If I remember correctly, ICD bought out OSS. And knowing ICD, they'll support OSS' stuff. Unfortunately, I don't have the address, anyone care to post it?

John

>
Originally, I flamed David for his negative articles. Now I believe
he has a point. The computer store I work at during breaks has dropped ST
hardware. I'm hearing a lot of the same negative feelings that Dave is.
However, in the last month I've started hearing more good news. I'm seeing
more new products and hearing more optimistic reports on Atari products and
Atari's future. Some dealers are doing poorly, others are doing very well.
Overall, I think Atari was dying. Now they've stablised, but they still
have a long road to recovery. I don't think the ST will ever replace MS-DOS
or the Mac, but it still may have a viable future.

> sales for some other reason?)

As more and more time goes by without the push, more people begin to
doubt the future of the ST. This means new products aren't developed which
makes more people doubt the future of the ST, etc. It's that little
has changed which is the problem.
>
> YES the lack of exciting PR news from Atari causes the market
> to become depressed, but that's MUCH better than Atari just
> talking and not releasing.

This is damning with faint praise. Not only does Atari need to stop
making announcements too far in advance, they also need to release new products,
especially those they have been talking about for so long.

>In fact, hasn't Roy Good been
> hinting about something new (Razzle Dazzle) on the
> horizon? Something that you'd like to "Stay Tuned" for?
>
Unfortunately Neil Harris was also hinting about something new on the
horizon. I would love to see all the good things Roy's talking about, I hope
I will see them, most of the time I think I will see them. But until I can walk
into a store and buy them, they're just talk.

> The "consumer who paid hard-earned money" for his Atari system

> Atari for day-to-day support anyway -- just because Atari doesn't
> advertise, and isn't pushing the ST line DOESN'T mean that the ST
> suddenly becomes a changed machine.

Unfortunately it does become a changed machine. It changes from a
promising new machine with lots of potential for growth to one which is
withering on the vine. Most people want a computer that will be able to take
advantage of tomorrow's new developments. A computer which will did task A
a year ago, does task B today, and will do task C tommorrow is a different
machine than one that does task A today and might do task B tomorrow.

A company's support is important to user's and developer's (and
developer support is important to users). A company's support gives user's
the confidence to buy the machine. This, along with company support, encourages

developer support of the machine. Develper support give's the user even more confidence to buy the machine, which encourages more developer support. Either way, a good cycle or a bad cycle begins with the manufacturer.
>

> ADDS to the DECLINE in your sales???
>
What's so terrible about this? Isn't it usual to expect a company to help the customer, whether he be a user or a developer. I'm sure David is aware that negative comments may affect sales. However, in the long run, being honest about a company's problems as well as it's strengths makes your opinion worth hearing. Ignoring the problems won't make them go away. Support has to work both ways.

>>--

There's room on the net for both, and David has provided both help and criticism. Pointing out problems in the hope of prompting a solution is not "bitching."

> Setscreen doesn't cause any delay at all. The call returns immediately.

Yes, unless it also sets the resolution; then it will wait for a VBL.

>However, if you change the physical screen base with Setscreen, the change
>won't _take effect_ until the next vertical blank. In other words, the

No. The physical screen base *IS* set immediately by Setscreen (by storing
values at 0xff????), as is the logical screen. If you want to have the
phys. screen address changed whilst in the VBL you have to set a long in
the system variables (not the logical base, of course), because the code to
set the physical screen is there (like you said). Or add a VBL routine
that does something similar (not very productive).

I don't know what the official documentation says about the subject, but
both the RAM TOS and the old ROMs behave in the manner I just described.
I quote myself (part of an article, I believe even the same subject).

------------------------------ S t a r t s h e r e ------------------------
I've got a copy of the book '3D Grafik Programmierung' from Data Becker.
It suggests that SETSCREEN swaps at vbl time. ***THIS IS NOT TRUE!!!***
(maybe you got the same impression). SETSCREEN does not wait for vbl
to set the screen(s); only if you also change the resolution it will wait
for vbl.
There's another 'know-it' about vbl:
You *CAN* set the screen at vbl time; this however sets logical and
physical screen to the same value (not suitable for your application).
The way to do this is: enter the new screen base into the system
variable screenpt ($45e). At vbl time the screens will be set then (I
think you have to refill it with 0 to avoid having it set all the
time).
------------------------------ E n d s h e r e ------------------------

If you want to use the vbl screen change, the way to go seems:
1) set screenpt to your new screen value.
2) wait for a vertical blank (either by the XBIOS call or by checking
for instance the logical base pointer against the new screen value).
3) enter 0 into screenpt to avoid having screens set at the next vbl.
4) set the logical base pointer to the correct value (it has been
changed by the vbl).

Leo.

AstroCal is a quite interesting program although the speed is
more than boring. If the new version is really five times
faster as you announce it might get into a usable state. But
before you post it: Please add a feature to write the output on
a file!

I enjoyed this program. It sent me right away to the library to
find a map detailed enough to give me my coordinates to one one
hundredth of a degree.

Sure, I would be interested!

Thanks, Eric.

ICD did buy out OSS and merge their products together. They are supporting
both the 8bit and ST line of exOSS products. Their address is:

ICD, Inc.
1220 Rock St.
Rockford, IL 61101

ICD puts out a very nice catalog describing all their products and you can
get a free copy by writing or calling their order number (815)-968-2228.
This number is also their technical support number and is in operation
Monday - Friday, 8AM to 5PM CDT.

You can also request a catalog via their BBS if you want (that is how I got
mine) and they have an excellent SIG called ASK ICD where one of the sysops
is pretty quick at coming back with an informed answer. The BBS is 24 hr/
7 days and the number is (815)-968-2229. Baud rate is 300 - 9600.

Hope this helps...

WARNING! My responses have only good things to say about the ST, so
you Atari Haters (either the machine or the company) out there may
wish to hit the 'n' key now...

In article <379@bdt.UUCP> david@bdt.UUCP (David Beckemeyer) writes:
>I've been hearing this "dying computer" attitude from dealers, distributors,
>and even some magazine publishers (always the last to go) for several months,
>but I've been reluctant to say anything because I feared it would be construed
>as nothing more than an attempted stab at Atari. It isn't. It truly
>appears that Atari has played out their last hand.

And it could simply be that 1) May-September is a horrible selling
time for computers and software anyway, 2) a lot of people are playing
a wait-and-see game on things like the 68030 machine (or a drop in
price in RAM which may drop the price of the Mega...), and 3) there is
so much GOOD PD/Shareware software for the ST that it may really
appear to be a dying computer from the point of view of a software
developer trying to make a living off of the computer.

>I think the consumer who paid hard-earned money in hopes of obtaining
>a useful computer system is the big loser here, especially those that
>have invested lots of hardware, money, and time on the ST.

Fooey. I've wasted more money on IBM PC's and Mac's than I ever could
on my ST (or Amiga for that matter). A lot of us, early on, put $3000 plus
into an IBM PC that within years was worth less than $800. I also
bought a Mac that became worthless at an even more alarming rate as
Apple nickle and dimed me with their upgrades (128K->512K->???
actually cost more than the original Mac ($1900). The IBM PC lost its
appeal with its 64K limitations and the increasingly buggy software
that started coming out from companies like Borland, Microsoft, etc
(it almost seemed to be becoming a fad as to who could rush out their
product first and still get away with supplying the user with the most
bugs). And the Mac was just too slow and messy to develop code on (and
still be able to remember how to write code on Unix systems).

From the home user point of view, I still think the ST is best, since
it is cheap, has great games :-), has better quality PD software in
most areas than the IBM PC or the MAC, can integrate better with
'other' disk formats (and OS's) that the users may be using at work,
and is very easy for the novice user to 'learn' to program on (via
fast but simple languages like GFA Basic.) Note I haven't said
anything 'nasty' about the Amiga...I like the Amiga, but it was always
just a little behind (about 6 months to a year) the ST in the areas
I was interested in (languages, ports of PD packages, certain games,
etc). Plus when I got rid of the Amiga, I still had to deal with

having to have three OS's within reach depending upon which game or application I wanted to run...which I hear isn't a problem any more.

>It seems to me that this should be a lot more troubesome to all of us >than whether or not they have fixed the Malloc bug.

I agree, specially since I have never really seen how the 'Malloc' bug has really prevented me from doing anything on the ST as a developer. I have never lost any sleep over it or even seen the problem when using MWC. I actually have wasted more time in the other mundane bugs (like having to put character eater loops into my code to handle users that like to hold a scroll key down...else bconin bombed).

Just a theory, but maybe the "dying computer" paranoia(?) was brought about by Atari's transition from "announce it as soon as we make it" to "no announcements before its time"? There would be a dead period, where no new products are being announced and all of the old promises are still fresh in our memories -- Maybe this caused the "dying" fears...

>Overall, I think Atari was dying. Now they've stablised, but they still
>have a long road to recovery.

Funny, I never thought Atari was "dying" (at least post-Tramiel B-). A period of inactivity, yes, but not dying. But then, I'm looking at things from an end-user point of view. In fact, it seems like things are starting to get more exciting -- The laptop ST, the Epson/Postscript emulators for the Laser, the CD-ROM... But where's the ABAQ and Atari-UNIX? B-)

> I don't think the ST will ever replace MS-DOS
>or the Mac, but it still may have a viable future.

Who knows? A little luck, a lot of PR, and a miracle may happen B-). Heck, if a bunch of PC-clone-makers can challenge IBM's PC standard, why not Atari?

What about the other way 'round? Given a WORM drive (I guess one could be connected to the SCSI interface) can one write a CD which will play on an audio machine? I wouldn't mind archiving some of my old 45's. I know they would still sound like an old 45, but at least they wouldn't get damaged any further.

The problem that you are having might be caused by the Xebec 1410 controller. The 1410 only handles two drives with the same parameters, i.e. heads, cylinders, seek rate, and etc.. This is not the case with the Adaptec ACB-4000 controller which will handle two different hard drives. Also I might add the Adaptec is faster with its 1:1 interleave than the Xebec's 1:3. The Atari host adapter could also be your problem. Atari host adapters do not pass back SCSI/SASI status(error) codes properly. This causes hard disk boot software to install "phantom" drives on the system. To get around this problem ICD's software only installs one hard drive on Atari host adpaters. I hope this helps you and other people on the net.

We have received numerous Usenet letters to us in the last months, but do to one thing or another I seem to get most of my mail sent back. If you need some information from us please send us a postcard. Do to our move (yeah!!) we have a P.O. box for correspondence.

I don't know where this "The ST is a dying computer" bull is coming from, but it certainly isn't the case around here. Our ST sales are as brisk as ever, hampered only by the fact that we can't get enough 1040's to meet the demand!

David Beckemeyer claims that ST sales are now only 20% of BDT's business. I submit that that's because, powerful as they are, BDT's products are a pain in the gluteus maximus to use. I mean, we're talking about a machine with a windows-mouse-icons interface here. Most ST buyers are looking for programs that DON'T require a command-line interface or a lot of manual-reading to use. Yeah, I know that's not the case with a lot of the ST users on the net, but we AREN'T typical ST users. I sell the things; I see who buys them. And I have to teach these people things you'd think your average cocker spaniel would intuitively grasp, day in and day out.

Atari has found their market. The great silent majority. The same folks who voted for Reagan, read The Enquirer, and made The Gong Show a hit. There's a lot of them out there...

(Sorry if I sound bitter, I just get tired of working with the brain-dead.)

How does one go about writing a GEM program that will accept arguments to main via argc and argv? I'm using Mark Williams C and when I try to use argc and argv with a GEM program the program bombs.

Thanks for any help,
Jim Cochrane

5505. IBM Disk Interchange Problems

Newsgroup: comp.sys.atari.st
Date: 1988-09-14 23:07:53 UTC
From: schuster@dasys1.UUCP
Message-ID: <6455@dasys1.UUCP>
Source record: 250705

Anyone want to take a stab at this perplexing hardware problem?

HARDWARE:
-520ST with 1MB upgrade.
-A: drive - original double-sided SF314 (Epson mechanism).
-B: drive - TEAC FD55BV 40-track 5.25" (IB Drive)
-Compaq 386 clone with 720K/1.44M 3.5" drive
-Both Atari disk drives run at 300 rpm (+/- 0.5) and seem to be in good alignment as evidenced by easy interchangeability of disks with other Atari users, even with extended disk formats. The PC drive has no trouble with inerchange of even 1.44 MB disks with other AT users.

SOFTWARE:
-pc-ditto configured for 3.5" A: drive and 5.25" B: drive; name your DOS.
-TOS, 4/22/87 version, with verified pokes applied to change drive B: step rate to 6 ms (I've tried it with 12, too).

SYMPTOMS:
-5.25" B: drive works fine for minutes to an hour or so, depending on degree of activity. Suddenly it refuses to read or write reliably; DOS reports "drive not ready"; TOS reports "the data on drive B: may be damaged". Has happened during disk copy operations, so I can verify it's affected both inner and outer disk tracks on the first sign of trouble.
-3.5" A: drive works _perfectly_ in Atari mode. However, if the Atari writes to an PC-formatted disk past track 65 or so, a PC then has trouble reading the disk past that point. The Atari has _no trouble_ reading all 80 tracks of a disk formatted on the PC, but once it writes to that disk past track ~65, the PC can no longer read it.

WHAT I'VE TRIED:
-Swapped cables: Oh, come on. You have to ask?
-Clean the heads: Yes, and inspected them with a mirror to be sure.
-Tried the IB drive on someone else's Atari: Cannot reproduce the 5.25" problem, even after hours of testing.
-Tried the IB drive mechanism on my PC: Yep, it works 100%
-Tried the Epson 3.5" mechanism on my PC: Yep, that works too.
-Tried a different 3.5" drive on the Atari: Well, my original B: drive is another SF314. Same problem, same starting track #.
-Looked for thermal problems: Nothing gets especially hot. Yet, the time-related start of this 5.25" stuff sure makes me THINK something is overheating.

WHAT I SUSPECT:
I know the Atari disk controller setup is a total kludge, what with unbuffered select lines coming off a SOUND CHIP and all. It sure

sounds to me like it's a wee bit flaky but I have no way to test it.
I've also hear things about write precompensation on diskette drives
too, and wonder if the track 65 stuff might have something to do with
that. Any of you disk drive mavens care to lend a hand? Thanks!

It is a pity that there is not a bigger push in marketing the
ST's and MEGA's as OFFICE machines !

I have an XT (clone) in my office, a 1040ST and a second 1040 at
home. I NEVER turn on the XT anymore. The ST is BETTER SUITED TO
MY USES! I use it as a workstation on a SUN 3/280- with the ST I
can use the best comm pgm I have ever found (UNITERM- pd), I can
compile C, FORTRAN, or PASCAL, spreadsheets, wordprocessing....
just like a MAC+ or XT but faster!

In fact with the release of SPECTRE 128 I expect to not only
beat a MAC+ in performance BUT WHILE RUNNING MAC SOFTWARE!!

IS THIS VALUE OR WHAT!

Others in my office opted for MAC+- you
should hear their complaints about memory shortage when trying
to use a WORDperfect, etc.

Say what you will about atari or the ST it is the best buy I
could find! Knowing what I do about my ST - if I heard atari
would close shop tomorrow I would rush to a dealer today because
the 1040ST DOES SO MUCH FOR THE PRICE!!!!!!!

<flame on>
But please, someone bring European hardware/software business
products over to the US!!!
ethernet , TeX and many other goodies await if only someone
(like atari) would push this or the mega hard in the US as a
sensible alternate office machine !!
<flame off>
Thats my 2cents. If I offend any MAC owners dont write- I love
MAC software I just dont love the MAC price all that well. As
for the XT ditto....

You might start by reading the sun-spots digest - you'll see enough bug reports to make your eyes bug out. Just as the most trivial of problems, you might wonder at the coined phrase (sorry, I forget who I'm stealing this from) "the connector is the network."

Lots and lots of problems, no single one of which renders a Sun totally unusable, but altogether adding up to too many headaches. Bad network support, flaky network services, etc. etc. etc... For a company whose motto is "the network is the computer" it's pretty disgusting how poorly their network software runs.

[disclaimer - these are my own personal opinions, and don't reflect anything about anyone else anywhere else in the world, as far as I know, employers included...]

5513. Reading the clock of the BMS 1000 host adaptor

Newsgroup: comp.sys.atari.st
Date: 1988-09-15 06:57:43 UTC
From: meulenbr@cstw01.UUCP
Message-ID: <245@cstw01.UUCP>
Source record: 250713

Hi!

I own a BMS 1000 host adaptor which connects my hard disk to my ST.
This adaptor has an onboard real time clock.

BMS supplies a program for the auto folder to initialise the system
clocks. Quite conventient.

However, since I boot a different operating system every once in a
while, I'l like to write a program with the same functionality for that
system.

Has anybody any idea how to read out the BMS clock? (or perhaps a piece of
code to do so ??).

Many thanks

5514. Strange '-s' flag behavior in the GNU linker ?

Newsgroup: comp.sys.atari.st
Date: 1988-09-15 08:59:17 UTC
From: VBRANDT@DBNUAMA1.BITNET
Message-ID: <8809150858.AA16391@ucbvax.Berkeley.EDU>
Source record: 250714

I have found what is not quite a bug, but a somewhat annoying feature in the GNU C linker. It seems that the '-s' flag does exactly the opposite of what I think it should do. If you don't specify '-s', the linker appends a symbol table to the executable, if you do specify it, no symbol table is produced.

This means that to make executables without symbol tables, one cannot use GCC, but has to invoke everything manually. Also, all the executables from the GNU package themselves have quite big symbol tables. Removing them would save several KB, which might help people suffering from storage/memory shortages.

Anyway, thanks to John for his impressive work !

From: terrell@druhi.ATT.COM
Message-ID: <3571@druhi.ATT.COM>
Source record: 250715

I have received a couple of letters from people having difficulty getting AstroCal to print to a printer...

For the calendar and all of the reports, when you get the dialog box asking you for the date of the calendar or report, there is a button marked PRINTER. If you select this button with the mouse the output should go to the printer. This is the case with the first version of the program that I posted and the new version also.

If this doesn't work, please let me know.

5516. Genie vs. CompuServe

Newsgroup: comp.sys.atari.st
Date: 1988-09-15 13:32:00 UTC
From: brantly.henr@XEROX.COM
Message-ID: <880915-063322-2337@Xerox>
Source record: 250716

This is strictly my own opinion.....

I've been using CompuServe for approximately 2 years, and have been, for the most part, quite satisfied with the services provided. I have however experienced some difficulty in communicating at 1200 baud (occassional trash characters).

The current rates for CompuServe are $6 per hour @ 300 baud, $12 per hour @ 1200 baud. (Because of my 1200 baud problems I've been doing almost all of my stuff at 300 SLOW, SLOW baud.)

Several months ago I saw an advertisement for Genie and decided to give it a try. Rates (non-prime time; that's the only time I use it anyway) are $5 per hour for both 300 & 1200 baud. The initial sign-up fee is $29.95 (but you get 2 free hours worth $10).

Impressions of Genie from an ole CompuServe user:

(1)

Wow! The ST roundtable is great! I expected less, but there appears to be not only more stuff, but there appears to be newer stuff than CompuServe!

(2)

The Genie menus make the CompuServe (new) menu structure look pretty sick. To me, it's MUCH easier to get around on Genie than Compuserve.

(3)

In the ST roundtable on Genie, when you go the ST libraries, you can search ALL libraries at once! [ever had the problem where you wanted to find a file, but didn't know where to look?]

(4)

I can talk to Genie @ 1200 baud error free! Don't ask me why, but I can now talk at 1200 baud error free for $5 per hour, vs $12 per hour on CompuServe with trash.

Genie is owned/operated? by General Electric. When I signed up they gave me a personal phone call to verify my order. They had a "free" genie intro manual to me in 3 days! They had a large "free" users manual to me in a week!

Genie doesn't seem to have, as of yet, a large amount of business "stuff" like CompuServe, but I don't ever use it anyway. They do have Shopping (alot of the same businesses as CompuServe), Computer roundtables, airline reservations, etc..... (a LOT of stuff I haven't looked into yet, I'm having too much fun on the ST roundtable).

A clarification here, a Genie "RoundTable" is the equivalent of a CompuServe "Forum".

Anyway, Genie has won me over, I would definately recommend that individuals give it a test flight to see for themselves.

I am in no way associated with CompuServe or Genie, I don't have time for another job!

Dennis.....

I wasn't going to respond to this figuring that there would be a
huge response from Sun users, but since it wasn't posted to the sun newsgroup
I'll put in my $.02 worth.

I've had a Sun on my desk for 4 years now, and my department has
about a dozen. Schools by us have Sun's by the 100's. Compared to other
machines, Sun's software is top notch and we frequently use the sun's to
monitor our networks. I really think that Howard's opinions are in the
minority viewpoint. So much so in fact, that it would be interesting to
find out what he *would* recommend to his worst enemies as an alternative.

5518. more on CD stuff

Newsgroup: comp.sys.atari.st
Date: 1988-09-15 13:52:00 UTC
From: UUCJEFF@ECNCDC.BITNET
Message-ID: <8809151442.AA22918@ucbvax.Berkeley.EDU>
Source record: 250718

In the current issue of Computer Music Journal, there is mention of audio amplifiers with digital input so you can use there 4 times oversampling DACs. This intrigues me. What is the format for this digital interface. Could one possibly send digital information through the DMA port and use the ST as a sampler?

Jeff Beer, UUCJEFF@ECNCDC.BITNET

5519. Don't Bash (was Re: Boycott Apple Again -- Now about Suns)

Newsgroup: comp.sys.atari.st
Date: 1988-09-15 14:14:19 UTC
From: davis@clocs.cs.unc.edu
Message-ID: <4210@thorin.cs.unc.edu>
Source record: 250719
Cross-posted to: comp.sys.ibm.pc,comp.sys.mac,comp.sys.amiga,comp.sys.atari.st

Sorry for the gross cross posting, but I have no idea in which group
the germain posting originated. Note Followup-to.

In an article (Somebody) writes:
> ... [some Sun Bashing]

Come on Guys. You will bash anything. But let's not bash the good
guys without reason.

Yes, there are some problems reported about Sun, but name another
company that come even close in competing. (I can name a couple I
would like to see compete, but Sun is now a BIG company.)

Yes Sun's software is buggy. But not very. SunOS is administered by
one fulltime person at our site of almost 100 Suns. This is compared
to the three required to maintain 6 BSD 4.2 Vax systems three years ago.
If you want to talk about buggy, let's discuss OS 360, any release less
than 15. I seem to think MS/DOS 2.0 was bad, also, but I didn't have
intimate experience.

Would you rather buy from DEC (which had the goal of lowering the price
per MIPS to $40,000 in 1988 {10 times the SUN goal}). Basically Sun
has maintained about a 2 to 1 price performance advantage over the big
competition and continued to introduce new and improved products (like
NFS (which everyone liked) and NeWs (which wasn't so great) and SunOS
4.* which is so major a change that we won't appreciate it for years).
A recent posting in SunSpots indicated that Suns price/performance for
software maintenance was also about twice as good as DEC's.

So far Sun hasn't sued anybody. (How many companies has Apple forced
to cripple their product or sued out of the business? I have lost
count.)

Yes, you can critize some of the things that Sun does, but bashing
(implying that it is a bad company and you should not consider buying
their products) should be reserved for companies with questionable
business ethics (like suing the competition our of business because
they have a better product).

By the way, I have offered several examples concerning Apple. I do
not mean to imply that Apple is the only company conducting business
in a manner that I consider unethical.

I have also referred to DEC. This is a company that conducts business
in an ethical manner(In the main. You can find questionable examples
for any company, even Sun :-).). They are just behind the technology

curve, so their products are somewhat less desireable to me.

Thanks - Mark (davis@cs.unc.edu or decvax!mcnc!davis)
Disclaimer - I am not nor have ever been an employee of Sun Microsystems, Incorporated. I use and recommend their products, but I use and recommend a lot of other vendors products, too

> This is damning with faint praise. Not only does Atari need to stop
>making announcements too far in advance, they also need to release new products,
>especially those they have been talking about for so long.

It's really ironic. At the last major computer show, Atari, following its new no-vaporware policy, did *not* display the non-product ABAQ, nor the rumored 68030/*nix box. This was immediately interpreted as a product cancellation by many. In fact, it represents a verifiable commitment on the part of Atari to *not* show unavailable products.

Sometimes, you just can't win, no matter what you do.
>
> Unfortunately Neil Harris was also hinting about something new on the
>horizon. I would love to see all the good things Roy's talking about, I hope
>I will see them, most of the time I think I will see them. But until I can walk
>into a store and buy them, they're just talk.

There's good news. For the first time that I can remember, I have seen a television commercial for the Atari 1040ST! It was shown in the San Francisco area, I think at 6:30 last Saturday, I can't recall the station. The advert compared the cost/byte of the 1040 versus the Macintosh and the IBM PC, and displayed the slogan "Business is War".

I saw a second commercial later in the week for the 7800 video game. It seems that Atari has decided that there *is* a market worth persuing in the U.S.

Furthermore, Atari is becoming a strong presence at Desktop Publishing conferences, with the lowest-priced entry-level system.

> A company's support is important to user's and developer's (and
>developer support is important to users). A company's support gives user's
>the confidence to buy the machine. This, along with company support, encourages
>developer support of the machine. Develper support give's the user even more
>confidence to buy the machine, which encourages more developer support. Either
>way, a good cycle or a bad cycle begins with the manufacturer.

Yes, but part of that developer support includes not obsoleting a company's current products by making changes to the O.S. which break existing software. Atari has demonstrated their understanding of that fact, even in the face of the pressure seen here and elsewhere to do otherwise. That is *true* developer support.

Atari has placed the value of end-users with an investment in software over the wishes of a few of us knowledgable about the internals of the system. The perception of the outside community, that Atari improved the operating system without breaking existing code, will be worth far more in the long run than a few insiders knowing that they did it "right", but broke dozens of products.

> What's so terrible about this? Isn't it usual to expect a company
>to help the customer, whether he be a user or a developer. I'm sure David
>is aware that negative comments may affect sales. However, in the long run,
>being honest about a company's problems as well as it's strengths makes your
>opinion worth hearing. Ignoring the problems won't make them go away.
>Support has to work both ways.

Atari Corp. is ready, willing, and able to help the customer with a legitimate problem with their hardware. They cannot be held responsible for defects in software they didn't write. They also can't help customers who don't tell them there is a problem. We see a lot of that on the net: someone has a hardware problem, and immediately gripes to the net, before he has even contacted Atari about a fix. How is that fair to Atari?

I have yet to see *anyone* complain that they went to Atari for help, and came away unsatisfied.

>
>Thanks for any help,
>Jim Cochrane

As far as I know, with MWC 3.0 (2.1.7 also), the method for using argc
and argv from a GEM type program is to NOT use the -VGEM flag,
instead, use the -laes -lvdi options as the last part of your cc command:

cc -o myprog.prg main.o mod1.o mod2.o -laes -lvdi

As far as _I_ can tell, argv[0] is undefined, and is NOT standard K&R
from the desktop, but from the MSH shell it's OK (supposed to be the
name of the program being executed).

I am looking for an excellent gaming machine. (Before you get all puffy, I know darn well that the ST and amiga are much more powerful than just a game machine- but I have other computers that I use for work & such...) Anyways, I am cross-posting thing to comp.sys.atari.st & comp.sys.amiga cause I can't decide which machine I should get for home * GAMING * use. I don't care to hear all the other aspects (most I already know) but I want to hear which has the best games, the best graphics (in game out), etc...

I would like to here prices of people willing to sell their low-end machines to upgrade, etc. Send me a few for-sale ads.

Thank you

After checking the Sun bugs database I find that Purdue has called in seven (7) bugs, of which 4 were fixed more than two releases ago, 2 are fixed in the current release and one is fixed but it isn't in a release yet. Oh and *none* of the bugs have your name on them. Do you work for Kirk Smith?

Anyway, the point is twofold :
a) We have bugs and we know it. Sending them to bugs@sun.com (sun!bugs) and most times to Sun-spots will get them brought to our attention and fixed.
b) Where was the content of this posting? What exactly was it that got you so irritated?

Anyway, hope you feel better for having said it. Sorry we haven't been able to meet your standards. We will continue to try. And of course we need your help to point out those things that you feel are problems, as sometimes we don't see them that way and thus don't change them.

5524. Re: Deskjet drivers

Newsgroup: comp.sys.atari.st
Date: 1988-09-15 21:24:44 UTC
From: #FJMORA@WMMVS.BITNET
Message-ID: <8809160438.AA08186@ucbvax.Berkeley.EDU>
Source record: 250724

Some Deskjet drivers are already on the market or in PD.
For example, Migraph (phone (206)838-4677) sells a very good GDOS
driver along with their Easy-Draw package. Maybe it is available
separately. They give 3 screen dump utilities with this package,
one for color monitor and 2 for monochrome (one for horizontal
printing, one for vertical). Once installed, these utilities allow
you to print the screen to the Deskjet with Alt+Help.

For printing from word processors, you can download drivers for the
most popular programs (i.e. face it, the one you use is an extinct
species! :-)) from GEnie.

BTW, somebody wanted to know hoe to join GEnie. Here I repeat the ad
I found in my FLASH package:
1. Set up your modem for half-duplex, 300 or 1200 bauds
2. Dial (toll free) 1-800-638-8369. Upon connection, enter HHH
3. At the U#= prompt, enter XJM11837,FLASH and press return
4. Follow the prompts, with your credit card or checking account number handy.

Uploads are free, connexion is $5.00 an hour in non-prime time, plus
phone bill (you have better to be in a city where there is a GEnie access
line, or else it will be expansive).

Disclaimer: I have no share in any of the companies above-mentionned,
I am just a satisfy consummer. And I wrote the 1st Word Plus driver
in the GEnie Atari library, so anybody should be able to do it.

! There are a couple (at least) of products out that allow you to
!connect an AppleTalk Network to Ethernet. If you did have an AppleTalk
!compatible port on the ST you could then hook it to Ethernet. Of course
!..... If you want Ethernet it is probably going to be
!cheaper to design something to run off the DMA bus instead of going
!through an AppleTalk to DMA converter.
!
! Dan Moore

*Someone asked about ethernet for the atari ST. We (our group at Delft
*University) are currently inquiring about the German product. It is
*supposed to be used at the University of Aachen. I hope to hear from
*it next week. When I hear something, I will post it.

*Hans Buurman

So close yet so far...

BMB Canada made and sold (2?) "ST-network to-PC" dma boxes
called imaginet but the product is no longer available (I just
called 9/15/88).

There seems to be a German ethernet card but how do you get it?

MAYBE SOMEONE AT ATARI CAN SHED SOME LIGHT ON OBTAINING
NETWORKING FOR THE ST?????

maybe this is the kind of product for the entrepeneur (like
MagicSac?)
speaking of which ....
if you had a Spectre 128 AND a DMA-2-SCSI board could you then
run a MAC ethernet or appletalk?

Go ahead, save those dollars and buy a SUN, they just raised their prices
too. So getting a SUN station, will cost you another $1000 or more too.
(BTW what software you going to use on this SUN thats reasonably priced)

I think this is funny, everyone has known for a long time that prices in
the Electronics industry have been going up, how long do you think that
Companies are going to continue to absorb these costs before doing just
what Apple, SUN, and many other companies just did "raise prices".

Message-ID: <880915223629.007171@PCO-MULTICS.HBI.HONEYWELL.COM>
Source record: 250728

I sent away (a while ago) for my upgrade to Cyber Paint 2.0. I recived it fairly soon after, however, I did not recive the new documentation. I waited a while, and decided they forgot to send it, so I wrote them a letter. A few days later I recived the documentation. Now, a while after I recieved another copy of Cyber Paint 2.0 (hence the subject, I recieved two copies of Cyber Paint 2.0). I don't know what they are doing. The new copies don't seem to be any different except for the style of disk labels they used. The all have the same files, and seem to have the same version of Cyber Paint. Well all I can say is that they were very good in sending the manual soon after I wrote them the letter. I cannot figure why they would send me another copy of Cyber Paint, so long after I recived the manual. I made it perfectly clear that I had the software, just that I did not have the documentation.

Oh well...

>would fix the media change bug.

Replacing the drive would fix the problem if you had one. The
behavior you describe is the *normal* behavior for a stock ST. The
media change bug exists when a write-ENABLED floppy disc is removed,
and another disc inserted, and the machine does not detect the change.

The glitch on the write protect line, which TOS polls during VBI,
(Vertical Blanking Interrupt) isn't long enough to be detected with
write-protected discs. However, it isn't a serious problem since you
can't write to the disks and therefore won't clobber them.

From what you describe, you don't have the bug.

To diagnose this bug, you put a write-enabled disk in the drive and open a window on it. Then you wait for the access light to go out. Now take the disk out and put it back in, then hit escape. If the drive doesn't spin, you have the bug.

For TOS 1.4, diagnosis won't be so easy, because hitting ESC on the desktop ALWAYS causes the disk to spin -- it causes media change on the drive, to take care of the possibility that you changed the disk while it was out of the drive.

In the case of write-protected floppies, it is normal for the ESC key to cause a quick response if the drive was accessed within the last second and a half: this is a "grace" period so we aren't checking the serial number on every single access.

From: Fidgit Greylock
To: All Msg #214, 13-Sep-88 12:53am
Subject: New version of GS-Point released

The new version of GS-Point, v0.61, has finally been released. For those who
don't know, GS-Point is a non-commercial package that allows an Atari ST user
to act as a FidoNet point, and receive and send network mail and echomail.

New features in v0.61 include:

o A completely redesigned user interface. The new full-screen
interface is much more intuitive and easy to use than the old
one.

o GS-Point now knows about zones and can correctly handle messages
coming from and going to other zones.

o Password-protected netmail sessions are now supported for both
WaZOO and "LoTek" sessions.

o GS-Point can now be invoked in a "poll-only" mode from a batch
file or scheduler.

o GEM-based text editors can now be used to edit messages, as well
as TOS-based editors.

GS-Point v0.61 is available for file request and for first time download on
FidoNet node 1:321/112 (BBS phone (413) 253-5518) as GSP-061.ARC or as the
magic filename GSPOINT. File requests are accepted at all times except
between 4am and 6am EDT.

i'm really glad that Sun doesn't meet this weenoid's standards!

Sun is *very* impressive. both with regards to current
computing industry standards and in historical perspective
with the DEC of the 70s and earlier.

buy their machines and their stock and you won't do wrong!

(i'm not employed by Sun, but i'll take a spare 386i, if
they've got one lying around).

5535. umoria 4.87 for Atari ST

Newsgroup: comp.sys.atari.st
Date: 1988-09-16 03:26:04 UTC
From: saj@chinet.UUCP
Message-ID: <6599@chinet.UUCP>
Source record: 250735
Cross-posted to: rec.games.moria,comp.sys.atari.st

I promise to be a good boy from now on, but I can't resist posting a character with an interesting life story. He has lived all his life on an Atari 1040 ST. He has survived 3 rounds of major bug fixes, and the only bugs he's seen in the last 20+ hours of play have been Killer beetles. The program which constitutes his world is presently being posted in comp.binaries.atari.st. The moderator of comp.sources.atari.st has ordinary diffs between the source posted in comp.sources.games and that compiled with Mark Williams C v 3.0.6 to produce this version (they aren't very big; however ST curses is not included--it's fairly easy to find on BBS-s); whether he posts the diffs is up to him.

I am willing to US Mail executable and complete modified source (plain, arc-ed, or arc-ed and uuencoded: say which) to anyone who maintains a uucp-accessible archive mail-server (like lakesys) or to anyone who maintains appropriate archives on a machine which allows the general public to log in and use the archive (like killer) (Bill Wisner already has the sources, but I have no idea if he intends to put them in the archives on killer). If you meet one of these conditions and want the stuff, email me: I buy disks & postage. If you have a good story why nothing else will work, and you don't meet the above qualifications, email me and maybe we can arrange something on your dime.

Re-emphasizing something I've said before: the ST version of umoria 4.87 is large enough to require at least 1 meg, and it runs under a command line processor.

I've been off the net for a while, so correct me if anything I say in this letter is wildly inaccurate.
In the Wednesday, Sept 14,1988 edition of this newsletter, David Beckemeyer adds his comments to a letter posted some time before that I didn't receive. In this letter, a user from West Germany (apparently) quotes a displayer as saying "What do you expect of a dying computer?".
Mr. Beckemeyer then writes that "Atari has played out their last hand."
Recently I talked to a local developer who had been to a recent trade show in West Germany and reported it to be quite a shock, as he stated that there were Ataris "everywhere", a comment that I here from the local Atari dealership often.
My question is this: What is the REAL sales flow in West Germany and the rest of Europe? Considering that they seem to be a dead issue in the (very) local area, and Mr. Beckemeyer states that this problem is in general, I feel a little bit worried that my investment could suddenly be worth nothing if sales really are dropping off, and continue to do so. I have bad dreams about TI-99's and Plus 4's!
Would some kind user from West Germany who REALLY knows please confirm these statements one way or the other? I'm sure I'm not the only user on this net who is more than a triffle conserned!

Maury Markowitz,
MAURY@LAUCOSC.BITNET

Thanks!

> unusable, but altogether adding up to too many headaches....

I would not base a decision on whether to buy a Sun on this. One should
know/understand that:

1. many reported "bugs" and problems filter out as improper installations,
configurations, etc. This may be a commentary on quality of the docu-
mentation, but there is nothing unusual about Sun's;
2. In my experience, Sun users/owners are more likely to utilize third-party
hardware than users/owners of other vendors' machines. It is almost
inevitable that one will eventually encounter problems relating to this
fact alone;
3. Suns are frequently networked to other vendors' machines through still
other vendors' comm. equipment. Problems arise in interoperability.
Sun users/owners typically find that they can tackle the problems more
easily from the Sun side than from the other vendors' side;
4. The sun-spots digest is much more active than other manufacture-speci-
fic groups, which relates in part to the technical level of people who
up to now have formed one of the primary markets for Sun. I don't see
the percentage of "problem" messages to total messages in that group
to be significantly higher than in other manufacture groups. But there
is certainly much more traffic overall.

For several years, our site utilized a cpu from a vendor with an excellent
reputation for quality and support. This vendor was conscientious enough to
publish a quarterly book, containing the 100's of known bugs, there status
and disposition. A casual glance at this volume would convince someone that
the system was virtually unusable. But even tho it was used for applications
development, we rarely encountered a reported problem.

Sun's systems my suffer from more bugs than usual. I have used a Sun, know
a number of people who own one or more, and have not seen anything that would
validate a claim of severe flakiness.

>be connected to the SCSI interface) can one write a CD which will play
>on an audio machine?

WORM disks are physically different than CDs, as far as I know. So unless the WORM drives change, which probably won't happen in the very near future, you won't be able to record a standard-format CD. This isn't to say that someone won't come up with a device to play WORM disks as you describe.

>I wouldn't mind archiving some of my old 45's. I
>know they would still sound like an old 45, but at least they wouldn't
>get damaged any further.

With a fairly high sampling rate, you can digitize your 45's on a computer and then store huge datafiles on a WORM for later playback. A Mega 4 has enough memory to provide a couple minutes of playback, I would imagine, more than enough time to load your buffer with the next few minutes. At 200 megabytes per WORM (at least that's what the WORM at work can store), that's a few 45's per disk.

Of course, the ST's filesystem isn't what you want to use (even if you could use it unmodified on a write-once device), since it can't handle more than sixteen megabytes per device. I've got a few ideas about what sort of system you might want to use, but I'll spare you the details unless you want them.

These are my opinions, and in no way reflect those of UCSC, which are wrong.

>main via argc and argv? I'm using Mark Williams C and when I try to use
>argc and argv with a GEM program the program bombs.

Although I don't use MWC myself, I will make a few remarks:
1) There is no means that I know of to supply parameters to a Gem
program if it is started from the Desktop.
2) If the program is started from a shell, the shell should be a Gem
program, otherwise the program cannot use Gem functions. I'm not very
sure about this one, though.
3) You don't need to do anything different for a Gem program than for
a Tos-Takes-Parameters one.
4) The bus error is perhaps caused by incorrect treatment of the
argc,argv list, e.g. accessing an element argv[i], with i >= argc,
or argv[0], whose contents is undefined (GEMDOS does not pass the
program's name). I even think there are compilers that put a null
pointer (not an empty string pointer) in argv[0], which is in effect
incorrect - argv[argc] should be the first null pointer of the list.

It looks like I've finally gotten a program working for posting news directly (with UUMAIL) to a normal uucp node. It is currently set up for my site only (compiled in values rather than a configuration file), but it should be generalizable.

On another subject, I recently got a beta-test copy of the Sobozon C compiler. It looks very nice. As I understand it, this program will be freeware, not shareware, and not using the obnoxious GNU license scheme. Under the GNU terms don't you have to make any programs COMPILED the GNU C and/or LINKED with the GNU library available under the GNU terms? Sorry I got sidetracked, anyway, at least one of the authors is on usenet, so I'll let them, Tony Andrews, Johann Ruegg, or Joe Treat, tell you more about Sobozon C. In a message Tony left on my BBS, he mentioned that there were some compiler benchmarks in this months STart magazine and Sobozon compared quite well against the commercial compilers, rating better than all the compilers listed in two catagories, one of which was I/O. That makes me happy, since they are using extended dLibs for the runtime libraries, and thus the dLibs I/O routines are apparently pretty fast.

Two products I know which let one create large ram disks are:

Shadow (from Antic, reset proof on a Mega)
Hybriswitch (from Hybrid Arts, and I think there is a shareware
version of it floating around, also reset proof on Mega).

Hope that helps a bit!

Well, I've made my share of postings to Sun-Spots, but I surely wouldn't want them misinterpreted as advising people against buying Suns. Reading an unedited list of problems from users is always a frightening experience. The monthly listing of bug reports from DEC for TOPS-20 was far scarier than Sun-Spots. (Presumably the same is true with VMS, but I don't look at those.) Back when I looked at bug reports published by IBM for MVS, it was amazing what sorts of bugs there were even in that very reliable system. (They even had this special mechanism for giving you last-minute information on which of the patches they published shouldn't be installed because they turned out to create more problems than they solved.) About all one can say is that there are lots of users out there trying lots of things and so they run into lots of problems. Many of them are user confusion, but there are also plenty of bugs. Sun-Spots is mostly a sign of a large and active user community doing lots of interesting things.

Manually compare the tos and gem runtime startup modules. Sources are
provided with Mark Williams C. You might also try linking directly with tos
startup instead of gem startup. The the only thing you have to remember is
that linking with -VGEM also includes the Gem library. Link with something
like;

ld -s -o output lib/gcrts0.o objectlist -lvdi -laes -lc

That should do it.

I don't have any figures, but looking at out local stores, I'd say the ST is not dying. The STs and Megas are selling, as is software, there is no market growth. In the computer industry, stability looks like slow death. This is exaggerated by the fact that Amiga sales have been picking up for a while (but I suspect they wil slow as well).

As for Beckemeyer, I would agree that his sales are not a good barometer of the ST market. He deals in tools, and business systems--two areas where the ST is pretty much locked out (until there are PC compatible card cages and co processor boards) because there is not the huge customer base. I also suspect that to some degree, BDT products have reached some saturation point. And BDT sells PC baced systems, which obviously are more attractive than ST systems.

I was just watching a movie during prime time here in Canada and saw
a commercial for the Atari 520 ST. The ad claimed that the 520 is twice
as powerful as most business macnines and had great graphics and games.
The ad was very well do although they did seem to want to cram a lot
into a 30 second spot. Now why would a company that a lot of people claim
is dying all of a sudden spend lots of money producing spiffy ads, it just
doesn't make sense.

Just thought I would throw my 2 cents worth in.

>table to the executable, if you do specify it, no symbol table is produced.

'-s' does not stand for symbol / no symbol, but for strip. This option
is passed to the loader, and means: strip off the symbol table. The
default in Unix is to have a symbol table in your executable (so the
debuggers are not too bad to work with, although -g is preferred if you
want to use dbx).

> This means that to make executables without symbol tables, one cannot use
>GCC, but has to invoke everything manually. Also, all the executables from

>save several KB, which might help people suffering from storage/memory
>shortages.

I do not quite understand your problem. Put the -s in your makefile, or
add -s to CFLAGS. Now you can invoke make with no special parameters.
As for removing symbol tables, that's a job for strip(1); no doubt there'll
be an ST version soon (if it isn't already there).

> Anyway, thanks to John for his impressive work !

I fully agree.

Leo.

5550. Re: problem with mwc atoi(), version 2.0.1

```
In article <12562@ncoast.UUCP> btb@ncoast.UUCP (Brad Banko) writes:
|
|What is wrong with the following code?
[some lines deleted]...
|#include <stdio.h>
|/* #include <math.h> */
|
|#define MAXVAL 32767
|
|main(argc,argv)
| int argc; char *argv[];
|{
| int i, x;
| extern int atoi();
|
| for (i=1; i+1<=argc; ++i) {
| x = rand();
| printf("%d %d %s %d %d %d\n",
| x, i, argv[i], (double) x / MAXVAL, atoi(argv[i]),
| (double) x / MAXVAL * atoi(argv[i]) + 1);
| }
|
| putchar('\n');
|}
|
|The code compiles, but produces bad (atoi()?) results... why? Why are
|the atoi(argv[i]) values bad (negative)?
```

The arguments supplied to printf() are not conforming to the format:
(double) x / MAXVAL is of type double (probably 8 bytes on the stack),
while you try to print it as an integer (%d) (2 bytes in mwc ?). So the
first three arguments print correctly, but the last three are taken
wrongly from the stack, and besides are interpreted wrong (as integer,
but they are double,int, double. Using a cast (int)(double expr.) for the
double expressions should solve your problem.

Leo.

With eternal2 you can use the spec <drive>fff (or <drive>???, I can't remember which) to get the max size. I have gotten eternal2 to work with the MEGA ROMS as follows:

1. To resize: Hold both the alternate key AND the right shift down.
2. To remove: Hold both the left shift key AND the right shift key down.

I have no idea why one must hold down the right shift key. According to my documentation this should not be necessary. It is not necessary to do so using the earlier versions of TOS.

Just don't use the GEM switch on your link line. For some
unknown reason Mark Williams uses a different startup routine when you
say you have a GEM program. If you don't use the GEM switch you get the
standard startup routine which lets the program accept command line
arguments when you launch from a command shell.

Nice to hear, especially from a dealer. Now let's get Atari to crank up
that distribution/advertising shortfall in the US, eh?

>David Beckemeyer claims that ST sales are now only 20% of BDT's business.
>I submit that that's because, powerful as they are, BDT's products are a
>pain in the gluteus maximus to use.

Good point! I hope BDT doesn't go crazy at me for saying this, but I had
to get an ST word processor over the summer. After looking at everything out
there (especially at WordPerfect for the ST, what with all the "big software
house making ST titles" hoopla), I settled on ... WORDUP!

Maybe this is just a sign that (currently) the majority of the Joe ST-user
public does not _want_ or _need_ all the features of WordPerfect (especially
at the price). Forget piracy, forget "dying ST" theories, people will buy what
they NEED. And if they don't need WordPerfect, well...

>Atari has found their market. The great silent majority. The same folks
>who voted for Reagan, read The Enquirer, and made The Gong Show a hit.
>There's a lot of them out there...

Silent majority, yes (all of us who keep harrassing stuck-up Apple dealers
can relate). Voting for Reagan, no B-). The Gong Show, definetely!

>(Sorry if I sound bitter, I just get tired of working with the brain-dead.)

'sokay, I can relate.

--R.J.
B-)

P.S. And if I haven't already, let me give an unsolicited endorsement to
Neocept's WORDUP. A very good GEM-based word processor, with _lots_ of
potential to do even better (is it true that Neocept is currently doing a
total rewrite of the program?). Fun to use, even if it is GDOS-based (all
that RAM for fonts!), and the multiple fonts and graphics make it just like
those fancy-dang overpriced Macintosh WPs.
(If only this was released two years ago -- YOW!)

The sun-spots digest is one of the most useful, informative and entertaining
groups that truly reflects the popularity and commitment of Sun's many
satisfied customers.

The comment on the connector is not a Sun specific complaint, it refers to
a long debate on comp.protocols.tcp-ip, regarding the DB15 ethernet drop
cable attachment as used by *all* ethernet vendors ('cos its in the standard).

Read sun-spots, not these flame wars :-) for the full story.

I think that this discussion has gone quite astray. Suns and Macs are, for 99.5% of the computing world, oranges and apples.

A Macintosh is designed to be a standalone personal computer that will basically run correctly from the moment it is turned on. It is designed around the assumption that the user is not very sophisticated about computing.

Suns are diskless workstations, which can be given local disks to allow them to run in standalone mode. A Sun can only be used easily when there is a sophisticated system manager available who will work out the kinks in issues like swap space, disk partitions, etc.. If you are such a person or are part of an organization that already has such a person, a Sun may be a good choice. There is lots of free software that runs on Suns and is useful. For much of it, though, you may need to run make, extract shell archives, and run dbx from time to time. However, I don't think you can find a $150 WYSIWIG word processor for the Sun that will print on a $500 dot matrix printer.

In my experience, the only time that Suns and Macs become comparable is when you talk about the bottom of Sun's line (3/50 with a 70meg SCSI disk) and the top of Apple's (Mac II with 80Meg disk, A/UX, 5+Meg of RAM).

Network based Sun systems do appear to be more fragile than Macintosh systems (which do not depend on the network for critical resources, like virtual memory). Some of the fault lies with Sun's decision to trade-off reliability for speed and simplicity in the Network File System. But much of the time, any problems arise from the decisions made by the administrators of the local system to spend $5000 on a new 3/50 instead of another 4 Meg of memory for the file server. A Sun is a good machine if you are a programmer or can afford to hire one. A Mac is a good machine no matter who you are, but is not as good as a Sun for computer science research and some other technical pursuits.

Pardon my little harangue,

[closing stuff deleted]

Hmmm... Assuming the entries in ICDFMT.DAT for your controller and
disk drive are correct and you aren't having any cable problems,
I would guess its the Atari Host Adaptor that's causing you grief.
There's a known problem with the PAL chip on Atari's Host Adaptor
that causes it to respond to all LUNs, even if only one drive is
present as LUN=0. Maybe this problem also interferes with operating
more than 1 drive.

There's a couple of possible remedies you could try. First, you can
buy a replacement PAL chip that's supposed to fix the problems with
the Atari Host Adaptor. One such chip is available for about $20 (US)
from:
Berkeley Microsystems
360 Oakland Avenue, Suite 5
Oakland, CA 94611
(415) 465-6956

Second, you could purchase ICD's Host Adaptor board. This will not
only fix the LUN problem. It also gives you a battery-backup clock,
a DMA Daisy-chain port, and greater immunity to cable noise. The latter
allows you to run a 36" DMA cable to the drive. The ICD Host Adaptor
goes for around $135 (US) and is available from:

ICD
1220 Rock Street
Rockford, Il 61101-1437
voice: (815) 968-2228
modem: (815) 968-2229
fax: (815) 968-6888

Here's my Hard Disk Story:

I had an Atari SH204 20Meg Hard Disk. I needed more disk space and
didn't want to spend another $600 for 20megs. (Not to mention the fact
that the SH204 has no Daisy-chain port.) This is what I ended up with:

(From my SH204)
o Seagate ST225 20Meg Hard Disk
o Adaptec 4000 Controller

(From my local Hard Disk Dealer)
o Seagate ST251 42Meg Hard Disk

(From ICD)
o Host Adaptor Board
o 5 1/4 Hard Disk Case (w/HDA Mounting Kit & Cutout)
o Controller-to-Disk Cable Set
o 36" DMA Cable

Using the ICD format software, I'm able to get 22.2 Meg from the ST255
and 44.4 Meg from the ST251, for a total of 66.6 Meg of Hard Disk.
Total cost was about $650 (US), about the price of another SH204.
I've been using this setup for around 4 months without a hitch. I also
feel much more comfortable using the ICD HD software with it's
read-after-write verify. The only problems I had were with the Hard Drive
Case. Some of the drive bracket mounting holes were miss-aligned and had
to be re-drilled, the hardware-kit (screws,etc) didn't have the right
hardware, and space is _real_ tight inside the case. Nothing a drill and
a trip to the hardware store wouldn't solve. Also, saving the leftover
SH204 parts gives me a head-start on my next storage increase. By just
adding an RLL controller, a 96Mb drive, and replacing the PAL chip on the
Atari Host Adaptor board, I'll have more storage than I'll possibly need.
:-) :-)

Hope this helps,

Ric Clayton

I've found 2 instances in which SHADOW always crashes.

i) Use GULAM's rx to receive some files. THen invoke SHADOW at some
point later. Two bombs (i think).

ii) Use UW.prg. Then invoke SHADOW while in UW.prg or at some point
later. Same two bombs.

And doing a warm-boot will not revive SHADOW. It will still crash
until a cold boot is done. Has anyone else been hit by this? I'm using
version 1.01 with a monchrome and a 20Meg Supra.

I've used BDT Micro-Cshell and AnsiTerm. Both are good programs.
However, there're quite a few public domain programs out now which are equally
good (if not better) when compared to SOME of BDT's programs. GULAM and
Uniterm comes to mind. I think this might be one reason why sales for BDT has
declined.

The media change bug has to do with the type of disk drive used.I ran
into this problem when upgrading my 520stfm to double-sided drives.I
had problems (media change)with a Panasonic JU-364 ,but not with a
Mitsibishi model MF 353B-88UF.
I'm not certain ,but I think it has something to do with the way the
write protect tab is detected.(optical or mechanical)
Maybe someone else can clairify this a little better for us.

As the new owner of an ST2, I'd like to add my two cents about this "dying computer" hoopla.

While shopping around for my computer, many dealers told me whatever they could to discourage me from Atari and get me into an Amiga:

"Atari ST computers are hard to get and we can't keep them in stock. They're backordered and who knows when they'll come in."

"There isn't any profit margin in Atari computers since Atari shut out the discount mail-order activity."

"We don't discount our Atari computers, except for demos, because they're hot sellers and we don't need to."

"Most people are opting for Amigas these days because the Atari is pretty much of a dead end. Look at our software shelves - 90% Amiga and less Atari stuff everyday. No one is buying the Atari stuff."

I ended up buying my Atari from a local music store, from stock, at a discount, and they got me all the software I wanted within a week, again at a discount (music stores don't sell lots of compilers!). The discounts rivaled those mail-order outfits that the other dealers seem to think are out of business.

I can only speculate as to why these dealers are verbalizing these conflicting packs of lies. Somehow they must figure that they can make more money by doing it. Maybe they're overstocked on Amigas? ;-)

Jim,

You probably compiled your program specifying the -VGEM or -VAPP
option to the compiler driver cc. For an unknown reason, the GEM runti
runtime startup sets ARGV to NULL. Just take a look at the source, or
at the manual at page 141 (entry crtsg.o).

Solution: call cc first with option "-c", and then call the linker
yourself specifying both the correct runtime startup crts0.o and the
VDI/AES libraries (-laes -lvdi). This will work!!

Daan Josephus Jitta (daanjj@neabbs)

Yes, AmigaDOS has less bugs than SunOS 4.0 indeed. And new Sun releases
come out about as quickly as Amiga software releases anyways - and the
most well known bugs don't get fixed.

Sun's right hand seems to have a problem with chopping of it's left hand
as far as I hear - somewhat alongs what C-A did awhile back..

```
In article <12562@ncoast.UUCP> btb@ncoast.UUCP (Brad Banko) writes:
> printf("%d %d %s %d %d %d\n",
> x, i, argv[i], (double) x / MAXVAL, atoi(argv[i]),
> (double) x / MAXVAL * atoi(argv[i]) + 1);

The way printf picks up arguments is as follows:
%d = Pick up 2 bytes of x (which is an int) = OK
%d = Pick up 2 bytes of i (which is an int) = OK
%s = Pick up a pointer to a string argv[i] = OK
%d = Pick up 2 bytes of the 8 bytes that correspond to the value of the
expressiion "(double) x /MAXVAL".
%d = Pick up the next 2 bytes from the previous double-precision value
%d = Pick up the 4th and 5th bytes of the double-precision value
\n = Start a new line (which ignores the 7th and 8th bytes of the first
double precision result, and ignore the 2 bytes of the atoi value,
and ignore the 8 bytes of the 2nd double-precision floating point value.

The problem is in the use of %d with double. You should be using %f
for double, however you don't need double in this program; use ints and
longs instead.

There are a few things which may be missing here. First, last I heard, Atari Corporation are selling ST's of all makes as fast as they can make them - which many businesses would probabaly like to be in.

From a consumer's point of view, the ST is a bargain. It isn't very expensive, and is very sophisticated hardware (It even runs Mac software better than a real Mac - thank you Dave Small!). The programs are priced very competitive (the <$100 word processors blow away most of the things for the Mac and PC I have seen - at least in either price or performance).

The problem is for the *DEVELOPERS*. It isn't that hard to write ST software, and there is a lot of quality PD stuff out. Atari has not been very supportive (I realize that there is a new "push" at Atari, but it has not really materialized for the most part). I don't know how many are working for the European market, put that is apparently where at least half of the ST's are. And here, games seems to be a larger segement of the market than common business programs, much less esoteric utilities.

I don't know what Atari can do about this either - their logo is not one that most purchasers or managers recognize, or if they do, "Isn't that a game machine?" is usually the response. And with the DRAM shortage and such, they couldn't provide them in numbers anyway. I really liked the ad in that desktop publishing magazine, and hope to see more, but it is likely to require more. And part of the problem is to get these larger volume customers who are likely to buy site licenses and a lot more software (at least things other than games).

I would also perhaps appreciate some more recognition on the part of Atari that Software is a part of what sells the machine, and in some cases a large part - and not the software Atari writes. Perhaps Atari should consider aiding some of the developers in Atari's targeted ads by simply mentioning that such software is available from..., which they have done in their MIDI ads. I don't think the ST is dead or dying now, but it has to do something soon since the software supply will dry up otherwise (much as your doctor might tell you to quit smoking or lose weight - you won't die tomorrow, but you won't stay healthy indefinitely while indulging).

>much higher) but, of course, 2400 baud cuts your download time in half.
>I would recommend using 1200 baud for interactive online time; log out
>and call up again at 2400 baud just for downloads.

I have learned from painful experience that on Genie and CIS and other systems that 2400 baud is not necessary twice the speed of 1200 baud. The bits pass thru the modem at 2400 baud, and you are paying a higher rate; however, there are more pauses and longer pauses at 2400 baud. If you take two people downloading under similar conditions and load on the network, but one is downloading at 1200 baud and the other 2400 baud, it may turn out that the 2400 baud person takes less time than the 1200 baud person, but not close to half the time. Under heavy conditions both of them may take the same amount of time. Genie is better than CIS in this regard -- Genie sends the entire file to the local node that the user is downloading from quickly, and the local node handles the download. CIS sends the file in packets across the entire network which slows the download down considerably.

In the referenced article, Dale Schumacher referred to the GNU redistribution conditions. He was close, but a bit off. In the gnu.gcc newsgroup RMS stated that he considers the GNU 'copyleft' (essentially meaning free availability of all source code) to apply to anything that is a 'derivative work' of a Free Software Foundation product. That's a technical legal term there, and right now the best guess is that it means BISON output or anything linked with the GNU libraries, but not anything simply compiled with gcc and the associated tools.

> Just as the most trivial of problems, you might wonder at the coined phrase
> (sorry, I forget who I'm stealing this from) "the connector is the network."

1) It was "stolen" from me. I guess it's too late to apply for a trademark, right? :-(

2) Stop wondering what it means. It's a dig against Sun for putting such crappy ethernet tranceiver connectors on their machines, and is a direct parody of their "the network is the computer" slogan. You would think that a company which makes products which depend so much on networking (let's face it, a diskless workstations with a disconnected tranceiver cable is just a very large paperweight) would pay more attention to how they plug into that network.

I do not work with Kirk Smith, and these opinions are my own, and I make
no claims about or related to my employer. Take this in a personal
respect as I am sure we will be contacting Sun in an official manner on
these items and some others.

First, I did *not* mention bugs, although I could have, so you checking
a bugs database is kinda dumb. My *real* complaint is the state
that you send your distribution out in. I have hit three major problems:

1) Some sources are missing completely.

2) Some binaries don't match the sources, and we can't recreate the
binary without loosing functionality

3) Some of the sources even had syntax errors in them

Some other points, good and bad:
o The dyamic libraries are neat, although I have seen them before. (but
sun never did claim they invented them).
o The modifications to make can get pretty annoying.
o The system is also one big security headache, although that is true
of any workstation.
0 You guys were a little haphazard in moving some sources and not others.

I have a color Sun 3 in my office and it is just unacceptably slow.
Especially if you want to use X11R2, but it carries on to Sunview
also. It can get so that scrolling is no better than 1200 baud dial
up. HP's color workstation is about 100 times faster, although they
have thier own problems with networking.

Maybe I was a little harsh to say "my worst enemy". Everyone talks
so highly of Suns equipment that I was really disappointed when i
sat down and worked with one. If you are going to buy a Unix box,
shop around. Maybe Sun is *your* best buy. It is all a matter of

context: what are you getting it for?

I hope that future releases continue to improve, and I would much rather deal with Sun than Apple (or even Dec).

Again, I am stating what I think, not nessasarily how Purdue feels.

I must agree with Dave. I have been using Sun workstations for about 3 years
now and I think it is the best devellopement system around.
The Sunview window environment is a joy to work in compared to other
windowing systems I have seen. Mex on the Iris is totally brain damaged in
comparison to it. I have nothing bad to say about Sun (the computer or the
company). I really hate it when some people give there 2 cents worth when it
is only worth 1. Alot of people don't give things a chance to improve, if
it does not work first time then they refuse to look at it again.

I would love to see some info on the Atari Ethernet. Does anyone know
anything about it? Also, I have TeX for the ST. Someone just ported it
and sent it to our intermediate archive. FTP to clio.math.lsa.umich.edu
(35.195.16.4) and sign on as id ftp with any password. [If you were
using euterpe, switch to clio, you'll get a better connection] We're
still setting up our real archives on the 3090, but until then grab it
off there. Feel free to send something back to us :-), especially suff
that you ported and want to have distributed. Send sources too, we have
next to unlimited disk space.

i would appreciate learning about any tools which others might have
accumulated for unpacking split file postings to the net.
in particular, programs to run on both the host unix system and also
programs to run on the atari to automatically "shuck off" the mail
headers, etc. automatically.
also, does anybody have a shell archive de-archiver which will run on
the ST? thanks.

Hmm. I use a Sun 2/120 with x11r2 and it's not "unacceptably slow"
for most things. If you put xterm into "jump" mode you get good speed
on the scrolling. Of course you can't read it then but most people
can't follow stuff running out at more than 4800 baud anyway; that's
why "more" is there.

On a Sun 3/50 x11r2 performance is much better, although still slow
for really intensive graphics applications. This is mostly due to the
lack of a good x11 server for the sun. A quote from the documentation
of the Sun server:

"The drivers are completely untuned and have inferior performance."

If someone got on the ball and tuned the server you'd see much better
performance, especially on the color systems (like yours) where the
server is *really* untuned. I maintain that it's good enough to get
work done on, though. If you want real performance I suggest using a
Sun 3/50 (or better a Sun 4/110) as a smart graphics terminal to
something like an Encore. Yanking all the non-graphics stuff off the
Sun and putting it on a scream machine gives very nice performance and
is fairly transparent under x11; even my Sun 2 runs nicely when I
offload the application to a Silicon Graphics 4D.

It's true that Sun's are sometimes plagued with hardware problems, but
my experiences with their support were all favorable. In addition
they understand that not all users are stupid and allow them to do
board swapping and the like, something that I appreciate. I haven't
any experience with their newer machines (we have 2 Roadrunners and a
few Sun 4's coming, but nothing yet) so I can't comment on increasing
or decreasing reliability. So far I've had one mono card blow up on
me, a disk problem, and a couple of mono screens have flipped out, but
Sun dealt with them quickly so I've no complaints. I have no
idea just how long my Sun 2 has been around, but considering that it's
a Sun 2 I'd say that it's been awhile.

As for their software, it's a good and bad thing. I *like* SunOS, at least 3.5. Some of the networking stuff -- like the yp server -- is pretty hairy and not so reliable, but if you don't have a big network you don't need it and it runs very cleanly. NFS setup is simple and very easily maintained. Security is a problem but it ALWAYS is when the user has direct access to the hardware, not one manufacturer can say otherwise. It still takes a little ingenuity to really screw things up, to Sun's credit, and putting a password on single-user boots really blocks up some holes that exist in 3.5.

In summary I don't think you've voiced a valid complaint. There is virtually nothing else that works as well as Sun workstations in their price range. 386 PC's don't have anywhere near the networking support that Sun's do, almost never have good support, and cost nearly as much. Higher-end workstations (eg Silicon Graphics) often address these problems but they're for a more specific audience and cost a lot more.

>
> < dave stampf

I think we've seen more than enough of this topic, so I'll try to keep this short. First of all, I'm sure many schools have Suns by the 100's. I'm sure they're also often wondering if they'd made a mistake. I've heard many times how Michigan State University fared, with amazing ethernet broadcast storms and meltdowns rendering their campus-wide broadband completely unusable. We all remember the stories of Sun 3/50's ARP requests getting shunted along cross-country by ethernet bridges, yes? In any case, (consider this a challenge if you wish, I know you will not be able to meet it) you cannot put anywhere near 100 Suns on a single network, and get any useful service out of them. The network would simply collapse under too many collisions. I don't believe you will find any place running more than 40 machines on a single network.

Contrast this with, say, an Apollo network. Our engineering school runs over 300 Apollos on a single Apollo token ring, on two campuses spanning over two miles. There's no such thing as a network meltdown there. Diskless nodes don't have to have disk space pre-allocated on servers, and don't eat up bandwidth trying to find their own internet addresses. There's no need for special partitioning of a drive, no particular use for the mount command except for use with NFS. No need to dedicate any piece of disk to swap space - all disk use is dynamically allocated. All disks on a net are always accessible, quickly and transparently. They have a bunch of Suns now too, but they can't compare in performance to the Apollos. Using NFS, all 300+ Apollo disks are accessible thru a single mount point on a Sun. In contrast, it's an amazing hassle to keep fstab's up-to-date to keep all the necessary Sun disks accessible.

It would be nearly impossible to run a bunch of Suns as a well-coordinated network without Sun's Yellow Page service. All well and good, as long as it works, which is, unfortunately, not All the time. A Sun workstation just isn't configured to work in a network - load it up off the distribution tapes and it wants to think it's a standalone mini, like a big Vax or something. Its own

password file, hell, its own copy of /etc. You know how silly it is to have 25 copies of /etc/termcap or /etc/hosts online? I couldn't even keep a full hosts file in the yp database because it was so huge it would timeout during ypxfr updates. When 1 of the 4 ypservers went down, the silly machines were unable to locate any of the 3 other running servers, and the whole network was unusable. YP is supposed to be fault tolerant, and is billed as a dynamically load balanced system, but in practice it is as inflexible and fragile as a piece of thin glass. It was also quite disconcerting, when I went looking for possible ways to improve the code, to note that my sources and binaries were not the same version, even though they had identical SCCS IDs. (Different date stamps, different object files.) And I'm one of the fortunate few to have access to full Sun source code.

Contrast again with an Apollo network - these machines were obviously designed from the start to operate in a distributed computing environment. Sun's network support seems to be more of a hastily added asfterthought in comparison. The password database, for example is dynamically updated among what they call replicated databases. It's the same idea on the surface as yp - a few key nodes playing host to some servers. The implementation is much smoother though. For the password database, or "registry," there is also a locally cached registry, which maintains a selectable history size of local users, so even if the main registry becomes inaccessible due to a network failure, the node can be logged into for use. Apollo's network management software is easily the most sophisticated and mature as any I've seen. And with their filesystem, you won't find your NFS partitions temporarily evaporating, you won't be denied access to files that you own, etc. (This is certainly an odd problem to appear in a "stateless" filesystem, but Sun NFS often gets confused and will deny Joe User access to NFS mounted files that Joe owns. Usually fixed by a couple sync commands, so it's only a minor inconvenience at worst, but nonetheless it's a telling sign.)

So much for keeping it short. I didn't even get to talking about how much faster Apollos are, how much more responsive the Apollo Display Manager is than any Sun windowing system, how much more sophisticated the filesystem is, or a lot of other points. Or Apollo's Network Computing System, with which I can writea huge resource intensive application that will utilize all available CPUs and disks on the network. (250 68020's can solve a lot of problems in one helluvausmall amount of time!) So much for that. I have no vested interest in either Suns or Apollos, I use them both all the time. Obviously I prefer the Apollos, even though I'm maintaining 25 Suns here in Math. It's truly amazing how many people I've encountered have only heard good things about Suns, and never bad. Sure, they have their good points, but there's a lot of bad to be aware of, and, more importantly, there are good alternatives to be aware of.

I'm not particularly familiar with the ST, but since SetScreen is asynchronous,
the following code (based on Amiga code) should work better:

Generate animation in newscreen;
Vsync(); /* wait for previous SetScreen (of oldscreen) to work */
SetScreen(newscreen);
Go back to generate next screen.

This way you get to do computations while waiting for SetScreen, and there's
always a screen out there waiting to show up.

5588. Change your titles often!

Newsgroup: comp.sys.atari.st
Date: 1988-09-18 15:58:36 UTC
From: Robert.Lisowski@rubbs1.FIDONET.ORG
Message-ID: <56.2334538C@rubbs1.FIDONET.ORG>
Source record: 250688

People ought to change the message titles for their posts more often.
If you are continuing a discussion on the same subject, allow your
titles to evolve with the discussion so everybody can scan the titles
and see what the messages are actually about. It seems I've been
seeing "Another great quote from Mr. Good" and "To fix or not to fix"
appearing above a large percentage of posts here, and those aren't the
only ones that are recycled again and again. I'm not bitching, but I
think we would all be well served if everyone made their titles a bit
more original and unique. After all, a title should reflect closely the subject matter of
an article.

I realize you may want someone to recognize the post as a reply to a
previously posted article, so maybe you could put a number at the
end of the title, or modify the wording. (some use "(was: .....)", but
even THOSE are getting recycled, so there ya go.)

This post comes to you as a result of my having to read alot of
articles that don't interest me---due to poor titles. C'mon, it's
not that difficult to come up with original titles, just condense
what you are posting about down to about half a line.

PLEASE don't flood this area with replies to this message. If you
feel an uncontrollable urge to use your flame thrower, E-mail it to me.

Thank you for your time.

Rob

>
> Bill Oswald known as wao@aluxz
Possibly, but not in the near future, from Atari. The TOS 1.4 clean-up
gives us the source baseline for near-future processor-line expansion.
Resources will address that issue first.
Multiuser operating systems in the form of UNIX System V.3.1 (tm's for AT&T)
for 32-bit products, and the already/imminently available OS/9 and Minix
for the 16-bit.

^^^^^^^^^^^^^^^^^^^^^^^^ ^^^^^^^^^^^^^^^^^^^^^^
>Atari Host Adaptor board, I'll have more storage than I'll possibly need.
^^^^^^^^^^^^^^^^^^^^^^

This is what I thought, too. I replaced the Adaptec 4000 controller by
the 4070, which is completely compatible with the 4000, except that it
uses RLL encoding scheme instead of MFM. I also bought a second drive, a
Seagate ST157R, which is RLL and has a capacity of 49MB. The old drive
in the SH204 was (still is) an Tandon TM262, which is a 3.5", MFM, 20MB
drive. I checked out with Tandon, if that drive accepts RLL (i.e. if it
has plated media), and they said yes (although it was not certified for it).
Formatting the Tandon drive didn't cause any problems, but, however, it
has quite a lot of read errors. The errors do not appear in specific
sectors, but just randomly anywhere, especially on the cylinders with
low numbers, i.e. on the inner cylinders of the drive. It looks like it
mostly works just perfectly, but sometimes there are these read errors.

It seems that timing margins are so close, that it does not work properly from time to time. A few days ago I got the PAL replacement from BMS. It doesn't help very much, except that read errors are now 'officialy' being recognized.

If anybody is out there, who has similar experience, or who has a solution, please post/mail it...

Tomas

In article <JEFF.88Sep2035059@stormy.atmos.washington.edu>
jeff@stormy.atmos.washington.edu (Jeff Bowden) writes:
>I grabbed the gcc executables a few days ago. I found that I had
>insufficient resources to run it (sob :-( ).

Gcc can be run on a 1 MB machine! You will not be able to compile any larger
files from GULAM, but you can revert to compiling from the Desktop if memory
is a problem.

To bootstrap you NEED:
a copy of gulam
a diskeditor

1) patch the executable of gcc-cc1.ttp so that only 300 kB of stack instead
of 500 kB are allocated (you can search for the value 500000, it only
occurs once, somewhere around 364kB).

Yah, that's described in the blurb. In fact, 300000 is still far more
than you need; in my experience, 128K is plenty for most things. The
thing that really eats stack is compiling large hairy functions is -O;
the 500000 value is for compiling the instruction-cracking routing in
GAS. If you can live without -O, 64K or maybe even 32K will be enough.

[That you have to do this is really
a bug, there is NO need for a GEMDOS only program, that doesn't exec
another program to give memory back to GEMDOS, I'm changing my crt0
so that it will take -1L in _stksize to mean: "Don't do a Mshrink"]

Careful; memory that is malloc'ed comes from ABOVE the stack, not below
it, so you really do want to keep the stack at the smallest value that
works for you.

2) Now throw all resident stuff out (accessories etc. just keep GEMBOOT
or folderxxx (you do have a HD?)), start gulam and setup the enviroment
as described by jrd. You should now be able to compile most programs
(you can compile all of flex except parse.c and scan.c for an example).
This is a good time to get the sources and extract the documentation
from them, how else are you going to know about -mshort
-fomit-frame-pointer etc.?

Right. If there's sufficient demand, I'll package up the docs
separately; or someone else with more time could do so... hint hint...

3) If a source file is too large to be compiled from GULAM, you will get
a "no more virtual memory" message or someting like that (probably
already from gcc-cpp).

typically from gcc-cc1, actually...

You can workaround this by running the
compiler from the desktop, the current gcc.ttp will NOT work from the
desktop (reasons follow), so you will have to write a small wrapper
program to do this (I'm fixing gcc.ttp right now.....).

Note:
all gcc stuff assumes:
file-handle
0 = stdin
1 = stdout
2 = stderr
since the GEMDOS default for handle 2 is the serial
port, this isn't much good when you start stuff from
the desktop.

Yah, I've since realized that 2 is the serial port (!). If you fix
std-init, would you post the fixed version? Also, does anyone out there
have a description of what file numbers 'default' to what?

So you need a
Fforce(2,Fdup(1))
At the begining of your program to see any error output
(and due to a bug in stdio to see any output at all).

Trying this shows two bugs in the current runtime library:

- Fforce has a wrong binding in osbind.h,
it uses 3 short (aka 16 bit) arguments!
Write a trap-1www function to do this.
[BTW is anybody working on cleaning up
the library, there is a lot of stuff that
should be done]

No kidding. As I said in the doc, the library is pretty ragged. I'm
working on getting rid of the trap_foo functions, and generating the
traps in line; perhaps it makes sense to post a recompiled library whe
that happens?
[...]

Don't get put off by this description, GNC CC is worth it!

Glad you like it.

5592. Strange '-s' flag behavior in the GNU linker ?

Newsgroup: comp.sys.atari.st
Date: 1988-09-18 17:30:00 UTC
From: jrd@STONY-BROOK.SCRC.SYMBOLICS.COM
Message-ID: <19880918173048.9.JRD@MOA.SCRC.Symbolics.COM>
Source record: 250692

From: VBRANDT%DBNUAMA1.BITNET@CUNYVM.CUNY.EDU

I have found what is not quite a bug, but a somewhat annoying feature in the GNU C linker. It seems that the '-s' flag does exactly the opposite of what I think it should do. If you don't specify '-s', the linker appends a symbol table to the executable, if you do specify it, no symbol table is produced.

Well, I admit it's somewhat counter-intuitive, but the semantics of -s is unchanged from what it was in the unhacked LD.C. Ie, the default behaviour really is supposed to be to produce a symbol table. After thinking about it, though, it seems reasonable to change it in the ST version, as the ST format symbol tables are never useful.

This means that to make executables without symbol tables, one cannot use GCC, but has to invoke everything manually.

That's not true. GCC passes the -s flag along if it's specified. (At least it's supposed to; did I introduce a bug at the last minute?)

Also, all the executables from
the GNU package themselves have quite big symbol tables. Removing them would save several KB, which might help people suffering from storage/memory shortages.

Indeed. I'm pretty sure I built all the executables with -s (to GCC), so if they've really got symbol tables, perhaps I did leave a bug in there. I'll investigate tonight and post the results.

Anyway, thanks to John for his impressive work !

You're very welcome.

5593. Re: HARD DISK: HELP OFFERED AND WANTED

Newsgroup: comp.sys.atari.st
Date: 1988-09-18 20:28:10 UTC
From: bro@titan.rice.edu
Message-ID: <1893@kalliope.rice.edu>

> Oakland, CA 94620

As a result of this "phantom drive" phenomenon, you can't install ram disks since all the drive letters are spuriously taken. For this reason I wrote a little program that goes in the AUTO folder (after your hard disk driver) that reads a file to determine what YOU want the active drive mask set to. Thus, you set the active drives before running the ram disk program which can then install itself correctly. The only trouble with this scheme is that I have trouble with reset-surviving ram disks, though I am not sure why. Does a warm reset leave the drive bits alone, including the surviving ram disk? If that is the case, all I need to add is a check to see if the program is being run after a cold or a warm reset. The way I currently use it is to set the drive bits every time and use a non-surviving ram disk, so I haven't been motivated to fix it up any more. If there is an interest in the program (which can either be run from desktop, shell, or auto folder, and uses command-line arguments or a file if no arguments are found to LIST current active drives, SET the desired active drives, CLEAR the undesired active drives, print a MESSAGE, and HOLD the resulting printout until a key is pressed) I can post it to the sources and binary lists. If someone can make suggestions on how to deal better with reset-surviving ram disks, I will incorporate those changes first.

Suggestions welcome.
Thanks,
Doug Monk (bro@rice.edu)

5594. Glendale Atari Faire v.3 report(!)

Newsgroup: comp.sys.atari.st
Date: 1988-09-18 20:45:50 UTC
From: rjung@nunki.usc.edu
Message-ID: <1408@nunki.usc.edu>
Source record: 250694
Cross-posted to: comp.sys.atari.8bit,comp.sys.atari.st

Well, it's now Sunday, 9/18/88, and the Glendale Atari Faire v.3 is over.
Here's a report, for those who are interested.
(If you're not interested, I suggest you hit "n" now:)

The Glendale Faire may have been a local event, but there were a few things
that net.people would be interested in:

* SPECTRE 128. It's _here_. NOW. David Small brought 200 copies out to
Glendale, and were they selling! The price is around $180 -- Make your
checks out to "Gadgest By Small". David (a very funny and fun guy) was
accompanied by his wife Sandy, his infant son, and a few friends.
And yes, I did see Hypercard running on an ST with my own eyes. David
also gave a humorous talk on the development of the Spectre, and
denies any plans to do an Amiga emulator for the ST or a Mac emulator on
the Amiga.

* 8-bit GEM. You want to revitalize your 8-bit Atari? Then take your picks:

Obviously, the biggest expectation in the 8-bit community is GOE
(Graphics Operating Enviroment). Yes, it was at the Faire, and yes,
Total Control Systems is selling them. They're not _shipping_ until
October, but you can order it now and get a discount. It looks like a
TOTAL clone of the ST's GEM (You can even hook up an ST mouse and run
GOE through it), and ran solid for the entire show. The author says it
will run 95% of all 8-bit programs. It comes on a ICD "piggyback"
cartridge, and takes up only 8K of RAM. There's supposed to be a library
of GOE routes, so other developers can easily make GOE calls and write
GOE products. Looks really terrific.

From the makers of _Celebrity Cookbook_ comes DIAMOND OS (aka ST jr,
depending on what time of the day you were at the booth). For $30, it's a
graphics interface that offers drop-down menus, windows, and other good
stuff (it doesn't _look_ like GEM, however). Reeve Software is promising
to release DIAMOND Paint, Write, Publish, and Programmer's Kits, for $30
each as well. It looks like it's disk based (I can't be sure),
but that's okay -- it can support up to 16 megabytes(!) of RAM.

* Genlock for the ST was demonstrated, in an open-board "final" version. JRI
says they're only waiting for the FCC, and then they'll ship. It's very
impressive -- An ST Cyberpain animation was being superimposed over a
music video, and the Genlocked result was being shown on both a standard
TV _and_ the SC1224 (how do they do that?). Ready to tackle the Amiga?

* Neocept, makers of FONTZ! and WORDUP (a great word processor -- an
unsolicited endorsement) were present. Nothing major was presented,

although the new version of WordUp, with numerous minor bug fixes, is expected to ship in two weeks. Registered owners will recieve a card in the mail about the upgrade procedure. Neocept also says they'll gladly take user input for improvements for their products -- Just drop them a line.

* Animation buffs like myself will be happy to hear that FILM DIRECTOR is finally being released. Epyx has gotten the rights to this two-year-old cel-based animation program, and it has been SUBSTANTIALLY improved (16 screens for cels, runs in 512K, better user interface, etc.). It should be out in October, and the $50 price tag gets you both FILM DIRECTOR and ART DIRECTOR -- A bargain! Maurice Molyneaux (a fun guy to chat with, a real professional artist) had a lot of input into the final user interface, and it shows. I can't wait.

* Megamax was also showing their soon-to-be-released Laser DB. It's a source level debugger for Laser C, and offers lots of features -- Source-code trace viewing, register value displays, breakpoints, multiple windows. If you liked Laser C, you'll want this.

* Codehead software was also demonstrating G+PLUS (I won't say anything about this, everybody and his cousin knows about it by now) and a new product called MULTIDESK. MDesk allows you to have 16 accessories of your choice in ONE menu slot. Even better, you can clear out and load NEW accessories at any time! You can also change the name MultiDesk registers itself on the menu, so you can have six copies of Multidesk -- each one with 16 different accessories -- for a mind-numbing total of 96 accessories avaliable simultaneously. Future products promised include FatBack ("A unique hard disk backup system") and CodeHead Utilities (A collection of programs and accessories).

* ICD was present and selling their cartridge-based SPARTADOS X. My friend bought a copy ($80, on a piggyback cartridge), and it appears to work just fine. Improvements include 1000+ files per directory, faster disk access, and built-in ARC/ALFCRUNCH support. The manual is still a preliminary copy, however, but ICD promises to send out the finals to registed owners when they become available. They also showed their FA-ST hard drive, available for 8-bit or ST hookup.

* Regent Software was selling copies of REGENT WORD II for the jaw-dropping price of $15 each -- Not $15 off, $15 EACH.

* Broderbund, surprisingly, was present. They were showing their new _Typhoon Thompson_ game for the ST (known on the Apple // as _Airheart_), as well as _Star Wars_ (imported from Europe; Broderbund is distributing). A version of _Karateka_ for the ST is promised, and "maybe" _Print Shop_, but little else. (The dealer was frank in why there was less Atari support -- "Our biggest market is the //gs"). No word on 8-bit support.

* And now, the word from Atari. Conspicuous by their absence, none of the Tramiel family showed up. Instead, we were treated to Sig Hartman, who promised us that "[1989] will be a critical point for Atari in the US

market". He also apologized for the lack of more ST's in America ("We had a limited number of Ataris, and we decided to put them in West Germany -- If we didn't, there would have been a hole for the Amiga or the Macintosh to get in"), and pledged closed attention to the end users, through user groups and public information services. Sig refused to "officially" confirm/deny the existence of the Atari Transputer, the 68020/68030 workstation/machines, or anything else -- except by saying "We're working on 7 or 8 products right now, and I can't say what they are." He did promise that 520/1040 owners will be able to get TOS and blitter upgrades, and that he will personally try to get more companies to produce 8-bit titles.

In a related vein, Federated promised the increased development of "compu-centers" in all their stores, and the possibility of offering in-store servicing for Atari products. They are also supposedly toying with the idea of carrying hardware accessories (boards, wiring, etc.) in the centers.

* Pledged to appear -- but never did -- were Data Pacific and Antic. Dealers who did appear, but didn't produce anything major, included Astra systems, Michtron, Migraph, and Seymour-Radix. Bill Skurski Enterprises was present, peddling copies of his "New User's Guide to the Atari ST" (book and videotape), as well as Best Electronics, Logical Choice for Computing, Mid-Cities Comp/Soft, and Comsoft.

Special thanks to John King Tarpinian, the local user groups, ACENET, and everybody else for makign the whole thing possible.

--R.J.

5595. Re: Genie?

Newsgroup: comp.sys.atari.st
Date: 1988-09-18 22:10:38 UTC
From: jwhitnell@cup.portal.com
Message-ID: <9245@cup.portal.com>
Source record: 250695
Cross-posted to: comp.sys.mac,comp.sys.atari.st

dbw@crash.cts.com (David B. Whiteman) writes
|Genie is better than CIS in this regard -- Genie sends the entire file
|to the local node that the user is downloading from quickly, and the local node
|handles the download. CIS sends the file in packets across the entire network
|which slows the download down considerably.

I think this depends alot on what protocol you are using. With Compuserve,
the protocol of choice is CompueServe QuickB. Using QuickB, I've averaged
220 to 230+ cps on a 2400 bps line. Only during the busiest of times (6 to 8
pm here on the west cost) does it ever drop below 220. You can't get a whole
lot faster then that. I don't have number for Genie, but I don't think they
come close to that, even with the new 1K Xmodem.

5596. Spectre 128 info from Glendale Atarifest

Newsgroup: comp.sys.atari.st
Date: 1988-09-19 00:06:51 UTC
From: acm@valhalla.cs.ucla.edu
Message-ID: <16044@shemp.CS.UCLA.EDU>
Source record: 250696

A SPECTRE COMES BACK TO HAUNT APPLE
Gadgets by Small was showing Release 1.0 (?) of Spectre 128 at the "Southern California Atari Computer Faire, Version 3.0". It is now selling.
Dave Small has outdone himself again, coming out with a superior product in an incredibly short amount of time.

What warrants the word 'superior'? In addition to the things you might expect, like being 20% faster than the hardware it emulates, having a larger screen with a mono monitor, being compatible with SC1224 monitors, Translator 1, all Mack System and Finder versions, HFS, and the 128K (not to mention the 64K) ROMS, Dave's Cartridge now refreshes the screen 400% faster and writes to floppies 800% faster than the Sac. In addition, you can use Apple's own SCSI HD's with it if you want. Admittedly not a godsend to most ST owners (who would balk at Apple's prices, for one thing), but most probably useful for current Mack users who already have the HD, either at home or at work.

Where the Spectre really shocked me, though, was when I heard about its HD transfer speed, which, according to Dave's modest figures, is fully 2.5 times faster than the Mack itself. Much to the delight of the crowd at the seminar, and as you could imagine, Dave commented that Apple's ghostbusting lawyers are *furious*. I think the decision to release the Spectre now at this comparatively small Faire (as opposed to say, Comdex in the Fall) was a good way to keep the lawyers from showing up to harass him. Dave is betting that word of mouth and the networks are going to spread the news of this development further and faster than trade publicity anyway.

I almost forgot: yes, it runs hypercard (with a mere meg, even)...and pagemaker, and adobe illustrator, and...well, in Dave's own words, it is "...far more compatible" than the last mack emulator to appear on the market. Of my own first-hand experience with the setup there, its speed and its (larger screen) appearance made it subjectively very reminiscent of the feel of a monochrome Mack II.

There is a downside to everything, hard to find to be sure, but still there. Dave said that version 1.0 has a minor bug in it, but he noted that updates that contain bug fixes will be free (as usual, right?), and that update charges in the future will be smaller than what Data Pacific levied. The initial cost for the Spectre, however, will be more expensive. It is currently listing at $179.95. But my guess is that this compares favorably with Apple's charge to 'enhance' a 512K mack.

One thing that bugged me is that I didn't see anywhere a list of the software that doesn't run (the list of software that DOES run would probably be too obnoxiously big). But surely something must break? According to Dave, he said he actually finished Spectre "last Tuesday," so just maybe they haven't

had the time to compile a long impressive list suitable for printing.

A couple other things: still no support for Mack sound or MIDI. Dave said that he's working on getting the sound to work, but that at present enabling it uses up too much CPU and eventually crashes the machine (funny, I thought that the former was true of the real Mack). As for MIDI, I forgot exactly what reason he gave, but the bottom line is "no go".

Since some of you probably would have asked, here is the address that was given for ordering purposes:

Gadgets by Small, Inc.
40 W. Littleton Blvd. #210-211
Littleton, Colorado 80120

5598. News from Southern California Atari Faire

Newsgroup: comp.sys.atari.st
Date: 1988-09-19 00:14:25 UTC
From: acm@valhalla.cs.ucla.edu
Message-ID: <16045@shemp.CS.UCLA.EDU>
Source record: 250698

Report from the "Southern California Atari Computer Faire, Version 3.0"
(a.k.a. The Glendale Atarifest):

The biggest news at this show was the introduction of Spectre 128.
Check out a separate posting for info on this.

CodeHead Software was showing G+plus, a "totally compatible" GDOS replacement program, that is faster and has the added capability of reloading fonts and device drivers without rebooting. I never got to see it in action, so I couldn't verify the above statements. They were also showing MultiDesk, a program that can load up to 96 desk accessories, at any time without rebooting to load and 'unload' them. It takes up one regular acc slot. In addition, it allows the use of some sort of macro files to load in a predetermined group of up to 16 accs. at once, with few mouse clicks. They are also the authors of TopDown, the program that cuts bootup time by putting auto programs and accs at the top of memory. Their address is P.O. Box 4336, N. Hollywood, CA 91607

JRI was showing a Genlock System for the Mega ST. They had a cute animation program running on top of video from a VCR. They showed the animation program by itself in one ST monitor and the combined output in both a TV and another ST monitor. The genlocking is fully hardware based, so that no supporting software is needed (i.e. choose from whatever paint program or animation package already available), it has a lot of features I won't mention here. They are tentatively pricing the card at $500. They are currently awaiting FCC certification, and are planning similar device(s) for the low-end ST's.

Neocept was showing the WordUp wordprocessor there. As has been noted elsewhere, it was enjoying a good deal of popularity at the show, more so than the WordPerfect booth. Text routing is very sophisticated, very natural to use, and reasonably fast, as are screen updates of a window full of big fonts and pictures. The print quality is really professional, as is the screen output on a monochrome monitor. It wins hands down for ease of use over a lot of other WP type programs. For example, to include a picture along with your text, you practically just have to choose a filename, the text will automatically route around it (the picture appears right where the cursor is). Resizing or removing the picture is as easy as manipulating a miniature GEM window. The latest version has reportedly fixed the bugs in the initial release. Some of the printed pictures could have looked a bit better, though.

Practical Solutions was showing a triophonic/true stereo sound adapter board. Solderless and internal, it will be selling for $50 starting November. This, in combination with Yamaha's new 10-bit pin compatible, functionally compatible version of the sound chip (anybody know where I can get one cheap?) could open up possibilities for much better sound right out of the ST. The extra bits make a big difference. Why, just think, 6 more bits and we have CD

quality B-). Anyway, PS's Videokey composite/RF converter/audio line box goes for $120. They were also showing their mouse, monitor, and drive master boxes, all three of which simply switch safely from one set of lines to another ($40-50). They say they'll sell bulk ST floppy and monitor connectors for less than $6.00 each.

Somebody (I don't know who) was showing midi-gram, what seemed to be a microphone that converted sung notes (i.e. sounds) into midi notes (i.e. binary), for use with any sequencer for recording. Don't know if this is specifically an ST product or simply a MIDI port hookup or what.

Of the few displays only showing games at this show (maybe the only one?), there was Broderbund. Nothing to note.

Antic Software was showing the usual 3D sterotek glasses (forms a crowd, but not really that impressive, folks). I didn't get to see their new CyberSculpt, the latest of Tom Hudson's creations, so don't ask. A lot of people were showing Spectrum 512 and Cyber pics, however -- mainly to show off their monitors or monitor attachments or the speed of their hard drives and such.

Megamax was showing their Laser C compiler, announcing that by Christmas they will have LaserDB, a source debugger, available.

Seymor/Radix was showing an impressive 75,160,216,300,360,600, up to 1000 dpi image scanner. Of course, the output can be used with all major picture formats and DP programs. Their printed output looked very good.

Last but not least Atari was represented at the show. Sig Hartmann was hard to track down, so I asked Cindy Claveran if she had any info on the 68030 UNIX box, but although she was very courteous, she had no comments about any possible release date. Somebody nearby also asked about the transputer. Essentially what she said about that is that all of the prototypes are now in developers' hands. That would explain, at least, why there was no transputer to be seen there. But I didn't see 1280x960 monitors popping up anywhere either. What *did* Atari show, you ask? Pretty much their whole current product line, all the way down to the game machines, running various types of software.

5599. Damaged moriabin.arc header

Newsgroup: comp.sys.atari.st
Date: 1988-09-19 03:54:12 UTC
From: c60a-1bq@web-1a.berkeley.edu
Message-ID: <14436@agate.BERKELEY.EDU>
Source record: 250699

When I uudecoded moriabin, i found that the header file for MORIABIN.ARC was damaged. Did this happen everyehere, or am I doing something wrong? BTW, our uudecode is pretty primitive, so I had to knit the files together to decode it. I doubt this had any effect on this particular error as it occured on the 2nd file in MORIABIN.ARC

John Kawakami

5600. low cost HARDDISK interface

Newsgroup: comp.sys.atari.st
Date: 1988-09-19 03:59:20 UTC
From: V61@DHDURZ1.BITNET
Message-ID: <8809190537.AA09957@ucbvax.Berkeley.EDU>
Source record: 250700

Sorry for the long pause after my first announcement -- but there was a lot
of work to do and I wanted to collect requests.

Due to the number of requests I decided to post some articles about the Atari
DMA port and my hardware solution, because they may be of general interest.
But the software is too large - I will try to store it (as source and as
executables) at a fileserver.

In this article I want to answer some common requests:

Hardware:
- The layout can only be photocopied , there exists no machine readable
version of it.
- The assembly is very simple - there is no need of an oscilloscope ,
a voltmeter is sufficient. Nearly all hardware errors can be detected
and analysed by the software.
- General remarks to Harddisks: (My experience, my own opinion)
- there is no harm in using harddisks with short seek rates (28ms)
instead of `slow' ones (40ms) (28ms are louder than 40ms). But I
couldn't recognice any increase in access speed - the operating
system and it's access to harddisk is more important. So I suggest
to invest your money in harddisk size and not in speed.
- Someone asked if it would be possible to install a ST157 (3"1/2)
instead of the floppy in a ST1040: answer: no :
- harddisks use other mounting screws
- there won't be enough space to mount the interface with the
OMTI controller (especially if you plan or have added an 68020,
memory expansions or SRAMs instead of (E)PROMs)
- hardisks need a lot of power and the ATARI power supplies are
weak (HD-Requirement: c 2A on 12V at power-up, c1A at 5V --
critical at seek operations)

Software:
- A MINIX driver will be written immediately after I have received the
ST version. Please send me a note when you received it in Germany.
- All programs which use legal GEMDOS and BIOS calls will work with my
driver - only programs that try to access the harddisks directly won't
work (besides HD format and partion utilities only a virus would try
to access the harddisk in this manner)
Until now we haven't detected a single program that doesn't work with
our harddisk (besides the ATARI hardisk driver & formater). Even all
harddisk backup programs like Turtle,... work correctly !
(some programs have troubles with too many partitions, so we allow you
to undefine and redefine single partitions)
- The software was developped for high res. monitors - no restrictions for

the driver, but our HD utilities will not work with low res. colour monitors !!!
- Now all comments and helps are translated to English !
- The software can also be used in connection with the c't-solution (one short source file must be substituted - no multiple DMA port usage)
- The boot software exits as a disk bootable version as well as a ROM bootable version (ROM patch)
- Foreign utilities for GEMDOS speed increase and 40 folder bug solution are necessary:
FATSPEED and GEMBOOT recommended
(Thanks to Ulrich Kuebler & Konrad A. Hahn)

I think the main reason for our solution is in fact the software:
- You can make use of 8 partitions with arbitrary drive IDs (you may use K: and O: and keep C: for a RAM disk)
- You can connect several drives, several interfaces
- You can create, change, delete partitions at any time (the next version will even allow you to move,enlarge and shrink partitions)
- The drive recognition scheme is `intelligent': you are allowed to switch off drives and to reconnect them without rebooting your system
- The driver needs only about 4k of RAM (!)
- The utilities make full use of GEM
- ...

I hope that answers the most important questions. Those of you who had further special questions I will contact within the next days.

Howard Chu writes :
>Contrast this with, say, an Apollo network. Our engineering school runs over
>300 Apollos on a single Apollo token ring, on two campuses spanning over two
...
I use Apollos and am familiar with them so I found this entire passage
interesting ...

>Contrast again with an Apollo network - these machines were obviously designed
>from the start to operate in a distributed computing environment. Sun's network

Please note a fundamental difference between Sun and Apollo networking schemes.
The Apollo network is a *homogeneous* environment. Sun's are a *heterogeneous*
environment. Try sticking a silicon graphics or sun machine into their token
ring system :-) Oh, yes to make them heterogeneous you use Ethernet and
NFS...and their TCP/IP is less than wonderful ...
...
>the password database, or "registry," there is also a locally cached registry,
>which maintains a selectable history size of local users, so even if the main
>registry becomes inaccessible due to a network failure, the node can be logged
>into for use. Apollo's network management software is easily the most
>sophisticated and mature as any I've seen. And with their filesystem, you
>won't find your NFS partitions temporarily evaporating, you won't be denied
>access to files that you own, etc. (This is certainly an odd problem to
>appear in a "stateless" filesystem, but Sun NFS often gets confused and will
>deny Joe User access to NFS mounted files that Joe owns. Usually fixed by

Howard forgets about the infamous Apollo ACL problems where one day you can come
in and find that the acl cache has been corrupted and the line printer
can suddenly own you files.

>So much for keeping it short. I didn't even get to talking about how much
>faster Apollos are, how much more responsive the Apollo Display Manager is
>than any Sun windowing system, how much more sophisticated the filesystem is,
I work on Suns and Apollos and the DM doesn't strike me as faster...rather
slower overall...especially if you are working with Unix. Also Sun offers
a friendly user interface (SunView) and if you are on a 386i then you also have
an Macintosh-like finder and context sensitive help...Apollo simply doesn't
offer these things with their machine...(you might be able to buy delphi
but it doesn't compare to the hypertext Sun help).

Your DM window may come up slightly faster...but your shell prompt is slower!
Unix on Sun's is not only more robust and reliable but works....which I have
found can't be found to be the case on the Apollo. Apollo's Unix is odd to
say the least...in some cases it depends on it's proprietary Aegis system ...
I work on 9.7 and Apollo is moving to 10.0 but I have heard less then
wonderful things about that. The filesystem's dependency on ACLS can

create lots of problems with people that use Unix....ALSO on SR9.7 and prior there is *NO* process protections... i.e...as a *normal* user I can zap every process (including root processes) on every node of a 300 node ring!!! Nice.

Their are other little things...you buy a Sun and you get a C compiler (you have to buy one for Apollos), a user interface library (on Apollos you have to buy Dialog), Color Suns allow split frame buffers so that you can run a b&w desktop and a 8-bit color desktop - two environments... if you want you could run NeWS or X in one and SunView in another...(I have yet to discover how to do this ... or if you can on the Apollo)..., NeWS runs on the Suns (doesn't on the Apollo), ...

yes I develop on Apollo but I would not recommend them to a friend... the friends I have recommended Suns to are quite happy...(I like to keep my friends). When I had to sink hard $ into a workstation I bought Sun and am happy. I think Howard is definitely in the minority with his complaints about Sun...

My Opinions Are Entirely My Own.

5602. installing LARN

Newsgroup: comp.sys.atari.st
Date: 1988-09-19 04:50:19 UTC
From: David.Hochhauser@rubbs1.FIDONET.ORG
Message-ID: <57.2334A7BA@rubbs1.FIDONET.ORG>
Source record: 250602

HELP!!!!!!!!!!!

I don't know what I'm doing! I just downloaded LARN from the FIDO files. I unARCed the file LARN12S.ARC and got:
-README-
FIXED.BUG
LARN.ARC
LARN.DOC
LARN.FTN
LARN.HLP
LARN.MAZ
LARN.OPT
OLARN.HLP
OREADME
TERMCAP.ARC

Was I supposed to get a file called LARN.TTP? What do I do with LARN.ARC and TERMCAP.ARC. Do I need a special compiler? Would someone familiar with this game please contact me either on this BBS or call me at 201-932-0597. Thanx.
Sincerely
David Hochhauser

What you downloaded was the complete sources for my port of Larn 12.0 to the ST. There are no executable files in that archive. The subfile LARN.ARC has the actual source code, and TERMCAP.ARC has the source for the termcap library, as well as a description of the ST's built in VT52 emulation.

I wrote this port using Mark Williams C version 2.0. All you need to do to get a working game is unpack the files and type "make," assuming you have that compiler. If not, then you're better off getting hold of the executables. Look for a file named LARN12.ARC (note the absence of the letter 'S' in the name...) and just use that.

A lot of copies of LARN12.ARC were distributed without the termcap description included. I've posted the termcap separately to this group a few times already, so you should be able to find it at an archive site.

Has anyone else run Larn from a BBS? It will work, if you redirect all three I/O descriptors to the serial port. (Actually, it might be best to leave stderr directed to the ST console...) I suppose it's not such a hot idea, after all, since you can't limit the time someone plays for. But since it uses termcap, you can support a wide variety of terminals in the game.

>When I uudecoded moriabin, i found that the header file for MORIABIN.ARC
>was damaged. Did this happen everyehere, or am I doing something wrong?

It uudecoded fine here, but I've noticed two problems with it so
far...first, it hangs quite often on me (both when I use if from the
desk top and when I run it from gulam). I haven't made it out of the
bartering stages yet (it always hangs when I am moving between the
first screens buildings). No bombs, just nothing happening (except
hearing the keyclicks) as I press keys. The other problem is just one
of implementation. The command line options are lower case only, so
you really can't run moria as a '.ttp' file. The reason being that the
desktop uppercases all your text that you type. The workaround for
this is to simply write a little wrapper program that pexec's the
moria code with the appropriate command tail. This wrapper can also
set the SHELL variable at the the same time.

Message-ID: <3585@druhi.ATT.COM>
Source record: 250610

in article <407@stag.math.lsa.umich.edu>, dyer@math.lsa.umich.edu (Jon Brode) says:
> What's the latest word on SPECTRE 128? How is it for compatability
> (Multi-finder, Excel, Hype-Card, Full-Write, etc...) with programs
> and sound? What is the projected release date?

The Spectre 128 is a lot more compatible with the Mac than the
Magic Sac was. Multi-Finder runs, though it is something of a memory
hog (ie. a good excuse to have 4 meg) and some programs are not 100%
stable when running under it. (That's also true on the Mac, Dave hasn't
figured out which problems are Mac problems and which are Spectre 128
problems.) Excel runs just fine on the Spectre 128, not surprising
since it ran on the Magic Sac also. HyperCard runs just fine on the
Spectre as long as you have at least a meg of RAM. It's another memory
hog. I don't know about Full-Write, I've never used it and I never
asked Dave if it runs or not. The current version of the Spectre 128
doesn't support sound though it is being worked on. Dave has a test
version that does have sound but he isn't sure that it can be made
stable enough for release.

Gadgets by Small was at the Glendale Atari show this last
weekend (Friday the 16th and Saturday the 17th) with the first production
run. Phone and mail orders will be shipping in the next couple of weeks
when the next production run comes in.

You should really contact Gadgets by Small for information on
availability, I don't know if the next production run is sold out or
not. You can reach Dave at dsmall@well.UUCP. Or you can write/call:

From: mike@ncrcpx.UUCP
Message-ID: <1821752@ncrcpx.UUCP>
Source record: 250612

Last May, Ed Beers asked about using the kb command in gulam to "fix" the delete key. At the time I made a note of the request, but as I did not have gulam, it wasn't important. I did watch for a response, but I never saw it. Now I have gulam and I, too, would like my delete key to do a forward instead of a backward delete.

I am having the same problem that he did. That is "kb -(r,m,or g) 07f 1d" do not work. What is the solution ???

thanks,

mike

5613. Hard disk in 1040ST was Re: low cost HARDDISK interface

I've done this. I had to use an Atari host adaptor board (since it is the smallest), but it is quite possible, and was a hit at our local user group meeting. Might add that it was an ST157N, with imbedded SCSI. It uses the exact same holes that the 3.5" floppy does.

As Ron said, if you plan to add alot of other crud, it's not a good idea, though.

The power supply was beefed by replacing the regulators with higher capacity units, and a fan was installed to keep everything cool. Otherwise, it works great.

The power supply can't be that big of a deal because Supra sells their internal drive kits for the Mega ST, and they run off the Mega internal power supply (which happens to be the same unit in my 520STfm, but different than the one in the 1040ST the hard drive is mounted in. I bet the newer 1040STs have the same power supply).

From: martin@lakesys.UUCP
Message-ID: <1038@lakesys.UUCP>
Source record: 250614

Hello everyone!

Due to the substantial number of files now available via netlib@lakesys, a reorganization of the files will be effective as of 9/23.

All file parts will be in volumes.

Those files which did not reside in a volume previously, will be in volume0.

All GUNU C files will be in volume2.

New files will be now placed in volume3.

The new index will be the only one sent out as of 9/22. It is a good idea to get a new version of the Index to be sure you're requesting file parts that netlib will be able to find :-).

As always, send any contributions, questions or comments to me, martin@lakesys.

C.A.P.S
Computer Application and Programming Seminars

Notice of Meeting

Date: Wednesday, September 21, 1988 - 7:30 PM

Place: York University,
4700 Keele street, North York, Ontario
Petrie Science Building Rm 315.

------------------------------------------------------------------------------
ALL ARE INVITED
------------------------------------------------------------------------------
Speaker: Peter Camilleri
Topic: Lab-30 68030 Update on the Real-time computer designed and built by
P. Camilleri, T. Ivanco and A.Moise with the support of ISTS/STPL;
Also, EtherNET for the Atari/Mega ST and a look at CAD/CAM
development tools used in these projects.
Abstract:

A review of the progress of 68030 system announced last year. It's still a
PCB tiger, but a lot has changed in the interim, and the system is on the
verge of transforming from vapourware to hardware ( or maybe smokeware ).
A more recent development is a project to provide EtherNET networking for
the Atari 520,1040 and Mega class machines. A whole board for just EtherNET?
Well, NO. Optional extras include up to 6 serial ports, a centroncis port,
and an ACSI to SCSI converter. Finally a brief discussion of some of the
development tools that made the above possible. The ORCAD schematic system,
and the PADS PCB routing system.

Speaker: Avygdor Moise
Topic: - Introduction to the C programming environment (beginners) and or
Introduction to bad programming habits in C (advance)
------------------------------------------------------------------------------
--
Avygdor Moise, York University. (C.R.E.S.S.), Petrie Bldg. Rm 340,

5620. Re: SHADOW / BDT decline in sales

Newsgroup: comp.sys.atari.st
Date: 1988-09-19 23:38:44 UTC
From: uace0@uhnix2.uh.edu
Message-ID: <672@uhnix2.uh.edu>
Source record: 250620

OK, the bug you are experiencing, we believe, is caused when a program performs an RSCONF call with a value of -1 for the baud rate (often used for break, or setting flow control). To get around this, simply set the baud rate to a valid value after you encounter this problem (or before you access SHADOW).

Version 1.02 will fix this problem, and have other delightful enhancements.

>
>This is very interesting. I suppose it'll show up at ssyx and lakesys
>for us UUCP peons. :-) Which leads me to ask -- what are the system
>requirements for this program? What printers does it support?

TeX does not support any printers. It generates a special output format
that is device independent, known as the TeX DVI format. You generate
hardcopy from a dvi file by processing that file with a program written
specifically for whatever printer you need to use. There are DVI processors
for Postscript, HP Laserjets, Xerox printers, phototypesetters, you name
it. Even for direct previewing on the ST display. (DVIST, posted to the
binaries group several months ago.)

The TeX files we have archived are the source and executables for the
main TeX program(s) only, as well as a small selection of fonts. A full
TeX distribution would come with a large number of macro packages for
special formatting tasks, a larger number of fonts, the Metafont program
for designing, customizing, and converting fonts, and a small selection
of DVIxxxx programs for generating hardcopy. TeX is distributed freely
from a number of sites, but the only ones I keep track of are ftp sites.
(score.stanford.edu and june.cs.washington.edu being most notable.)

From looking thru the README, it appears this ST version was created with
MegaMax C, based on the original Web sources for TeX, run thru the Web-To-C
translator... From what I recall of this translator, it produces a much
more efficient and powerful TeX than just the straight Web to Pascal
process.

5625. mega st2 boardrevisions

Newsgroup: comp.sys.atari.st
Date: 1988-09-20 09:06:00 UTC
From: VDKOOIJ@HDETUD5.BITNET
Message-ID: <8809200935.AA08818@ucbvax.Berkeley.EDU>
Source record: 250625

Hello,

we have mega-problems using the cartridge port on our MEGA ST2 and we think it is a common problem for all MEGA's with a boardrevision higher than revision 4. We use the cartridge/ROM-port to read data from an ADC to digitize satellite WEFAX-pictures from METEOSAT. The soft- and hardware works fine on a MEGA ST2 with a revision-4 board or a 1040STf, but it crashes (with 4 bombs) on any MEGA ST2 with a revision-5 board.

Our dealer (ECD delft) and ATARI Benelux (Netherlands) couldn't help us (yet?), so we would like to ask if there is somebody on this net with enough inside knowledge to help us. We would like to find out if there is a software or hardware difference between the mentioned boardrevisions, and if so what these differences are.

Aad & Jos

5626. Another TurboDos problem

Newsgroup: comp.sys.atari.st
Date: 1988-09-20 11:43:29 UTC
From: dcw@doc.ic.ac.uk
Message-ID: <438@gould.doc.ic.ac.uk>
Source record: 250626

Recently, there have have been several messages describing some
more problems with TurboDos... I would like to describe another problem:

A friend of mine [without net access] recently bought Metacomco Pascal-2.
This uses the same [GST] linker as does Metacomco Lattice C 3.04.01,
a product which I have bought.

Well, when any Pascal program [even one as simple as "hello world"] is compiled
on an SH204 with TurboDos running, the linker reckons that the .bin file
produced by the compiler is not a valid linker format file..

After much experimentation, we found that rebooting without TurboDos
and recompiling fixed the problem...
this is irritating, however, to say the least... does anyone know why
this should happen?
All I could think of was that Pascal-2 doesn't close the .bin file down
properly??
[Whereas Lattice C does, presumably?]

Can anyone explain what's happening here?

I will happily summarise any replies I get...

Thanks..
Duncan

5627. A Hard disk problem

Newsgroup: comp.sys.atari.st
Date: 1988-09-20 11:45:13 UTC
From: dcw@doc.ic.ac.uk
Message-ID: <439@gould.doc.ic.ac.uk>
Source record: 250627

Hi there everyone,

I have a problem with my hard disk: at the recent Personal Computer [World]
Show in London, I bought the Hisoft FTL Modula-2 compiler for the ST.
[Show price, 90 quid including source level debugger and profiler and make
and resource editor]

I was happily installing this onto my SH204 hard disk, using the Desktop
to copy disk 3 of 4 when the blasted ST collapsed in a heap..
Vertical lines appeared on the screen, and I had to power off..

Sadly, the result is that the \M2\FTL directory I was installing into
is totally corrupted: if I open it with the Desktop the ST crashes again,
complete with vertical lines.
If, instead, I use Gulam and cd into the FTL subdirectory, the machine doesn't
crash, but ls reveals total garbage..

The rest of the disk is fine however.

So, what I want to do is remove the garbaged directory and start again.
What I thought might be possible is the following:

Recursively follow the directory structure, [except \M2\FTL of course]
and follow each cluster used by each file:

Mark in an array which clusters/sectors are used.

Then, when I have finished the traversal, blank the FAT entry for
every cluster/sector which the array marks as unused.

Now the crunch: I don't know enough about the FAT format to do this.
The only information I have is from an MS-DOS book "Tricks of the MS-DOS
Masters" which helpfully says "the format of the FAT is beyond the scope
of this book"... it recommends the "MS-DOS Developer's Guide" which I do not
have.

So, I wonder, would anyone care to tell me the format of the FAT table,
and any other information I might need [partition table, boot sector??]
or better yet, does anyone have source doing something similar to what
I want to do ???

[C preferred, Pascal, Modula-2 and 68k assembler acceptable, 8086 assembler
deplored but ok, if it's all you've got..]

If you care to mail me, I'll gladly post a summary of anything I get..
[post only if you can't find a path to me]

Thanks in advance, everyone...

Duncan.

>... is it absolutely necessary to have
>a monochome monitor?

You don't need a monochrome monitor for the Spectre 128, but it looks nicer. If you're using a color monitor, then grey shades are used for the screen, and the locations of the pixels are mapped to different shades (since the Mac monitor has more pixels vertically than the ST's medium resolution has). You can also hit a key and get a fully-mapped view of the top/bottom half of the screen.

--R.J.
B-)

P.S. This is the same trick the Magic Sac uses for its color monitor support.

Try the amateur radio magazine "QST" about two or three years ago. They had an article or two on demodulating and decoding some satellites for display on computers, I can't remember if it was Atari 8 bit or PCs... maybe both. If you really meant 'weather radar' I don't know where to get info (like the weather radar that the Weather Channel displays) but if you want visible light or IR photographs I believe there is still stuff going on at 130-140 MHz and certainly around 1.6 GHz where the GOES satellites transmit.
There is also WEFAX hardware available, again in amateur radio circles, which will dump directly to a printer from data presently transmitted by wire services and others. Try

Advanced Electronic Applications
P. O. Box C-2160
Lynnwood, WA 98036
(206) 775-7373

I built a system for copying ESSA and NIMBUS sattellites in the early 70's but I don't think they are running anymore, though the same modulation techniques are probably in use (NBFM with 2400 HZ subcarrier modulated to provide synch and luminance info, 200? lines/min 800? lines/frame.)

> some config programs and drivers for the printer,but none to change the
> char set. Any help? Thanks in advance.

A while ago I posted a NLQPS (Near Letter Quality & Proportional Spacing) program to one of the comp.{binaries,sources}.atari.st newsgroups. It works very well (if I may say so myself 8-) with my old Star Gemini 10X printer, which doesn't have an NLQ mode. It does a double scan of each text line in graphics mode with a very tiny linefeed inbetween (1/144 inch). The PS option can be turned off (e.g. for listings, tables).

An older version had the capability to load the characterset used dynamically from a file. I removed that option, thinking that there would be no interest. If you (and perhaps some other people too) would like that, I can add back that option. In that case there has to be added a font editor too so you can easily define a new NLQ font. Ah, perhaps a two phase project...

Leo.

P.S. To be able to use the NLQPS program, you must have a printer that can do double density graphics, and linefeeds of half a dot distance (1/144 inch), but I think today most printers can do that.

5634. Unix Windows (uw) for the Atari ST

Newsgroup: comp.sys.atari.st
Date: 1988-09-20 19:40:18 UTC
From: jparker@watvlsi.waterloo.edu
Message-ID: <4032@watvlsi.waterloo.edu>
Source record: 250634
Cross-posted to: uw.unix,comp.sys.atari.st

According to the man page for uw, the arc-encoded program and documentation for the ST version of Unix Windows is kept on watmath in

/usr/source/public/commands/uw/st/*

I had a look using 'jqperuse' and found it, but my question is how do I copy it onto my account so that I can download it to my ST...I don't have a watmath account.

Also, I noticed that the date on the man page was 1986, which makes me wonder if this is a recent version of uw. I have tried several times to get uw from fileservers but haven't got any reply...so if someone has a newer version, could they let me know.

Suggestions anyone -- James

5635. Disk Drives (floppy and hard)

Newsgroup: comp.sys.atari.st

I have had a problem with my internal floppy drive in my 1040 ST. The
top head is coming off! I noticed that there was problem when I was
getting some strange data read every once in a while. Anyway, the
small plate that the head is attached to is supposed to be glued on to
the plastic part of the head positioning mechanism. Unfortunately, the
glue isn't holding so well. Right now the top head is close to dangling.
QUESTION :
Is it OK to glue the plate back on? Since one edge of
Is it OK to glue the plate back on? Since one edge of
the plate is still on, I could place it fairly accurately at the original
place. How accurate does it have to be?
QUESTION 2 :
Is it possible to hook up an IBM XT or AT compatible
drive internally or externally to an ST? What's the difference
between and internal drive and an external drive besides the casing
and the price? What differences are there in cable connectors?
I know that the external Floppy Port on the ST takes a round cable and
the internal drive connects to the board via a long flat connector
with many more pins than an external drive connector. What are all the
extra pins for? Are they all used?

MAYBE! : Could a 1.44 meg drive be hooked up via the internal
drive connector?

note : I have had my computer for slightly over 2 years. It would make

Does anybody know how long other 3.5" drives hold up before they have
problems?

Any advice would be appreciated greatly!!

Sincerely,
Alan M. Levi

>
> Rob Carriere

I'm the one who sent the files to Steve. I downloaded the ones
that Steve posted to comp.binaries.atari.st, and they seem to work just
fine.
When you invoke the font editor (on a MONCHROME), it prompts you
for a filename (I've always used *.fed for the font files). Select one
of the font files (6 were posted by Steve) and then you should be in
business. Yes, you'll see a hand pointer. The top 3 lines of the screen
should show the WHOLE character set. On the left side is a box that shows a
magnified version of the character you're currently editing. Some sort of
on-line help should be in the box roughly around the middle of the screen.
If you don't get this, then you file is probably damaged

From: neil@cs.hw.ac.uk
Message-ID: <1971@brahma.cs.hw.ac.uk>
Source record: 250639

I was poking around in Neochrome the other day (is that illegal?) and found some more negative Line A offsets.

Screen width -$2B4 # Note: The mouse pointer is clipped by these

Screen height -$2B2

Colours -$29A

Mouse X -$258 # These change even when mouse cursor is disabled

Mouse Y -$25A

Since they are in Neochrome and work with both ROM 1.00 and 1.02 then I assume they are officially supported. Thanks to his involvement with the BIOS Dave Staugas seems to be in a rather privileged position to know all this sort of stuff. Would Atari care to comment on these locations?

Now a different topic. I have a Xebec S1410A SASI controller board connected to a Hitachi DK511 40MB disk drive. When I do a system reset the heads take quite a time (and small steps) to get back to the boot partition C. If I have accessed partion E or F the ST times out and I have to press reset again. There is no problem going from F to C during normal usage only at reset and I know from experimentation that the problem does not involve the ST hardware or host card. Is this just a quirk of the Xebec that I have to live with or does someone know of a solution?

Source record: 250640

All this talk about a dying computer is clearly by people who are either
1: unfamiliar with the European scene
2: unfriendly to the ST (have an axe to grind).

In Europe the ST is selling very well. Maybe a part of the American
problem (if it exists) is that a much larger percentage of systems sold
in the US is a color system than in Europe. The color systems are not really
very suitable to work with (in the eyes of all the people that I know who
have an Atari). This leaves the color systems as either a special purpose
system, or a games machine. If the dying approach concerns those applications
I'll not say very much. The monochrome systems that I see in use every day
are very powerful mini computers. In the shops they sell very well.
Maybe the good software never made it to the US. A sign that indicates this
is that even turbo-c for the ST was developed in Germany, not by Borland-US.

This leaves the question: why is the American preference for color so much
greater than in Europe? I posed this question a long time ago, but nobody
could come up with an explanation. Anybody has one?

Try the "rcp" (Remote CoPy) command.

From your home machine, give these commands:

```
rcp watmath.jqpublic:/usr/source/public/commands/uw/st/ReadMe .
rcp watmath.jqpublic:/usr/source/public/commands/uw/st/uw.arc .
```

5642. Atari ST VT-100 Terminal Emulator Cartridge - problems.

Newsgroup: comp.sys.atari.st
Date: 1988-09-21 12:12:33 UTC
From: achowe@watmsg.waterloo.edu
Message-ID: <20997@watmath.waterloo.edu>
Source record: 250642

*** attn: Allan Pratt

re: Atari ST VT-100 Terminal Emulator Cartridge.

Environment: Colour Mega ST 2, with SmartLink 2400 modem.

Last weekend I bought the this VT-100 Emulator from "What's This" here in Kitchener. Yesterday when our phone was reconnected to the rest of the world, I actually started trying to setup the emulator for a session. I had trouble with parity and bit settings.

In my normal communications environment I use the VT-52 emulator accessory with GEM Kermit. I set the RS232 to 7 bits, even parity, strip bit on (1 stop bit). With the accessory I have no trouble getting the modem to respond with OK. If I change parity fine. If I change to 8 bit, no parity, 1 stop nit no problem with the accessory.

Now if I plug the cartridge in and power up again, I find that the only format I can talk to the modem in is 8 bits, no parity (I assume 1 stop bit since there is no parameter in SET-UP B for it). When ever I change to 7 bits, any parity, my modem refuses to echo characters and respond with OK. I tried for an hour to get the modem to talk to the VT-100 emulator using 7 bits. No frigging luck.

Is this a bug with the cartridge program or I'm doing something wrong?

> set the SHELL variable at the the same time.

I've played this version of moria for probably about a hundred hours without a real keyboard lockup. There was a problem when I did a ".<direction>" move while confused, but it cleared itself in a few seconds. The program is so large that I wonder if there might be too much already in your machine's memory when you load it. I generally have a hard disk interface and a clock setter in the auto folder, foldr100, FATSPEED, and the control panel. ST curses is a stack hog, but the program was compiled with LOTS of stack space to allow for that.
The case problem was a really dumb oversight. It should only interfere with the use of the rogue key layout and consulting the highscores file, though. TOS ignores upper and lower case in filenames. If this bothers people enough, maybe someone (maybe me?) could come up with a binary patch. In my experience, there's rarely a sequence of 20 op-codes that can't be shortened enough to squeeze in 2 more.

I've discovered a wierd circumstance. I have some floppettes which, when I format them using Gulam's "format a:" command, get errors. But when I format them with the desktop's format menu, they work! Does this make any sense to anyone?

I have one of the old single-sided external floppette drives, if that matters.

Thanks in advance for any info.

> -s
Yes a variety of comparsions are made to CIS and their $12.50 plus surcharges
in some cases for 1200 baud connections. This does make $5.00 much cheaper.
And Genie provides many of the same services, and some CIS doesn't and of
course vice/versa.

As far as GEnie mail and the BB software, there is room for improvement,
but CIS could use some to, either method has its drawbacks if looked at
very closely. The thing about Genie is you need to take the time to learn
how to use the software effectively, there are a lot of options and it
can be quite powerful if you learn to use them to your advantage...this
means reading the manual, and getting out there and just spend some time
seeing what the commands do, and ask questions if something does not
work like you expected....most of the problems it appears is that users
of Genie that have a hard time using it come from not reading the manual,
or not taking that couple minutes to ask the questions to learn how to use it.

> will there be a charge? Second, is it absolutely necessary to have
> a monochome monitor?

You can reach Dave on the Well, try hplabs!well!dsmall, that
usually works for me.

I don't know if the upgrade to version 2.0 will be free or not.
In general upgrades to fix bugs in the code are free, upgrades that add
new features are a small fee ($10 to $20). The feature and bug fix list
for version 2.0 isn't finished yet so Dave hasn't decided what to do.

The Spectre 128 works with either the monochrome or color
monitors. A monochrome monitor is recommended since it is a *LOT* nicer
looking and easier to use. Color monitors work but they aren't
nearly as nice, the screen is smaller (640x200 instead of 640x400) and
updates to the screen are slower since the Spectre must convert the
"real" screen into the correct format for the ST color screen. If you
really want to use Mac(tm) software I'd recommend getting a monochrome
monitor.

5654. Problems with gcc.arc's: Newer version of arc?

Newsgroup: comp.sys.atari.st
Date: 1988-09-21 19:48:00 UTC
From: VCD51661@DS0RUS54.BITNET
Message-ID: <8809211050.AA00106@jade.berkeley.edu>
Source record: 250555

Recently I tried to dearchive the file gcx123.arc, belonging to
the GNU-C compiler postings. I got the following message from my
arc.ttp:
"I don't know how to handle file COPYING in archive GCX123.ARC
I think you need a newer version of ARC."
The same thing happened with all the other archieves belonging to
the GNU-C postings I got. The first thing I tried was downloading
a newer version of arc from LISTSERV at CANADA01 (BITNET, as I am
a BITNET user). The file I ordered and received was
PROG-A16 88-00152, described as "ARC.TTP ... (Repost)". It identi-
fies itself as (stuff deleted):

" System Enhancement Associates
21 New Street, Wayne NJ 07470

ARC - Archive utility, 5.12 - Atari ST

Atari ST version developed by Harvey Johnson "

which is the same as with my old arc. It also did not work, of course.
So what can I do? Is there a newer version of arc available (could
someone mail it to me if so)? Or is something wrong with the file?
Has anybody had the same problems and/or can help?
I would be glad to hear from you, netlanders!

>
> Although I don't use MWC myself, I will make a few remarks:
> 1) There is no means that I know of to supply parameters to a Gem
> program if it is started from the Desktop.

This is what "Install application" does. This is how to use it to
install (for example) GFABASIC.PRG to run *.GFA:

Select (click on) GFABASIC.PRG.

Choose the menu item "Install Application" from the Options menu.

Fill in the three blanks in the "Document Type" field with GFA.

Now, whenever you double-click a file *.GFA, GFABASIC.PRG will be run
and its command-line argument will be the name of the file you clicked.

Of course, it's up to the program (in this case, GFABASIC.PRG) to deal
with a command-line argument. GFABASIC happens to do nicely; other
programs might not. Microsoft Write, for one, does not.

There are other caveats. The "current directory" will be the directory
the file is in, not the directory the program is in, so finding your
resource file might be tricky. Put all your resource files on the root
of the boot device (Drive C: if you have a hard disk) and AES will
always find them.

Correct, it appears that all the GCC related ARC files were compressed
using Squashing instead of Crunching.

>a newer version of arc from LISTSERV at CANADA01 (BITNET, as I am

There has been one major new version for the ST since 5.12 - 5.21,
with modifications to support Squashing. (developed by lil' ol' me.... }-)

If the person in charge of the CANAD01 LISTSERV would send me a message,
I'll ship 'em off a copy of the latest ARC. I can also be reached directly
on bitnet as

Yes and no. It's not strange that a company is porting it's (good) product over to another machine. What is strange is that they didn't do this sooner. They would have their foot in the door, as the Amiga has good draw programs, but few solid DTP programs (esp. at PP's price).

5660. moria troubles /// pascal info sought

Newsgroup: comp.sys.atari.st
Date: 1988-09-21 23:17:10 UTC
From: c91a-ra@franny.Berkeley.EDU
Message-ID: <5864@pasteur.Berkeley.EDU>
Source record: 250561

This is a two parter:

I thought i had moria done all right, but no -- it won't run. It loads up, then instantly dies with two bombs, then back to the desktop. It de-arced ok here (where i got moria), but did not work. It de-arced fine at home (on the ST), but did not work. Both times, I ran it from the desktop as .TOS and .TTP (which can't work as .TTP uppercases all text).

So I figure, I'll write a prog to call moria (and maybe add options features later), but that did not work. Back to the docs. Seems I have to set env vars. Well, I was pretty sure that was not the problem, but I whipped out 68000 ST Ref (by Peel), and looked up the AES calls. Why? Because I have Personal Pascal, which does not have a built in AES library. Then set up the AES calls (C-strings etc.) complied and ran the prog. Again, this did not work.

What is going on. Should I go back over my prog caller and make sure the command tail is ok? Should this work under the desktop? In any case, moria does not work for me :-{

Which brings me to my second:AND MORE IMPORTANT QUESTION

I use OSS personal pascal. i have no C compiler.
1) has anyone used Tackle box ST? Is it any good.
2) where can I find info on how to make flawless calls to OS routines from PP. Right now, I'm winging it, mimicking the examples from OSS and using the Peel book (which is very good).
3) should I just get C? Is the level of programming I want to do easier in C?
3a) Does MWC come with the Atari Devpack? (In other words, should i get just MWC, or pay the extra $100+ for developer support?)
4) what is a good assembler? Are there any object-file converters in case the objects are not compatible?
5) in general, what are some of the best tools out there (just kidding, don't answer this one).

I have used tackle box a little and it seems ok. The documentation seems somewhat better than that in the Abacus books or the developer kit, but I have not check things carefully.

5663. Networking, ST's and Spectre 128

Newsgroup: comp.sys.atari.st
Date: 1988-09-22 02:28:09 UTC
From: bw0i+@andrew.cmu.edu
Message-ID: <YXC6Ity00XoBI940VJ@andrew.cmu.edu>
Source record: 250564

Note: I hoped to send this to David Small, but couldn't e-mail to him..

I don't know if it is even possible, but since you are making a new cartridge for the 128k ROMs, will you also be putting in AppleTalk network port in? Perhaps by putting in the Zilog chip onto the cart itself (since the chip can be bought by anyone) you would be able to get networking into the Atari series via AppleTalk. Perhaps making the Zilog chip available to the ST via. cart slot and bypassing the Mac ROMs you could also introduce high speed nets to the ST w/o using the Mac part of the cartridge? .. This way you could put a high speed port on the Spectre 128 cart itself and wouldnt have to use the Atari's hardware ports (as they are supposed to be slow compared to the AppleTalk ports) for networking.

One of the big reasons I'm asking this is because I'm at Carnegie Mellon and we have a computer net. called Andrew (as in Andrew Carnegie, MIT had a similar system called Athena I think) which is a campus wide (even in the dorm rooms) file server system. Just last year, they released a handler for the Macintosh that allows you to access the network via the AppleTalk port. (This project is a joint effort between CMU and IBM and recently Apple (using Mac II's as workstations soon)) Now the project is going to start at the University of Michigan (I think) as well and will be trying to get all kinds of computers (not just IBMs and Macs) onto the fileserver. The Andrew project is aimed towards Universities it seems.

If you could get the Spectre 128 to work with AppleTalk, then you would offer a "cheap" alternative to buying a $2000+ Mac SE and would get the business of students buying STs at colleges with the Andrew System..if the Andrew system goes over well. In addition, you could get the ST to share printers w/ Macs if necessary, send info between the two and so on.. a great aid to the ST line which has no really good networking to speak of. Having AppleTalk networking capabilities certainly won't hurt the product. eh?

Besides, it would be nice to use the laser printers in the clusters from my room.. sigh..

> I was happily installing [M2] onto my SH204 hard disk, using the Desktop
> to copy disk 3 of 4 when the blasted ST collapsed in a heap..
> Vertical lines appeared on the screen, and I had to power off..

Is it possible that the first crash was caused by an undetected floppy
media change (DS to SS) ? Than, if TOS suddenly stood in the forest,
couldn't it be that it did undefined write actions to the HD ?

>
> Sadly, the result is that the \M2\FTL directory I was installing into
> is totally corrupted: if I open it with the Desktop the ST crashes again,
> complete with vertical lines.

Was this your first experience with the TOS folder problem, in add ?

>
> The rest of the disk is fine however.

If you write to this hard disk, it wouldn't be much longer !

>
> So, what I want to do is remove the garbaged directory and start again.

The best you can do, I think, is not to write to this disk any more :-)
But, to keep being serious, wouldn't it be easier to ARC the folders you have
on your HD to floppy disks, format the HD, and reinstall the folders ?
Sure, this also would take at least 2 hours, but what about the time you
have to spend to write such a utility you plan ?

Huh ?
As I've heard, the write protection signal prohibits the write circuitry
in the floppy drive directly to write anything, so the drive would ignore
any write commands from the controller. Or am I wrong ?

From: kirchner@uklirb.UUCP
Message-ID: <2824@uklirb.UUCP>
Source record: 250572

Hello,
Today I had my unpacking day, so I also got the new DISCSCAN 1.2.
It unpacked, unarced without problems.

Then I tried it and
1. try: wrote into screen memory appr. half a text line high some strange
bits, brougth two bombs and returned to the desktop.
2. try: came up, I played a little with the menues and then wanted to quit.
with Q I got several questions about saving some database or the like,
I answered all with 'no' (since I had nothing to save) and
then I got seven or eight bombs, and the machine hang up.

It seems, this software is not very stable or reliable. I'll wait for
comments on the net before I do another try.

My equipment: 1040st, sm124-Monitor, sh204.
Software: I started DISKSCAN from the Intersect-RAMdisk (old, but reliable
and convenient) drive M:, on my Harddisk I use GEMSOFT to get
enough memory for the folders.

This may just be a warning to everybody to be carefull.

Please do not send me mail personally, send all comments to the net so
everybody gets the information. (Another reason: we get charged DM 1,10
per KB, so we may be ruined by receiving mail)

Date: 1988-09-22 16:39:00 UTC
From: jrd@STONY-BROOK.SCRC.SYMBOLICS.COM
Message-ID: <19880922163903.5.JRD@MOA.SCRC.Symbolics.COM>
Source record: 250573

I think I remember a discussion about this a while ago, but don't remember the outcome.

I believe it's necessary to save (some) registers around BIOS and XBIOS traps. The question for today is: which ones? Is there any rhyme or reason to which registers get trashed inside the trap?

A related question; am I correct in assuming that GEMDOS traps don't require register saving?

Thanks in advance for any info.

>can also hit a key and get a fully-mapped view of the top/bottom half of the
>screen.
>(rjung@sa132.usc.edu?)

Yes, you can use a color monitor with the Magic Sac or Spectre 128.
If a color monitor is all you have, however, you will not be doing yourself
a favor by purchasing one of these emulators. I know this too well from my
own experience.

The half-screen mode is too awkward to use. Manipulation of screen
objects becomes much too difficult. It is particularly disconcerting
to "lose" the mouse pointer on the other half of the screen.

The full-screen mode is also very difficult to deal with. In this mode,
half the resolution is lost, which hinders reading text. "Hinders?" Well,
come to think of it, it's painful to try . . . .

Any advantages of having the two screen modes available at the touch of a
key are negated by the loss of speed due to the remapping of the screen.
That 20% speed advantage over a Mac evaporates as soon as you start up with
a color monitor. The effective speed is probably less than a Mac with the
Sac running on a color monitor.

If you really want to see what I'm talking about, send me $150 and I'll
send you my Sac w/ROMS. 8-) (Actually, I do want to sell it, but you don't
want it if you don't have a monochrome monitor.)

Does anyone have a copy of Nethack (any version) 2.3 preferred for the Atari ST? IF there is one available could someone please send it to me directly or post a copy of it.

If the source exists could someone please send it that along as well.

5678. RE: ANIMATION QUESTION

Newsgroup: comp.sys.atari.st
Date: 1988-09-22 17:47:54 UTC
From: Robert_L._White.ESXC15@XEROX.COM
Message-ID: <880922-104812-2583@Xerox>
Source record: 250576

Thanks to all who answered my Animation Questions.
Much thanks to David M. Baggett who explained that the blurr I was getting
was in actuality strobing.

However I am now very confused about Leo De Wit's reply Re; the SetScreen
command
>I've got a copy of the book '3D Grafik Programmierung' from Data Becker.
>It suggests that SETSCREEN swaps at vbl time. ***THIS IS NOT TRUE!!!***
>(maybe you got the same impression). SETSCREEN does not wait for vbl
>to set the screen(s); only if you also change the resolution it will wait
>for vbl.

If this where true, wouldnt I sometimes see the screen change in the middle of a
screen draw, and get a noticable flicker on the screen?
I am using SetScreen and not waiting for the vertical blank, yet I do not see
any screen flicker. It sure seems that SetScreen does wait for the next VBL.

Could ATARI shed some lite on this subject PLEASE?
The Question is: Does SETSCREEN wait till the next VBL to change?

Also, David M. Baggett said there was a Animation Demo in the ARCHIVES.
I would love to get this david!
I do not have access to these archives, the only thing I seem to have access to
is a LIST SERVER in CANADA. I am on a XEROX ETHERNET account and am not very
firmiliar with GATE WAYS. Is there some way I can get at the archives?
BTW I do not have any way of using a FTP program eather.
Perhaps some kind soul could mail it to me!

Thanks to all
Robert L. White.

> This leaves the question: why is the American preference for color so much
> greater than in Europe? I posed this question a long time ago, but nobody
> could come up with an explanation. Anybody has one?

I bought an Atari 520 ST when they first came out. I wanted a good, clear monitor, so I got a monochrome monitor, which was much better than what IBM had to offer at the time. I soon discovered, however, that most of the software available in the U.S., especially the PD stuff, was not runnable on my system. After several years, I broke down and bought a color monitor so that I could run some of these programs. When I do my real computer work, I always use the monochrome monitor.

When I joined our local Atari user group, I discovered that most of the early members were former owners of 8-bit atari machines. I think all of them had color monitors and all of them loved computer games. None of the games worked on monochrome at that time. I don't know if that's the reason, but I recently heard that U.S. dealers are having a hard time finding color monitors, so the picture in the U.S. may soon change.

5682. rsrc_gaddr()

Newsgroup: comp.sys.atari.st
Date: 1988-09-23 09:19:45 UTC
From: gl8f@bessel.acc.Virginia.EDU
Message-ID: <577@hudson.acc.virginia.edu>
Source record: 250582

I would like to change the contents of a string in a dialogue. I know how to find the address of a tree, but not the string. Tree numbers are unique, but item numbers are not unique between trees. My documentation for rsrc_gaddr() only lists two inputs: the item number and the type:

```
rsrc_gaddr( 0, TREE01, &adrs ); /* works as advertised */
rsrc_gaddr( 7, MYITEM, &adrs ); /* cannot be done?! */
```

Can some expert explain the proper way to do this?

>Greg Lindahl internet: gl8f@virginia.edu
>U Va Dept. of Astronomy bitnet: gl8f@virginia.bitnet

To find the address of the string, you have to first find the address of the dialog (I'll pretend you named it DIALOG in the resource construction set), by using the call:
rsrc_gaddr(R_TREE,DIALOG,&dialog);
R_TREE is 0 like you have, and dialog is an OBJECT pointer.

If you wanted to assign the address of the string with name MYITEM to the character pointer named 'string', you could do so with the follwing assignment

string = dialog[MYITEM].ob_spec;

HELP !!!

This is the second time I've asked this question. I got no response the first time. I know someone out there knows the answer.

How do I remap the delete key in gulam? "kb -(m,g, or r) 07f 1d" does not work. This is what the documentation says to use. I really am to used to a forward deleting delete key to give it up.

thanks,

mike

5686. PRINTER RECOMMENDATIONS WANTED

Newsgroup: comp.sys.atari.st
Date: 1988-09-23 17:12:32 UTC
From: jhs@druin.ATT.COM
Message-ID: <308@druin.ATT.COM>
Source record: 250586

I have decided to actually invest in my own printer. The loaner I have from work is OK for draft quality stuff, but getting mulitiple character sets and near letter quality (NLQ) is not possible. My requirements for a printer to work with my 1040ST are fairly modest:

* Near letter quality
(This one *is* a must)

* Multiple character sets
(Must accept Publishing Partner fonts, etc.)

* Graphics capability
(I don't have a sophisticated need, but some is needed)

* Reasonable character speed in draft and NLQ modes

* Reasonable price
(under $300 is good, approaching < $200 is better)

At one point in the past, I had decided on a Panasonic 1091i(?) as having the best bang for the buck, low user hassles, etc. But as I don't really stay current, I don't know what the recommendations/views are now, so I would appreciate anyone's views (from experience). If some kind of survey or summary has been done in the recent past, a copy of that would be great.

E-mail is best so as to not clutter the net, unless, of course, there is enough general interest to make posting worthwhile.

Thanx.

Jeff Shore at {..!ihnp4}!druin!jhs

Hi folks. Here's the collected responses to my question about object formats. Since there seem to be so many around, I'm thinking about a new solution to allow my disassembler to crunch object files. Nevertheless, this info seems very useful, so here it is for you all to enjoy. Many thanks to those who have spent time in sending me a contribution. As for Edgar Roeder, I hope he will do both John Waldron and me a great pleasure by sending the better linker for the GST-BIN format (posting to one of the newsgroups would be great).

And here we go then (LIFO order) ...

******** From mcvax!stag!ardvar!krs (Kent Schumacher):

```
-------------------------- filefmt.h ------------------------

/* Laser C object file format definitions
*/

#define LMAGIC 0x0107 /* Laser C magic number */

/* Header prepended to each Laser object file.
*/
typedef struct {
long a_magic; /* magic number */

/* The file format output by the linker (GEMDOS) is identical to the
DRI object file format excepting the relocation information. The
GEMDOS loader will only relocate 32-bit references. GEMDOS
relocation information consists of a long (32-bit) word, indicating
the offset into the program of the first long word to be relocated,
followed by a series of relocation bytes (8-bit). These bytes
indicate the distance from the last offset relocated to the current
offset to be relocated. If a relocation byte is equal to 254, the
last offset is incremented, but no relocation is done. A
relocation byte of zero means end-of-relocation-information.
*/

-------------------------------- EOF ----------------------------
```

I haven't really looked at what I've sent you, If you have some
questions I can probably answer them by looking them up in the
Laser C manual. Hope it's some help...

******** From mcvax!cs.tcd.ie!jwaldron (John Waldron)

I am interested in any information on good linkers for the GST
object format. I use Lattice C 3.04 to compile a very large program and
linking it is slow. Also setting the -debug option causes a bus error.
I have a specification of the GST object format. It is in the manual of
an early version of the metacomco assembler. Using this I have written
a program which can list the modules in a library. It can also update a
particular module. However the program has no concept of references to
other modules. this means that the whole object file is input to the link,
instead of being able to use the library command in the linker to input
the modules needed only.

******** From mcvax!STONY-BROOK.SCRC.Symbolics.COM!jrd (John R. Dunning)
[]...
Ummm, unless there's a truly unbelievable coincidence, .o can mean more
than one format. GAS produces the format described in gnu-out.h, in the
gcc stuff. It's for sure different than TOS format, but also called .o.
[]...
I've got some doc somewhere on GNU format; I'll try to dig it up. I
think it's identical to that used on Sun 2's (and 3's?). It's fairly
complicated, especially when you throw in all the symbol info used by
GDB.
[]...
Well, the GNU linker is happy to do random access when linking. It's
pretty fast (tho the first time I ran it I thought my hard disk was
having a seizure; 28ms avg seek time, and LD was running it as fast as
it would go !)

The format of OLB files as used by GNU is something I whipped up (see
ar.h). In general, there's a header for the whole library, and a
per-element header that describes each elt; ie date, size etc. The elts
are just object files.
[]...
Well, if you arrange to disassemble GNU object files, it's trivial to
hack library elements. The GNU stuff comes with a module called
ARSCAN.C that you build into any program that wants to grok library
elements. You tell it which elt you want, and it finds it and sets you
up with a handle that you can then read from just as you would read from
an ordinary file handle.

******** From mcvax!sbsvax!roeder (Edgar Roeder)

In the german magazine ST-Computer (i think 3/88) they have published a better
linker for the GST-BIN format. And of course there they described the exact
format. I have the source on disk and can e-mail or post it.

******** From mcvax!market.alliant.com!rosenkra (Bill Rosenkranz)

here is the format for alcyon .o and archive (ar68) files as best as i can figure it out.

archives (alcyon):
---
each file starts with the magic number 0xFF65. it appears only once (first 2 bytes of file). each file is headed by:

```
struct arfhdr
{
char ar_name[12];
long ar_dum1; /* probably date (always 0x00000000) */
int ar_dum2; /* probably uid (always 0x0000) */
int ar_dum3; /* probably gid (always 0x0000) */
int ar_mode; /* most always 0x0000, not used */
long ar_size;
int ar_dum4; /* always 0x0000 (prob. ARFMAG) */
}
```

the "ar_dumn" entries always seem to be 0x0000 (in every archive i have). they probably contain date (long), uid (0x0000), gid (0x0000), and mode (0x0000) but are never used by ar68 (seemingly). i do have some atari-supplied archive with the mode field non-zero, but it is always rw-rw-rw- (0x01B6) and never really used by ar68.

following the header for each file is the actual .o (or any other file) file.

archives (MWC):
---
each file starts with the magic number 0177535. it appears only once (first 2 bytes of file...i don't know what format it is, probably a binary 16-bit word). each file is headed by:

```
struct arfhdr
{
char ar_name[14];
long ar_date; /* time inserted */
short ar_gid; /* group id */
short ar_uid; /* user id */
short ar_mode; /* mode */
long ar_size;
}
```

immediately following the header for each file is the actual ar_size bytes of the .o (or any other file) file.

object (.o) mods (alcyon):
---
these seem to have the same format as .prg files. the general layout is:

```
header
text
data
symbols
```

```
fixup (relocation) bits

the header struct looks like this:

struct exec
{
int a_magic; /* "magic" number */
long a_text; /* size of text segment */
long a_data; /* size of data segment */
long a_bss; /* size of bss segment */
long a_syms; /* size of symbol table */
long a_resv1; /* (Reserved, always 0) */
long a_beg; /* start of text/prog exec */
int a_relbits; /* rel bits flag (0 if yes) */
/* text segment follows im- */
/* mediately after this */

};

#define SHSIZE 28 /* hdr size */
#define AMAGIC 0x601A /* 2 types, a for contiguous */
#define BMAGIC 0x601B /* b for noncontiguous */

symbols look like this:

struct nlist
{
char n_name[8]; /* symbol name */
int n_type; /* symbol type */
long n_value; /* symbol value */

};

/*
* symbol type values
*/
#define N_TYPE 0xFF00 /* mask for all the type bits */
#define N_DEFINED 0x8000
#define N_EQUATED 0x4000
#define N_GLOBAL 0x2000
#define N_EQREG 0x1000
#define N_EXTERN 0x0800
#define N_DATAREL 0x0400
#define N_TEXTREL 0x0200
#define N_BSSREL 0x0100
#define N_UNDF 0x0000 /* undefined */
#define N_FN 0x0001 /* file name symbol */

relocation bits exist if the header relbits value is 0. if non zero, they
do not exist. one word of reloc info exists for each word in the text segm.
(extern references and addr constants).

each rel word is 16 bits. LS bits (0-2) are:
```

```
00 no rel info, reference is absolute
01 ref relative to base addr of data segment
02 ref relative to base addr of text segment
03 ref relative to base addr of bss
04 references undefined symbol
05 ref upper word of a longword; next rel word holds value
determining whether ref is absolute or dependent on bas add
of text or data deg or the bss
06 16-bit PC-relative ref
07 indicates 1st word of instruction, which does not require
relocation info

remaining bits (3-15) not used unless prog ref to extern. in that case, these
are index into symbol tbl. entries in symbol tbl are sequentially numbered
starting with 0.

here is a small example:

/*------------------------------*/
/* wait_ms */
/*------------------------------*/

#define MSLOOP 125

wait_ms (ms)
int ms;
{

/*
* wait prescribed number of miliseconds (approx).
* inner loop takes about 1 ms on normal ST.
*/

int i;

if (ms <= 0)
return;

for ( ; ms > 0; ms--)
for (i = MSLOOP; i > 0; i--)
;

return;
}

a dump of the .o file is:

file: WAIT_MS.O size: 298

rec# ro filoff hex dump ascii dump

From: mberkley@watnext.waterloo.edu
Message-ID: <5969@watcgl.waterloo.edu>
Source record: 250588

```
Uniterm 2.0D is available for rcp from trillium:/tmp/univ20d.arc.

Major changes include:

- fixups and improvement in the Dialer code (eg., you can have
one dialer entry for sytek1200 and another for sytek2400. Uniterm
will set the correct baud rate before dialing).

- vt300 style status line. The 50th line (25th for colour)
of the screen can be made into a host-writable status line so
that if you want to run sysline, you don't have to use
scrolling regions ala vt100.

I've made modifications to my uniterm termcap to use the new status
line feature. If anyone wants a copy, send me mail.

Don't be snide. Atari *has* commented on these locations. They are
documented in S.A.L.A.D., the new Line-A document (by Jim Eisenstein and
Mark Jansen). If you are a developer and would like a copy, call or
write Cindy Claveran, of Developer Support. I believe the document is
also in the developer-only areas of some online services, like
CompuServe and GEnie. (If it isn't, I'm sorry -- I'm not sure.)

> without the blitter?

We have already enumerated the changes here on the net. There are a new features on the Desktop, and performance improvements in GEMDOS. Most notably, the "40-folder limit" has almost gone away, Malloc has been vastly improved, and some disk I/O is much faster. (Ever say "show info" on a 16MB partition? Takes ~10 seconds, doesn't it? Now it takes less than one, and even less if the FAT is already cached.)

[]

It is all written in the Abacus "ST Internals" (and other places).
I don't have it in front of me now, but more or less: (X)BIOS
trap routines return their result in D0, and may also mess up
D1, A0 and A1. In some rare case I sort of remember D2 or A2 being
affected. Thus, if you save D1, D2, A0, A1 and A2 before a BIOS
trap, and restore them later, you're quite safe. If you write
an interrupt handler you do the opposite: save D2-D7/A1-A6 at the
start and restore before returning.

WHEN I CONVERTED FROM SINGLE TO DOUBLE-SIDED DRIVES ON MY
520STFM I USED REGULAR IBM-TYPE DRIVES.
I HAVE TWO 3 1/2" AND ONE 5 1/4"(FOR PC DITTO).I DECIDED TO MOUNT
ALL THE DRIVES EXTERNALLY.THE THREE DRIVES ARE POWERED
BY AN OLD IBM POWER SUPPLY WHICH I OBTAINED WHEN A FRIEND
UPGRADED HIS PC TO A HEAVIER POWER SUPPLY.

AS FAR AS HOOKING UP THE DRIVES,DRIVE ZERO WAS EASY.JUST EXTEND
THE RIBBON CABLE FROM INSIDE AND PLUG IT DIRECTLY ONTO THE NEW
DRIVE.THE PINOUT IS THE SAME.YOU WILL PROBOBLY HAVE TO REMOVE
THE TERMINATING RESISTOR PACK FROM THE DRIVE AND I ALSO FOUND
THAT I HAD TO REMOVE THE TERMINATING RESISTOR FOR THE DRIVE SELECT
LINE WHICH WAS A SINGLE OHM RESISTOR.THIS MAY BE DIFFICULT
TO FIND BUT IF YOU HAVE A TECHNICIATYPE FRIEND HE MAY BE ABLE
TO HELP.IT'S QUITE EASY WITH AN OHMETER ON THE DRIVE SELECT PIN.

FOR DRIVE 1 I MADE A CONVERSION CABLE FROM THAT FUNNY ROUND
CONNECTOR TO A 34 PIN EDGE CONNECTOR.THE PINOUTS ARE AS
FOLLOWS

ATARI--------1--READ DATA--------------30------EDGE CONNECTOR
2--SIDE 0 SELECT-------32
3--LOGIC GROUND-----------ANY ODD NUMBER
4--INDEX PULSE------------8
5--DRIVE 0 SELECT---------10
6DRIVE 1 SELECT---------12
7--LOGIC GROUND-----------ANY ODD NUMBER
8--MOTOR ON---------------16
9--DIRECTION IN-----------18
10-STEP-------------------20
11-WRITE DATA-------------22
12-WRITE GATE-------------24
13-TRACK 0----------------26
14-WRITE PROTECT----------28

I HOPE THIS IS OF SOME HELP TO YOU.

AS FAR AS GLUEING THE HEAD BACK ON YOUR ORIGINAL DRIVE,I
PERSONALLY,WOULD JUNK IT.THE SLIGHTEST BIT OF GLUE
BETWEEN THE HEAD AND THE GIMBAL WOULD MAKE THE HEAD RIDE
AT AN ANGLE TO THE DISK,CAUSING TROUBLE.BUT THEN AGAIN
MAYBE LESS TROUBLE THAN A LOOSE HEAD.YOU WOULD CERTAINLY
NEED TO CHECK THE ALIGNMENT AFTER THIS DELICATE OPERATION.

GOOD LUCK.

> be bought by anyone) you would be able to get networking into the Atari series
> via AppleTalk.

It isn't very hard to place a Zilog SCC on a cartridge for the
ST. It can even be made to function as an AppleTalk interface. But
there are some large problems with using it, expecially at higher speeds.

The STs cartridge port was designed only to support ROMs. There
is no write line or interrupt lines on the connector. With a little
fiddling it is possible to write data to the port, basicly you use the
address lines as data lines. As far as I know there is no simple way to
get interrupts from the port without hardware modifications.

AppleTalk runs at about 230Kbps which is about 28K bytes per
second. On the Mac the SCC is setup to interrupt the CPU every time a
data byte has arrived and it also interrupts the CPU when it needs
another byte for transmission. So in the worst case the CPU could be
interrupted 56K times per second, assuming you are transmitting and
receiving data at the same time (something that is never true as far as
I know). The majority of the time the link is idle so the CPU is not
being interrupted. So on the Mac when you use AppleTalk you use up a lot
of the CPU servicing the port. Users don't notice this since most of
the time they aren't using AppleTalk, and when they are they aren't
doing anything else (I'm ignoring Multi-Finder for now).

If you have an SCC connected to the STs cartridge port it can
not be interrupt driven, it must be polled by the CPU on a regular
basis so that it can detect incoming data. So you need to setup one of
the hardware timers to interrupt the CPU 28K times per second (actually
it needs to be at least 50% faster than that in order to be sure no
data is lost) so it can check if a data byte has arrived and if it needs
to feed the transmitter another byte. This would occur *ALL* of the
time, whether or not the AppleTalk link is active. This would slow down
the Spectre 128 a lot, maybe even make it unusable.

Unfortunately this means the cartridge port isn't a reasonable
method of connecting a high speed (230Kbps) device to the ST. The only
reasonable alternatives are the DMA port and the parallel port and the

Mega ST expansion port. The DMA and parallel ports have some problems
which may or may not be fixable. The best alternative is the Mega
expansion port, but that won't help most ST owners.

I'm not saying that you can't hook an ST to AppleTalk. I'm just
saying that no one has come up with a reasonable and affordable method.
Yet.

5694. RE:DI DRIVES (F AND H)

Newsgroup: comp.sys.atari.st
Date: 1988-09-23 22:07:24 UTC
From: 42_145@uwovax.uwo.ca
Message-ID: <690@uwovax.uwo.ca>
Source record: 250594

I use three IBM type drives on my Atari STFM
Two 3 1/2" and one 5 1/4" for PC DITTO.Drive zero plugs
directly into an extended cable from inside my ST,using
a standard 34 pin edge connector.For drive 1 I made
a cable from that funny round connector to a 34 pin
edge connector.(no,all the pins aren't used)
The drives are powered with an old IBM power supply
which I obtained when a friend upgraded his system to
a heaftier power supply.When using these drives you will
have to remove the terminating resistor pack and
probobly also have to remove the terminating resistor
for the drive select li (150 ohm).
The pinouts for the atari connector are as
follows

ATARI-----1--read data-------------30------34 pin conn.
2--side 0 select---------32
3--logic ground----------any odd number
4--index pulse-----------8
5--drive 0 select--------10
6--drive 1 select--------12
7--logic ground----------any odd number
8--motor on--------------16
9--direction in----------18
10--step-----------------20
11--write data------------22
12--write gate------------24
13--track 0---------------26
14--write protect---------28

If you have a technician-type friend he should be able to
help you with this.

As far as gluing the head back on your drive.what have you
got to loose?It's no good like it is and it would be too
expensive to get the heads replaced.Give it a t and just
pray that you don't get it out of alignment.

I,personally,would scrap it. But you might be lucky.

Good luck

RIC

5695. Latest Picture Formats List

Newsgroup: comp.sys.atari.st
Date: 1988-09-23 22:22:26 UTC
From: dmb@TIS.COM

```
Welcome to another episode of "Fun with ST Picture Formats"!
Tiny and Neo Animation have been revised and are now surely
_completely_ correct (famous last words). Thanks to Jim McCabe
and Neil Forsyth for working these out.
The Animatic Film format has been added as well.

Introductory information
------------------------
word = 2 bytes
long = 4 bytes
palette = Hardware color palette, stored as 16 words. First word is
color register zero (background), last word is color register
15. Each word has the form:

Bit: (MSB) 15 14 13 12 11 10 09 08 07 06 05 04 03 02 01 00 (LSB)
-- -- -- -- -- -- -- -- -- -- -- -- -- -- -- --
0 0 0 0 0 R2 R1 R0 0 G2 G1 G0 0 B2 B1 B0

R2 = MSB of red intensity
R0 = LSB of red intensity

G2 = MSB of green intensity
G0 = LSB of green intensity

B2 = MSB of blue intensity
B0 = LSB of blue intensity

Intensity ranges from 0 (color not present) to 7 (highest
intensity).

Example: { red = 7, green = 3, blue = 5 } -> 0735 (hex)
```

Caveat: It is wise to mask off the upper four bits of each
palette entry, since a few programs store special
information there (most notably Art Studio).

The Formats

<NEOChrome>

1 long resolution (0 = low res, 1 = medium res, 2 = high res)
16 words palette
12 bytes filename (" . ")
1 byte Left color animation limit (starting color number)
1 byte Right color animation limit (ending color number)
1 byte color rotation speed
1 byte color rotation direction
1 word color rotation duration (number of iterations)
18 longs reserved for expansion
16000 words picture data (screen memory)

32128 bytes total

<NEOChrome Animation>

NOTE: To get this feature on versions 0.9 and later select the Grabber
icon and click the both mouse buttons in the eye of the second R in
the word GRABBER.
Interestingly enough, some versions of NEO only require you
to press the right button, not both. Hmmm...

1 long magic number BABEEBEA (hex) (seems to be ignored)
1 word width of sprite in bytes (always divisible by 8)
1 word height of sprite in scan lines
1 word size of sprite in bytes + 10 (!)
1 word x coordinate of sprite (must be divisible by 16) - 1
1 word y coordinate of sprite - 1
1 word number of frames
1 word animation speed (larger means slower)
1 long reserved; should be zero
----
22 bytes total for header

? words sprite image data (words of screen memory) for each sprite,
in order

<DEGAS>

1 word resolution (0 = low res, 1 = medium res, 2 = high res)
Other bits may be used in the future; use a simple bit
test rather than checking for specific word values.
16 words palette
16000 words picture data (screen memory)

32034 bytes total

<DEGAS Elite (Uncompressed)>

1 word resolution (0 = low res, 1 = medium res, 2 = high res)
Other bits may be used in the future; use a simple bit
test rather than checking for specific word values.
16 words palette
16000 words picture data (screen memory)
4 words left color animtion limit table (starting color numbers)
4 words right color animation limit table (ending color numbers)
4 words animation channel direction flag (0 = left, 1 = off, 2 = right)
4 words animation channel delay in 1/60's of a second. [0 - 128]

32066 bytes total

<DEGAS Elite (Compressed)>

1 word resolution (same as Degas, but high order bit is set;
i.e., hex 8000 = low res, hex 8001 = medium res,
hex 8002 = high res). Other bits may be used in the
future; use a simple bit test rather than checking
for specific word values.
16 words palette
< 32000 bytes control bytes
4 words left color animtion limit table (starting color numbers)
4 words right color animation limit table (ending color numbers)
4 words animation channel direction flag (0 = left, 1 = off, 2 = right)
4 words animation channel delay in 1/60's of a second. [0 - 128]

< 32066 bytes total

Control byte meanings:

For a given control byte, x:

0 <= x <= 127 Use the next x + 1 bytes literally (no repetition)
-127 <= x <= -1 Use the next byte -x + 1 times
-128 No operation (ignore)

Compression Scheme:

Each scan line is compressed separately; i.e., all data for a given
scan line appears before any data for the next scan line. The scan lines
are specified from top to bottom (i.e., 0 is first). For each scan line,
all the data for a given bit plane appears before any data for the next
higher order bit plane.
To clarify: The first data in the file will be the data for the lowest
order bit plane of scan line zero, followed by the data for the next higher
order bit plane of scan line zero, etc., until all bit planes have been
specified for scan line zero. The next data in the file will be the data
for the lowest order bit plane of scan line one, followed by the data for
the next higher order bit plane of scan line one, etc., until all bit planes
have been specified for all scan lines.

<C.O.L.R. Object Editor Mural>

16000 words picture data (screen memory)
(palettes are stored in separate files)

32000 bytes total

<Tiny>

1 byte resolution (same as NEO, but +3 indicates rotation
information also follows)

If resolution > 2 {
1 byte left and right color animation limits. High 4 bits
hold left (start) limit; low 4 bits hold right (end)
limit
1 byte direction and speed of color animation (negative value
indicates left, positive indicates right, absolute value
is delay in 1/60's of a second.
1 word color rotation duration (number of iterations)
}

16 words palette
1 word number of control bytes
1 word number of data words
3-10667 bytes control bytes
1-16000 words data words

42-32044 bytes total

Control byte meanings:

For a given control byte, x:

x < 0 Absolute value specifies the number of unique words to
take from the data section (from 1 to 127)
x = 0 1 word is taken from the control section which specifies
the number of times to repeat the next data word (from
128 to 32767)
x = 1 1 word is taken from the control section which specifies
the number of unique words to be taken from the data
section (from 128 - 32767)
x > 1 Specifies the number of times to repeat the next word
taken from the data section (from 2 to 127)

Format of expanded data:

The expanded data is not screen memory bitmap data; the bitplanes are
separated and presented in columns. All the data for a given bitplane
appears before the data for the next bitplane. The data for each
bitplane appears as a sequence of columns, where a column consists of
one specific word taken from each line. For example, column 1 consists
of word 1 on scanline 1 followed by word 1 on scanline 2, etc.,
followed by word 1 on scanline 200.
To illustrate: The first data in the file will be the data for
bitplane 1, which consists of columns 1, 5, 9, etc., in order. The

next data will be the data for bitplane 2, which consists of columns 2,
6, 10, etc., in order.

<Spectrum 512 (Uncompressed)>

80 words first scan line of picture (unused) -- should be zeroes
15920 words picture data (screen memory) for scan lines 1 through 199
9552 words 3 palettes for each scan line (the top scan line is
not included because Spectrum 512 can't display it)

51104 bytes total

<Spectrum 512 (Compressed)>

1 word 5350 (hex) ("SP")
1 word 0 (reserved for future use)
1 long length of data bit map
1 long length of color bit map
<= 32092 bytes compressed data bit map
<= 17910 bytes compressed color bit map

< 50014 bytes total

Data compression:

Compression is via a modified run length encoding (RLE) scheme. The
data map is stored as a sequence of records. Each record consists of a
header byte followed by one or more data bytes. The meaning of the header
byte is as follows:

For a given header byte, x:

0 <= x < 127 Use the next x + 1 bytes literally (no repetition)
-128 <= x < 0 Use the next byte -x + 2 times

The data appears in the following order:

1. Picture data, bit plane 0, scan lines 1 - 199
2. Picture data, bit plane 1, scan lines 1 - 199
3. Picture data, bit plane 2, scan lines 1 - 199
4. Picture data, bit plane 3, scan lines 1 - 199

Decompression of data ends when 31840 data bytes have been used.

Color map compression:

Each 16-word palette is compressed separately. There are three
palettes for each scan line (597 total). The color map is stored as a
sequence of records. Each record starts with a 1-word bit vector which
specifies which of the 16 palette entries are included in the data
following the bit vector (1 = included, 0 = not included; i.e., stays
the same). The least significant bit of the bit vector refers to
palette entry zero, while the most significant bit refers to palette
entry 15. Bit 15 must be zero, since Spectrum 512 does not use palette

entry 15. Bit 0 should also be zero, since Spectrum 512 always makes the
background color black.
The words specifying the values for the palette entries indicated in
the bit vector follow the bit vector itself, in order (0 - 15).

<Animatic Film>

1 word number of frames
16 words palette
1 word speed (0 - 99; higher value is faster)
1 word direction (0 = forwards, 1 = backwards)
1 word end action (what to do after the last frame)
0 = pause, then repeat from beginning
1 = immediately repeat from beginning
2 = reverse
1 word width of film in pixels
1 word height of film in pixels
1 word version number (major)
1 word version number (minor)
1 long magic number 27182818 (hex)
3 longs reserved (should be all zeros)
----
32 words total for header

? words image data (words of screen memory) for each frame, in order

<MacPaint>

header {
1 long version number (if zero, entire header is ignored)
38 * 2 longs pattern data (anyone know how to use this?)
51 longs reserved
}
< 51200 bytes compressed bitmap data

< 51716 bytes total

Bitmap compression:

The bitmap data is for a 576 pixel by 720 pixel monochrome image.
The data is stored as a sequence of records. Each record consists of a
control byte followed by one or more data bytes. The meaning of the
control byte is as follows:

For a given control byte, x:

0 < x < 127 Use the next x + 1 bytes literally (no repetition)
-128 <= x <= 0 Use the next byte -x + 1 times

There are 72 bytes per scan line. Each bit represents one pixel; 0 = white,
1 = black.

Well, my masking tape operation on my ST internal drive was only temporary.
I'm getting more bombs than I was before. I'm still looking for advice on
the reparation of it.
-Alan M. Levi

5697. Where's Dr. T?

Newsgroup: comp.sys.atari.st
Date: 1988-09-24 01:13:14 UTC
From: FXDDR@ALASKA.BITNET
Message-ID: <8809240041.AA08784@ucbvax.Berkeley.EDU>
Source record: 250597

The local Atari store normally only carries MIDI Recording Studio (MRS). I asked them what else they could come up with from Dr. T and they checked their master list and found MRS, Keyboard Controlled Synthesizer (KCS), and Fingers. Nothing more.

So I wrote to Dr. T and asked about distributors. Got a brochure back listing a dozen ST programs, but no prices or where to get them from.

So I started calling places listed in the magazines. They had various combinations of MRS, KCS, and Fingers. Even places that listed other titles in their ads said that those three were all they had in stock. For example, ComputAbility lists a bunch of Dr. T titles but when I called they said they were "just picking up the Dr. T line" and only had MRS and KCS in stock.

Finally I gave up and ordered Fingers from ST-Plus. That's $34.95, the man on the phone said. When it got here, the bill was $60.00 (!!!) and the price sticker on the box said $75 (!!!!).

Does anybody know of a reliable source for this stuff? I got started with Dr. T because it looked like there was a lot of room for growth...but if I can't get ahold of it, it isn't much good. Maybe time to check out somebody else's line of MIDI software.

I'd also like to know if anybody has seen any sign of "Keys!" (the one Dr. T has been advertising in all the magazines recently).

Thanks,

Don Rice

5698. AutoCad file compatibles

Newsgroup: comp.sys.atari.st
Date: 1988-09-24 01:23:40 UTC
From: FXDDR@ALASKA.BITNET
Message-ID: <8809240127.AA09657@ucbvax.Berkeley.EDU>
Source record: 250598

And on the subject of unseen new products, what about DynaCADD? They have splashy ads, but is the software any good? I'm interested in finding a decent drafting program that can turn out AutoCad DXF files, because it turns out that various gadgets use them, such as this automatic milling machine they have downstairs. Put in an AutoCad representation of a printed circuit board and it drills all the holes in it automatically.
Anyway, what caught my attention was their trade-in offer...I've got FirstCadd and never use it because it has the look and feel of a typical PC program.
Anyway, any comments about the program or suggestions on alternatives are more than welcome.
Thanks,
Don Rice

Have you tried MicrOtyme? They're the most reliable mail order house for the ST that I've been able to find. They seem to know what they're doing, they know what they have and they know whether they have the current version of something; this is not the case with other mail order houses I've ordered ST stuff from. I believe that they have a fairly good selection of MIDI software, so I would think there's a good chance they would have at least some of the programs you're looking for. Their phone #s and address is:

4049 Marshall Road
Dayton, Ohio 45429

1-800-255-5835
513-294-6236

You also might try to find a music store in a large city (probably LA or NY) that sells ST MIDI stuff.

BTW, the only connection I have with MicrOtyme is as a satisfied customer who's tired of mail order houses that don't know what they have, whether it's for mono or color, whether it's the current version, how to read, etc., etc...

[ ]...

Of course, I forgot this one (see however STaccato, where I use it myself).
However, this is only a very limited parameter passing mechanism:
- it only allows for passing one string argument
- this argument has to be a filename.
- if you want to do different things to a file (e.g. edit/print) this
allows for only one "Install Application".

Summary: It is nice where you can use it, but rather restricted.

B.T.W. Talking about command-line arguments, is there any chance we can
have real large ones in the future? The current limit is rather low.
Looking at Pexec this shouldn't be hard to implement, since
a) for the environment this tactic is already followed, i.e. a
separately space is allocated and a pointer to it put in the basepage.
b) When starting a program, a basepage vector is already made to
point to the command-line argument (basepage + 0x80). This vector now
seems to be used as the DTA pointer. The new startup code can make a
copy of this pointer.
c) To keep existing programs happy, the new Pexec should still copy
the first 128 bytes or so of the argument string to the old command line
space (basepage + 0x80).
Is there any chance this could get into a next ROM release, Allan?
TOS 1.5 ?

>>to set the screen(s); only if you also change the resolution it will wait
>>for vbl.
>
>If this where true, wouldnt I sometimes see the screen change in the middle of a
>screen draw, and get a noticable flicker on the screen?

Probably not. I'm not a ST hardware specialist, but changing the
physical screen address (by moving values into some I/O addresses) has
as effect that the start value of the video counter in the SHIFTER gets
changed, not the current value. Not until the next vbl the current
value of the video counter gets refilled with this start value. This
means that the effect of SETSCREEN (changing physical screen location
in this case) only takes place long after SETSCREEN has finished (that
is, if you find one-hundreds of seconds long 8-). All this means
there's absolutely no need for SETSCREEN to wait. And so it doesn't.

There *IS* however a slight problem with this scheme. Consider the
following:
You use two screens, one to paint in (the 'logical' one), one to show
(the 'physical' one). Having created your image in the logical screen,
you swap the screens, using SETSCREEN. But, as stated above, the video
counter is still (until the next vbl) generating addresses for the old
physical screen; so reading is done from the new logical screen. If you
happen to update that part of the screen by using graphic functions
(they all use the logical screen) you may notice some flicker (I have
in some animation program of mine, using SETSCREEN). It all depends on
how fast, where and how you are updating things, and the difference
between the old and the new image. If it is a real problem, you can do
two things:
a) explicitly wait for a vbl; I wouldn't recommend it, since it may
slow things down too much for a real nice animation.
b) use a circular buffer of screens, which you handle in the following
way: set the new logical screen to the next screen of the buffer, the
new physical screen to the old logical screen. The afore mentioned
problem can still appear if you're updating screens so fast that you
need all screens as a logical screen within two vbl's, in which case
you can consider adding another screen to the buffer or doing a) which

will take less time this time. However, I think a circular buffer of
three screens will suffice in most cases.

>I am using SetScreen and not waiting for the vertical blank, yet I do not see
>any screen flicker. It sure seems that SetScreen does wait for the next VBL.
>
>Could ATARI shed some lite on this subject PLEASE?
>The Question is: Does SETSCREEN wait till the next VBL to change?

Maybe this small example program will convince you:

```
----------------- s t a r t s h e r e ------------------
/* scrtest */
#include "osbind.h"

main(argc,argv)
int argc;
char **argv;
{
int i;
long scr;

scr = Logbase();
for (i = atoi(argv[1]); i > 0; --i) {
Setscreen(scr,scr,-1);
}
}
----------------- e n d s h e r e ------------------
```

(b.t.w. you can also set the screen to a real different value, in case you
think this matters. It makes no difference).

Run it once with an argument of 0 (to measure the load time of the program).
Run it now with an argument of 6000; this executes in about 1 second longer
than the first time (medium resolution monitor).
Now if Setscreen waited for a vbl, this would mean there were 6000 vbl per
second, which is way off. An execution time of over a minute would have
been more appropriate.

B.T.W. this is not how I found this out; both looking into the ROM and the
old disk TOS revealed this. So it seems pretty well founded.

Leo.

5702. Re: Writing to write protected disks?

Newsgroup: comp.sys.atari.st
Date: 1988-09-24 14:38:07 UTC
From: angles@cs.glasgow.ac.uk
Message-ID: <1659@crete.cs.glasgow.ac.uk>
Source record: 250502

Unfortunately I am not able to write a program to write to write-
protected disks yet. Even when I do write such a program I will not
divulge this information to anyone on the grounds that I hate virusses,
and if there is a virus that could write to anything then imagine the
consequences.
In truth it is possible to bypass almost all the hardware interrupts
on the ST by disabling them or catching them before the OS catches them.
The only reasonable use I can see for writing to write-protected
disks is in copy protection. But then again copy protection does not stop
piracy, and is only there to enhance the bad feeling between the consumer
and the software house.

Wow..my first bug report for DISKSCAN. It has never bombed for me (at least the released version hasn't).

>Software: I started DISKSCAN from the Intersect-RAMdisk (old, but reliable
> and convenient) drive M:, on my Harddisk I use GEMSOFT to get
> enough memory for the folders.

How much free memory do you have left over after you set up drive M and GEMSOFT starts up? DISKCAN 1.2 is quite a memory hog, since I decided to use static arrays for speed reasons (I just grabbed my structure from HDSCAN.) In any case, it shouldn't bomb, since at the only place I do any malloc's (during floppy scanning), I check to ensure that there is enough free memory. One note of warning. NEODESK (at least the first version that we bought) does something illegal, since neither HDSCAN or DISKSCAN can access the floppy from NEODESK (you will get one of those 'disk damaged' messages) and both of my programs are using normal rwabs calls (and interpreting the floppy FAT as per the specs). If I can find my old copy of the Intersect Ramdisk, I will do some testing. I use Eternal now...I quit using Intersect about two years ago due to some problems with some PPascal software I was writing (not related to this problem, though). Any one else had problems?

5704. Magic Sac Plus forsale with ROMS

Newsgroup: comp.sys.atari.st
Date: 1988-09-24 20:04:47 UTC
From: deich@well.UUCP
Message-ID: <7194@well.UUCP>
Source record: 250504

Keywords: Magic Sac, SF354 drive, SMM804 printer
Magic Sac Plus for sale with 64k ROMS $100.00 make offer
SMM804 printer make offer $100.00
SF354 SS disk drive $90.00
These items are for sale by an acquaitance with no net acssess.
Please give a call to 505/869-3611 if interested.
Shipping is not include, but small items like this very inexpensive to ship.

5705. ST Appletalk, etc...

Newsgroup: comp.sys.atari.st
Date: 1988-09-24 22:44:00 UTC
From: cdj@psueclb.BITNET
Message-ID: <1256@PSUECLB>
Source record: 250505

Hi there...

About the AppleTalk on ST issue, I second the motion of the DMA interface. Trying to *write* data to the cartridge port is the kind of thing that sends developers screaming into the night. I am doing it with my senior EE development lab project, a Computer-Controlled Logic Analyzer. In order to control the thing, you use memory locations (READ ONLY) as 'switches'. If you had to write real data, you would probably have to read from a switch, then write to a dummy location in RAM, having the cartridge system take the next 16 bits on the data lines as ITS data as well. That means two memory accesses for each write, plus the data-line/valid data synchronization nightmare.

You know, I sure with I had the resources to replace the MMU chip with a similar one that *would* allow writes to the cartridge port. As it is now, what's a hacker to do? ;-)

5706. Re: Networking, ST's and Spectre 128

Newsgroup: comp.sys.atari.st
Date: 1988-09-25 02:19:45 UTC
From: Thomas_E_Zerucha@cup.portal.com
Message-ID: <9415@cup.portal.com>
Source record: 250506

I think the 128K roms take the 128K address space of the cartridge port,
so you can't add any networking there. The DMA port has possibilities.

But I think it would be interesting if someone came up with a Mega ST
expansion board which had sockets for the Macintosh chips (one place that
had the ROMs had the IWM, and the Zilog chip should be available). So
you could get a much more maclike machine. It might be able to fix the
zerostore bug in hardware too. And of course, if it had the Zilog chip
at the same address, Appletalk should then work. Just dreaming...
but I think it is possible, i.e. enough space in the Mega's memmap.

5708. Re: Writing to write protected disks?

Newsgroup: comp.sys.atari.st
Date: 1988-09-25 18:42:30 UTC
From: whitbye@cs.glasgow.ac.uk
Message-ID: <1661@crete.cs.glasgow.ac.uk>
Source record: 250508

At the moment I don't have a program that writes to the write protected
disks, but I wouldn't send such a program across the net anyway, as all
the hackers would get hold of it and write a virus with it.
Imagine having a virus that ignores write protection.

.....
>I believe it's necessary to save (some) registers around BIOS and XBIOS
>traps. The question for today is: which ones? Is there any rhyme or
>reason to which registers get trashed inside the trap?

D0-D2 and A0-A2, reason: they aren't saved by the trap handler, but
are used by the calls, why Atari decided not to save all regs they use
is a mystery to me (the calls are so slow just because they save nearly
everthing, it seems a shame they didn't do it all).

>A related question; am I correct in assuming that GEMDOS traps don't
>require register saving?

I wouldn't count on that, suposedly D0 and A0 get zapped (I don't have
the official Atari doc's lying around here, but I'll check on Monday).

(base note is Dave Beckemeyer's note about the Atari ST being a dying machine).

Dave, Neil Harris would probably agree with you. He just quit Atari. You can bet that if there were a future there, he'd have stayed.

Neil is headed for GEnie network management, I understand. I wish him luck.

I personally feel (and this is just my personal opinion) that this is a good event to mark as "the end of Atari US". Atari has lost far more than just one employee-slave.

Datafree in Toronto is selling a 2.5 / 4 meg expansion board that plugs in
to 520's and 1040's for about 150.00 canadian.
It is a 4 layer board, noise free and extremely reliable and easy to install.
I've had mine for over a year now with 4 megs in a 520 with no problems.
Call them at (416) 741-9825.
I'm not too sure about their ram pricing (but then who is these days)

5714. Awful new TOS - HELP!

Newsgroup: comp.sys.atari.st
Date: 1988-09-26 10:35:03 UTC
From: markhof@exunido.uucp
Message-ID: <636@laura.UUCP>
Source record: 250514

Hi there!

I got my ATARI 1040 ST in spring 1987 and still everything is fine with it. Now, Several days ago, my sister bought also an ATARI 1040 ST, but unfortunatly it differs from mine. Many programms that run perfectly on my old ST are not executeable on the new ST of my sister. Or, if they are executeable on the new ST of my sister, their behavior is not exactly the same as on my old ST.

First, I thought, the new ST of my sister would be defect. But then I detected that the new ST has a TOS-Version (19.0 from April 87) that differs from the one of my old ST (19.0 from Feb. 86). I guess the newer TOS Version must be the so called blitter-TOS. I heard that some programms for the 1040 ST do not run on the Mega ST, because of its new TOS. But I wonder why ATARI inserts the new TOS Version in the 1040 ST. There is no blitter for the 1040 ST!

Ok, I know that the new TOS is a debugged Version of the older Version. And some Funktions now work more pleasant. For example, if you copy a file from "Disk A" to "Disk B" by using only one Drive, you only have to exchange the disks ONCE. That's nice. But how is it possible to introduce a new TOS Version which is not compatible to the old one! Old software can't be used with the new TOS. But people buy a computer because they expect that can use known programms! For my opinion, a dealer how sells ATARI ST computer with the new TOS has to give a warning to the customer, that this computer has only a reduced useablity!

Now, my sister is disappointed because she got such a ST with reduced useability. I guess, other people have the same problems with the new TOS Version. I'm interested in any comments. Which programms are not executable with the new TOS Version? And why not? Is it possible to get newer Versions of these Programms which are executable with the new TOS? And what can I do to make it possible to run all Programm, that run on the old ST, to run on the new ST?

Thanks for every hint!

Ingolf Markhof.

5715. Re: Register saving for BIOS traps?

Newsgroup: comp.sys.atari.st
Date: 1988-09-26 11:05:19 UTC
From: t68@nikhefh.hep.nl
Message-ID: <540@nikhefh.hep.nl>
Source record: 250515

The BIOS and XBIOS use internally the registers d0-d2 and a0-a2
Gemdos uses d0 and a0 except for the call Super (gemdos $20) which
uses also d1 and a1. The last one is in hardly any book.

The reason of the BIOS and XBIOS register use lies (I believe) in the fact
that the DRI compiler considers d0-d2/a0-a2 as local registers.
It causes some problems with Turbo-C, because it has to save a2 specifically.
(Turbo-C can have 5 a register variables!)
The reason for d1 and a1 beying demolished in a Super call is found in
sloppy writing of the Gemdos traphandler.

5717. PRINTER Recommendations Requested

Newsgroup: comp.sys.atari.st
Date: 1988-09-26 16:02:11 UTC
From: jhs@druin.ATT.COM
Message-ID: <309@druin.ATT.COM>
Source record: 250517

{ Reposted -- I didn't see this on Friday, so I'm not sure if it got to the net; apologies for the revised posting if it did.}

I have decided to invest in my own printer (I have loaner from work that I'm not real happy with. My requirements for a printer to work with my 1040ST are fairly modest:

* Near letter quality (this *is* a must for me)

* Multiple character sets ("standard" character sets)

* Graphics capability (doesn't have to be sophisticated)

* Reasonable character speed in draft and NLQ modes (200/100 cps range respectively?)

* Reasonable price (under $300 is good, < $200 is better)

I had decided last year on a Panasonic 1091i(?), but since I didn't get it then, I would appreciate current recommendations/views based on experience (ideally). If a survey or summary has been done in the recent past, a copy of that would be great.

E-mail reply is best, but if there is general interest, perhaps a posting would be worthwhile. Thanx for the help.

5719. Re: Writing to write protected disks?

Newsgroup: comp.sys.atari.st
Date: 1988-09-26 17:37:01 UTC
From: artw@pnet01.cts.com
Message-ID: <3471@crash.cts.com>
Source record: 250526

With all this discussion about supposedly being able to write to write-protected disks, I just thought I'd get my $.02 in. According to what I've heard from various techs, there's a mechanical thingamabob in the drive that senses the presence of the write protect tab (you can see it if you look inside the drive). It's connected to a switch which shuts off the write current to the heads. So there's just no way for the drive to write to the disk. The system can be fooled into thinking it can but it still won't be able to do so.

>not work. This is what the documentation says to use. I really am to used
[stuff deleted]
>mike

You can patch the gulam keymap. Change the code for <bs> from 0x08 (^H) to
0x7f and for <del> from 0x7f to 0x04 (^D). Of course, this is only a hack,
not a solution, in the query-replace comand you have to use the <bs> key
instead of the <del> key.
To patch the keymap use either gulamfix, which has been posted in the
comp.src/bin/comp?.atari.st group some month ago, or a diskeditor.
If you use the diskeditor search for the string "1234567890", it should
then find the keytable.
Don't forget to patch all three tables.
I have done this yesterday, and it works (with gulamfix).

Good luck!

>BTW, I don't know how rich you folks are, but I think $5 an hour is not
>cheap. Do we base our standards on Compu$erve?

In the world of information services like GEnie and CI$, $5 is not the high end, so in relation, yes, it is "cheap", however, in relation to one's own finances, the difference between $5 and $12.50 an hour may be negligible. Some people can't pay even the $5, and some don't flinch at $7.50 an hour difference.

5731. Beckemeyer/Berkely hard disk interface?

Newsgroup: comp.sys.atari.st
Date: 1988-09-27 04:12:31 UTC
From: john@syssol.UUCP
Message-ID: <301@syssol.UUCP>
Source record: 250531

I am posting this for a friend who does not have net access.
He has a 520 and a hard disk with an st506 interface.

He would like to get the Beckemeyer (sp?) (Berkely Micro Systems ?)
board set for the ST as it is known to operate with the drive he has
(6 track, 640 cyl, write precomp on at track 0). He cannot seem to
find the address for the company anywhere (he is also living about
400 miles from anything remotely describable as civilization).

Could someone send me the address and/or phone of a source of the
board sets so I can pass it on to him?

Are there reasonable substitutes for the above if they have gone
out of business?

I'd appreciate an email reply as I don't usually read this group
although I will keep a lookout here just in case.

Thanks for any help......

5732. Signum, TeX

Newsgroup: comp.sys.atari.st
Date: 1988-09-27 04:42:11 UTC
From: mpsimon@phoenix.Princeton.EDU
Message-ID: <3774@phoenix.Princeton.EDU>
Source record: 250532

Below you will find a compilation of the replies I received concerning my inquiry about Signum and TeX a little while ago. Thanks alot to all who replied.

Summary of responses: Signum requires a mono monitor, sounds good, suggest you have a hard disk to use it. Printing quality is fine, printing on epson compatibles is slow. Output file is Signum's own. There are at least two implementations of TeX available in Europe, both pretty complete. Not much news on either Signum or TeX specifically concerning the US.

--Patrick Simon mpsimon@phoenix.princeton.edu
9-27-88

------------responses begin here--

From unido!cosmo!THANSEN@uunet.UU.NET Sat Sep 10 05:23:05 1988

Using Signum for bearly one year I can say that it is an immense help for writing my reports (I'm studying chemistry).

Now let me try to answer your questions:

- Using Signum you need a monochrome monitor
- It will work on a 1040 ST, it does not require a hard drive
- Printing on an Epson compatible is possible.
- Signum2 (this is the update from "Signum") is able to support graphics figures in the text. There is a program on the disc, which allows you to "photograph" the screen and put the graphic into the text. The picture format is copatible to the STAD painting program.

I hope my response was a little help for you. If you have more questions; write a message to me.

No, (in my experience) no color monitor is supported.
The european version of SIGNUM works fine on 1040s.
A hard drive is not required, but you should use one, because SIGNUM makes frequent use of disk (consists of a bunch of utilities).

>
> 2. What file format/printing options? I.e. does it produce DVI output files,
> can I print to an Epson compatible, or to a postscript printer?

Output to EPSON compatible printers (9 dots) is supported, but very slow (about 15 min per page, because each line is printed 6 times). 24 dot printers would be a good guess. There also is an ATARI Laser driver included.
The .SDO file format is only compatible with SIGNUM, but ASCII imports/exports are possible.

>
> 3. Will it support graphics figures in the text?

Yes, and in VERY GOOD QUALITY !!! And you can change the size of graphics images, you can easily duplicate them, without any problems of overlapping !
Also the texts !

>
> 4. Suggested retail price in the USA? (STPlus has it advertised for $250).

Could be true, I think. The german version is DM449, that is, about $230).

>
> 5. Any major or minor limitations encountered by current/previous users?

The print speed. The printing image is very good, but it must be printed 6 times each line for max quality.

--

SIGNUM is a WYSIWYG editor, I mean what I say. Great stuff. Very quick on editing. No fatal bugs detected in the german version (tested a friend's SIGNUM over 3 Months).

1988

We use Signum (Signum2 since 4 month) since 2 years.
It does not produce anything like a DVI-file.
You can use it with a 9- , 24-dot printer or a laserprinter.
Drivers for various printers are available.
TeX is available in two implementations for the Atari in Germany.
Both offer everything from PLAIN to LATEX and AMS-TeX and also
METAFONT. Both come with drivers for some 40 printers (dot, laser...).
Compiling speed is 1page/3sec . Printing speed 2pages/min to 1page/min
depending on resolution and number of fonts. Quality of software and
output is very good.

SIGNUM is develloped and distributed by
APPLICATION SYSTEMS HEIDELBERG
Postfach 102646
D-6900 Heidelberg

West Germany

TeX Is implemented and distributed by

TOOLS GmbH
Kessenicher Str. 108

Regarding the recent questions as to the level of ST sales in West Germany: I have no idea. However, I was in Munich last week [Oktoberfest time!] and was impressed by the visibility of the line. For one thing, you can't get on board a bus or subway without seeing an ad for the Mega ST. For another, you find the ST among the most prominently displayed machines in almost every department store. I realize that this doesn't mean they are selling, but it does have a psychological effect: the ST feels more alive over there. In constrast to the States [possibly excluding that big one out West], where the hardest part about buying an ST is to figure out who sells them.

Subj: dying computer sales

Maury Markowitz (maury@laucosc.bitnet) writes:

> Recently I talked to a local developer who had been to a recent trade show
> in West Germany and reported it to be quite a shock, as he stated that there
> were Ataris "everywhere", a comment that I here from the local Atari dealer
> ship often.

There's no doubt about it that the ST line is very succesful in Europe. Just take a look at the number of magazines and clubs dedicated to the ST. ST's are also widespread on technological universities and information science departments.

> My question is this: What is the REAL sales flow in West Germany and the rest
> of Europe?

I don't know the German figures, but the 1987 annual turnover of Atari in the Benelux (Belgium, The Netherlands and Luxemburg) was 37 million Dutch guilders (appr. 18 million dollar). This is an increase of 40 %.

Worldwide profit however went down from 29 million dollar to 11 million dollar. The 29 million dollar profit partly consisted of a tax profit of 11.6 million.

Worldwide turnover in 1987 was 493.1 million dollar. An increase of 91 %.
Of course this includes all the Atari products (XT's, PC's, etc.).

New marketing organizations were founded in Spain, Scandinavia and Australasia.

In the first 6 months of this year (1988) worldwide turnover was 334 million dollar (an increase of 250 % compared to 1987).

I think a lot of computer companies would like to die this way.

5738. Register saving for BIOS traps?

Newsgroup: comp.sys.atari.st
Date: 1988-09-27 13:33:00 UTC
From: jrd@STONY-BROOK.SCRC.SYMBOLICS.COM
Message-ID: <19880927133333.8.JRD@MOA.SCRC.Symbolics.COM>
Source record: 250538

I think I remember a discussion about this a while ago, but don't remember the outcome.

I believe it's necessary to save (some) registers around BIOS and XBIOS traps. The question for today is: which ones? Is there any rhyme or reason to which registers get trashed inside the trap?

A related question; am I correct in assuming that GEMDOS traps don't require register saving?

Thanks in advance for any info.

I personally do not believe whether anyone believes me or not, but the drives on the ST do not care what you do. All the drive does is send a signal to the OS telling you that you are trying to do something daft.
Rewrite the OS and you can do whatever you want.
I know that this is the way so please do not waste your time telling me that I am wrong.

In article <569@sdcc15.UUCP> pa1132@sdcc15.UUCP () writes:
>I am just interested in Laser C. In the newest issue of STart an
>article on C mentions that Laser C has some window management
>routines. Can anybody with experience on Laser C give more info on
>this? Any help is appreciated.

Laser C's window management routines are some Megamax-specific (non-GEM, non-Unix) functions that help in window manipulation, redraw, and whatnot. For instance, instead of calculating intersecting rectangles (as you must when you redraw a GEM scree that's been updated), Laser C comes with a "calculate-intersection-of-two-rectangles" route.

I'd give more specific details, but I haven't written a mega-big window-based application yet. B-)

--R.J.
B-)

P.S. Laser C i, in my opinion, _the_ best C package for the ST right now.

In article <4941@saturn.ucsc.edu> humtech@ucschu.ucsc.edu (Mark Frost) writes:
>It has been implied that to use the Spectre, you need to have Mac ROMs. Where
>in the world do you get these? I can't believe Apple is so generous as to sell
>them to anyone who wants them. Where do you get them, and how expensive are
>they?

You're right, Apple Computers is too bureaucratic to be generous to sell
their 128K ROMs. However, Apple Dealers, being raised on an attitude of
"Make a buck any way you can" (why else are they selling Apples? B-), will
gladly sell you whatever ROMs they have on hand. The 128K ROMs will cost
about $150~$200, I think.

(And if you can't find a dealer nearby, mail-order services will usually
advertise that they have the ROMs as well. I also think Dave Small can help
you get them, but I'm not sure)

--R.J.
B-)

P.S. In response to the other question, there probably won't be a Spectre 256
because (1) the 256K ROMs aren't _that_ much different from the 128K ROMs, and
(2) the 256K ROMs support Mac-color, which Dave small has said he can't (and
won't even try to) hack out.

Disclaimer: These are my views, and mine alone.

If you're talking about the differential at 1200 baud, then I think that GEnie is a definite price-performance winner; however, if you're running at 2400, then CI$ becomes the big win. There are far more 2400 baud CI$ nodes, they are still 12.50/hr, and you can get there at that rate 24 hr/day. GEnie, on the other hand has a paucity of 2400 baud nodes, they cost more per hour, and every one I have been able to find has a $10 or $12/hr "surcharge" added. As a matter of fact, when I lived in Glendale (4 miles from downtown LA), the only 1200 baud number that wasn't a toll call had a surcharge on it. This is all in addition to the limitation on the hours when the system is available.

Additionally, if your main activity is uploading and downloading, then CI$ is a lot less frustrating on throughput (so long as your comm program supports their QuickB protocol). I have never gotten less than 110 bytes/sec at 1200 on CI$ using QuickB and I've never gotten better than 75 bytes/sec on GEnie.

Just my personal opinions, but I think that the old saw "you get what you pay for" has some credibility here.

-------------------------------------------------------------------------]
```

Hello,

we have mega-problems using the cartridge port on our MEGA ST2 and we think it is a common problem for all MEGA's with a boardrevision higher than revision 4. We use the cartridge/ROM-port to read data from an ADC to digitize satellite WEFAX-pictures from METEOSAT. The soft- and hardware works fine on a MEGA ST2 with a revision-4 board or a 1040STf, but it crashes (with 4 bombs) on any MEGA ST2 with a revision-5 board.

Our dealer (ECD delft) and ATARI Benelux (Netherlands) couldn't help us (yet?), so we would like to ask if there is somebody on this net with enough inside knowledge to help us. We would like to find out if there is a software or hardware difference between the mentioned boardrevisions, and if so what these differences are.

5748. Odd 6.0 bug

Newsgroup: comp.sys.atari.st
Date: 1988-09-27 17:31:06 UTC
From: imp@crayview.msi.umn.edu
Message-ID: <7965@umn-cs.CS.UMN.EDU>
Source record: 250548
Cross-posted to: comp.sys.mac,comp.sys.atari.st

I just came across yet another bug in System Software 6.0 that I haven't seen mentioned elsewhere:

I toasted one of my hard disks and wanted to reinitialize it with HD SC Setup (this was on a Mac II). Well, HDSCS won't let you init a mounted volume, right? So I dragged it to the trash and proceeded to initialize it with HDSCS. I quit back to the unifinder and was presented with two (!!) icons for that disk: a normal SCSI disk icon and a FLOPPY disk icon. Both icons had the same space available, etc, and copying to one put the object on both.

I duplicated this error with a debugger loaded and took a look at the drive queue and VCB lists. The dual entries were identical (important stuff like driver and volume reference numbers too).

5751. Horrible, Horrible bug in TOS

Newsgroup: comp.sys.atari.st
Date: 1988-09-28 05:22:24 UTC
From: UD040164@NDSUVM1.BITNET
Message-ID: <1385UD040164@NDSUVM1>
Source record: 250451

I have found a very serious bug in TOS, which can be duplicated, if you dare perform it on your computer.

In the desktop, click once on the Trash Can icon. Select "Get Info" from the File menu. Read the window, notice the reference to permanently deleting _disks_ if you drag them to the trash.

Click on a disk icon and drag it to the trash. Read the offensive message telling you that you can't do that.

Laugh at the inconsistancy.

I would recommend that no one buy Atari computers until this terrible bug is repaired.

Heh-Heh-Heh.

I just got really sick of people whining about bugs in unreleased products :-)

Is there a way to capture postscript output from Timeworks Desktop Publisher into a file? I don't have a lazer printer, but have access to one on campus, and would like to be able to u/l the captured files to our VAX for printing on the lazer.

This probably means re-installing it for a postscript lazer printer (mine is installed for the Epson LX) and then somehow capturing or re-routing the data that would go into the printer port upon printing.

Is this possible? If so, how?

> in the world do you get these? I can't believe Apple is so generous as to sell
> them to anyone who wants them. Where do you get them, and how expensive are
> they?

The Spectre 128 requires you to have either the Mac(tm) 64K or
128K ROMs. The 128K ROMs are available from Apple dealers so that you
can upgrade a 64K ROM Mac to the 128K ROMs. (Note: not all dealers
carry the ROM upgrades.) They normally sell for about $90 to $100.

You also might check ads in Computer Shopper. Several companies
sell the 128K ROMs for upgrades.

If anyone out there has a copy of NetHack for the ST then you couldn't possibly send me a copy or possibly give me some form of address , and I could send out some disks.
By the way who cares if you can write to write-protected disks anyway.
When a program appears to do it and we get hold of it then everyone will believe.

>every one I have been able to find has a $10 or $12/hr "surcharge" added.

On another service, this argument was said on the service I belong to...

In response to BYTE being MS-DOS, I usually ask the accusser when
he or she last read BYTE. In your case, I would have pointed out that
the August issue had a 96-page special supplement for Mac users. I also
would have pointed out the article on UNIX for the Mac, products for
the Mac galore, reviews of numerous non-MS-DOS products, and three articles
on C.
As for BIX being too expensive during prime time, I mention that Genie
is $34 an hour. As CIS being cheaper, I point out that 1200-baud access
over CIS lines at non peak is $12.50. BIX is $12. At 2400, the other guys
are more expensive as well (BIX is $13.50).
If folks have PC Pursuit, they can call our Boston number.
If folks used BIX when it first went on line, their account is still
avail-
able. They should try the commands now.
I can't imagine anyone truly believing that Genie or CIS is more
spunky. It just aint so.
File transfers are a booger wherever you go on a packet network. BIX
was miserable at first. Now, I think we are as good as anybody.
This is in no way a criticism of you, Jim. I have had these sort of
discussions at shows before. Usually, the complainer is speaking through
his hat. I try not to argue, but I do shot holes, gently, in their
statements.
It's nice to hear that we have some good points. Most of the complaints
you cite *were* true. When we started up, frankly, we had no idea of
what we were doing. At least I didn't. I shouldn't speak for everyone
else. We haven't done any marketing to counteract the rumors and mis-
information out there. This soon will change.

[End of captured text..] Just thought another viewpoint would be
interesting. Me, I'm waiting until I can think of a free way into C$.

Be aware that my manual for the Xebec X1410 states that you can only have one model of disk drive on it. That is to say, unit 0 and unit 1 must be identical drive types (I think this is because the drive geometry info is only stored *once*). Check your documentation.
- HBM

The above is my own personal opinion. If Digital wants it, they can pay for it.

5761. Animation Revisited

Newsgroup: comp.sys.atari.st

>--
> Peter da Silva `-_-' peter@sugar.uu.net

Actually, this doesn't work so well. The animation will only be
flicker-free when Vsync() comes _after_ the Setscreen call. It's not
obvious why this is, but I've done several tests that show it to
be the case (I recompiled exisiting programs, only changing the placement
of Vsync).
Also, I don't understand the argument that you'll get less idle time
by moving the Vsync(). I was thinking of the page flipping occuring in
a loop; for exmaple:

for (;;) {
/*
* Do stuff
*/

Setscreen(...);
Vsync();

/*
* Do stuff
*/
}

Moving the Vsync shouldn't change how much idle time you get. In the
sections commented "do stuff", you have about 1/60th of a second worth
of processing time. How much time is spent idle depends on how close
you get to filling these sections (if you put too much code in these
sections, you will only hit every other vblank).
```

5762. Re: PRINTER Recommendations

Newsgroup: comp.sys.atari.st
Date: 1988-09-28 23:05:55 UTC
From: BobR@cup.portal.com
Message-ID: <9539@cup.portal.com>
Source record: 250462

Responding to Jeff Shore's request for printer recommendatons...

The Panasonic 1092i fills all the specifications of the request quite nicely.

It prints at 240 CPS in Draft, 48 CPS in NLQ (a very nice NLQ)
Has downloadable fonts (different from printing with Publishing Partner)
Full graphics capability (which means it'll work with Pub. Partner)
Costs less than $300

The only caveat is thatThe only caveat is that my experience with the Panasoni cartridges has been less than thrilling. None have lasted as long as I'm used to seeing from an Epson MX-80 cartridge, and the price is higher. Also, some of the less expensive cartridges have had a tendency to tear and tangle. I'm still looking for a good, low cost supply of ribbons.

On the other hand, others with Panasonic printers have had no problems...

5763. Yet More on Animation

Newsgroup: comp.sys.atari.st
Date: 1988-09-28 23:23:32 UTC
From: dmb@TIS.COM
Message-ID: <8809282323.AA10646@TIS.COM>
Source record: 250463

There was some discussion about Setscreen waiting for the vertical
blank before returning. I tried a few things to see how Setscreen
behaves in practice, and I still believe that

Setscreen returns immediately.

If Setscreen waited for the vertical blank when you set the
physical screen base, the following code would take about 1 minute:

```
for (i = 0; i < 3600; i++) {
Setscreen((char *) -1L, Physbase(), -1);
}
```

It doesn't. It takes about 2 seconds. This means that Setscreen does
not wait for the vertical blank to return.
It _is_ true that the physical screen base doesn't actually set until
the vertical blank. This is because Setscreen simply writes a value into
a location in page 4. The _vertical blank routine_ looks at this location
and sets the physical base. We're talking about an interrupt here.
So you do have to Vsync after setting the physcial screen to be sure
you won't get flicker. To illustrate:

C statement executed Status of VBI

```
for (;;) {
/*
* Do stuff Yet to come
*/

Setscreen(...) Yet to come
Vsync(); It happens

/*
* Do stuff Just finished (now
*/ previous Setscreen
has taken effect)
}
```

If you don't explicitly Vsync, some of your Setscreen calls won't
ever take effect (they will be "overwriten" by the next Setscreen
call).
Unless my compiler is different from everyone else's (I'm usnig
Laser C), this is how Setscreen works.

How rumors start

There's still hope for the machine. TOS 1.4 really makes a difference (and will make more on ROM). You might say that it gives you the machine you thought you were buying in the first place. If Atari had released these fixes two years ago, I suspect traffic in this group would have been reduced by half!

Anyway, I heard that Atari was dying from an independent source. A student here who has been interested in the ST's for some time decided it was time to by one, so he started calling the various advertisers listed in ST magazines. He came to me, dismayed. "All the places I called have stopped carrying Atari computers. One place told me that Atari wasn't selling computers anymore. Did they go out of business?"

I explained that Atari, in their infinite(smal) wisdom was only selling 520STs via mail order these days. I asked if he'd checked with our local Atari dealer. "Yes, but their price is so high that if I have to go that route, I'll just get a Mac through the University discount program instead." In the end, he bought a used ST from another student who had also become convinced that Atari was dying or dead after talking to mail order distributors.

Has Atari given any thought to trying to soothe their mail order distributors? Those guys have the potential for spreading the doom and gloom over a vast geographical area...and it sounds like some of them intend to do just that.

On the upside, word is that the university discount prices of macs are about to take a jump upwards, which will make STs look better. On the downside, IBM, Toshiba, and Zenith are now offering discounts here, and they have some good deals.

I hope Atari doesn't turn this rumor into reality. I still like the ST, despite some of the company it keeps...

[claims the ST cannot connect to Appletalk through the cartridge port
since it has no capablity to interrupt the CPU...]

I am not trying to defend the *stupid* design of the cartridge port in
the ST (when it could easily have been a full expansion slot), BUT:

A device there that would connect the ST to Appletalk (or any other
network of similar speed) could have some reasonable amount of RAM so
that it could buffer incoming (and outgoing) data. The CPU could
poll it every once in a while, often enough to prevent overflow
of the buffer, and do a quick transfer of the data into the CPU's
RAM if there is anything in the buffer. Outgoing data could be
deposited in the buffer and then sent at the network speed by the
controller on the cartridge. Sort of like pseudo DMA :-)
Of course this method means more hardware on the cartridge, meaning
higher cost. But not THAT much. The pure-software solution used
in the Mac (typical of Apple) has its own disadvantages too, as
the previous poster indicated.

A solution using the DMA port is of course more elegant.

What's new in the field of ST networking through the MIDI ports?

i haven't been writing any networking code, but i have been looking into MIDI networking. you could use a true ring topology, with packets being received and retransmitted around the ring. this would require interrupt driven receiving and sending through the MIDI port. at the moment, the MIDI ACIA chip is configured to do interrupt-driven receiving, and busy-waits for sends. this is sub-optimal.

the 6850, however, can be set to another mode which interrupts on both receipt and sending. the midi and keyboard acias share an interrupt; therefore, you would have to replace the current handler with a new one which checked for more conditions. this would eat a little more CPU than the present routine.

anyone want to write a TCP/IP sort of network? you could do print sharing using a memory buffer, and disk sharing by using a GEMDOS-level driver.

if you wanted to get really fancy, you could also allow the rs232 as a device, to link rings, or over Bitnet or a conferencing system such as Genie. and maybe you can rig the parallel port to send and receive... or... or...

I don't know why we're discussing bugs in Berkeley Telnet on this newsgroup, but the fact that ^C doesn't stop output in telnet is not peculiar to the Sun implementation. Since the same problem is likely to occur with micro implementations, and people are beginning to use PC's of various kinds as virtual terminals over the network, it is probably worth noting at least briefly what is going on. When you open a virtual terminal connection using telnet (the official virtual terminal protocol for TCP/IP), there are typically delays in getting control characters to take effect. The most obvious delays are when you try to pause output using ^S, or stop it completely using ^O, ^C or whatever your OS uses. Most TCP implementations do lots of buffering of data, in order to improve throughput and decrease overhead. When you do something like ^C, the host may immediately stop generating output, but there may be several pages of data already in flight in various pieces of the networking software. In order to stop output more quickly, telnet has something called "sync," which allows the host to clear all that buffered output. It isn't perfect, but with good software on both ends, the runover can be kept down to a few lines. The problem is that a lot of TCP/IP implementations are based on Berkeley code, and Berkeley didn't implement sync in 4.2 BSD. (Most Unix vendors' TCP/IP code until very recently was based on 4.2.) In order for sync to work, both ends must implement it. 4.3 BSD implements it on the server end but not the user end. I think 4.3 Tahoe may have added user end support as well. (Just server end means that if you use a 4.3 system as a host, and your PC or terminal server does sync, things will work. But if you telnet out of the 4.3 system, things won't work, since it isn't in the user telnet.) Depending upon which VMS implementation you used and how old the software is, there's a good chance that your VMS host didn't do sync. There is another program for doing virtual terminal connections, called rlogin. It transfers a bit more information about the status of the terminal. So it allows stopping and starting to work somewhat more quickly. Although this was initially invented by Berkeley for Unix, many other implementations now support rlogin (including both PC and VMS implementations). So if you want output to stop quickly, you might try rlogin. However if you are buying TCP/IP software, I also suggest checking to see whether it implements telnet sync, since telnet is still more widely available than rlogin.

[May I suggest that this is not an appropriate set of newsgroups in which to air everything you've ever tried to do on a Sun and not had work correctly.]

5772. Items for sale!

Newsgroup: comp.sys.atari.st
Date: 1988-09-29 14:54:40 UTC
From: 870646c@aucs.UUCP
Message-ID: <1282@aucs.UUCP>
Source record: 250472

Hi all, I tried to post a message last night, but I am not sure that it got through. Well here it goes again:

I have the following items for sale, prices are in Canadian dollars. Remember that things cost more in Canada, so please do not reply telling me that you can get a certain item for X amount of dollars in the US. All the items listed are in MINT CONDITION and include all orginal packing. All items have been used by me here at school in a non-business manner.

1-SLM804 Laser Printer, < 300 pages have been printed on it, still under warr. Sells for $3000.00 CDN asking $2050.00 CDN.

1-SH204 Hard Disk, 20meg ST225 on board. Sells for $1100.00 CDN asking $750.00 CDN.

1-SM125 Monochrome Monitor, Sells for $300.00 CDN, asking $200.00 CDN.

1-SC1224 Colour Monitor, JVC model(best one made), sells for $650.00 CDN, asking $400.00 CDN.

I will be posting a list of software in the next day or so. Included on the list will be Laser C Ver. 1.1, the COMPLETE Cyber Studio line of software, OSS Personal Pascal, Assempro, MT-C Shell, several games, Degas Elite, etc. If you are interested in any of the above items you can reply to this msg. or call me at 1-(902)-542-9909(this is a pay phone outside of my room here at school), the best times to call are between 7:00pm-11:00 Atlantic time. Once again I must state that all items are as mint as they can be, and that all items have been looked after with the up-most care.

Thanks for your time.
Barry Comer

>... is it absolutely necessary to have
>a monochome monitor?

You don't need a monochrome monitor for the Spectre 128, but it looks nicer.
If you're using a color monitor, then grey shades are used for the screen, and
the locations of the pixels are mapped to different shades (since the Mac
monitor has more pixels vertically than the ST's medium resolution has). You
can also hit a key and get a fully-mapped view of the top/bottom half of the
screen.

--R.J.
B-)

P.S. This is the same trick the Magic Sac uses for its color monitor support.

Subject: Another TurboDos problem
Message-Id: <438@gould.doc.ic.ac.uk>
References: <19880907153917.7.JRD@MOA.SCRC.Symbolics.COM>
Sender: info-atari16-request@score.stanford.edu
To: info-atari16@score.stanford.edu

Recently, there have have been several messages describing some
more problems with TurboDos... I would like to describe another problem:

A friend of mine [without net access] recently bought Metacomco Pascal-2.
This uses the same [GST] linker as does Metacomco Lattice C 3.04.01,
a product which I have bought.

Well, when any Pascal program [even one as simple as "hello world"] is compiled
on an SH204 with TurboDos running, the linker reckons that the .bin file
produced by the compiler is not a valid linker format file..

After much experimentation, we found that rebooting without TurboDos
and recompiling fixed the problem...
this is irritating, however, to say the least... does anyone know why
this should happen?
All I could think of was that Pascal-2 doesn't close the .bin file down
properly??
[Whereas Lattice C does, presumably?]

Can anyone explain what's happening here?

I will happily summarise any replies I get...

Thanks..
Duncan

Yes it is unfortunately possible to write to write protected disks.
This is a great idea for software protection, which I personally don't
believe in, but you do get the unscrupulous people who are that bad that
they will ruin everybody else's fun by writing pointless viusses which are
no use to absolutely anyonee

Subject: A Hard disk problem
Message-Id: <439@gould.doc.ic.ac.uk>
Sender: info-atari16-request@score.stanford.edu
To: info-atari16@score.stanford.edu

Hi there everyone,

I have a problem with my hard disk: at the recent Personal Computer [World]
Show in London, I bought the Hisoft FTL Modula-2 compiler for the ST.
[Show price, 90 quid including source level debugger and profiler and make
and resource editor]

I was happily installing this onto my SH204 hard disk, using the Desktop
to copy disk 3 of 4 when the blasted ST collapsed in a heap..
Vertical lines appeared on the screen, and I had to power off..

Sadly, the result is that the \M2\FTL directory I was installing into
is totally corrupted: if I open it with the Desktop the ST crashes again,
complete with vertical lines.
If, instead, I use Gulam and cd into the FTL subdirectory, the machine doesn't
crash, but ls reveals total garbage..

The rest of the disk is fine however.

So, what I want to do is remove the garbaged directory and start again.
What I thought might be possible is the following:

Recursively follow the directory structure, [except \M2\FTL of course]
and follow each cluster used by each file:

Mark in an array which clusters/sectors are used.

Then, when I have finished the traversal, blank the FAT entry for
every cluster/sector which the array marks as unused.

Now the crunch: I don't know enough about the FAT format to do this.
The only information I have is from an MS-DOS book "Tricks of the MS-DOS
Masters" which helpfully says "the format of the FAT is beyond the scope
of this book"... it recommends the "MS-DOS Developer's Guide" which I do not
have.

So, I wonder, would anyone care to tell me the format of the FAT table,
and any other information I might need [partition table, boot sector??]

or better yet, does anyone have source doing something similar to what
I want to do ???

[C preferred, Pascal, Modula-2 and 68k assembler acceptable, 8086 assembler
deplored but ok, if it's all you've got..]

If you care to mail me, I'll gladly post a summary of anything I get..
[post only if you can't find a path to me]

Thanks in advance, everyone...

Duncan.

> some config programs and drivers for the printer,but none to change the
> char set. Any help? Thanks in advance.

A while ago I posted a NLQPS (Near Letter Quality & Proportional
Spacing) program to one of the comp.{binaries,sources}.atari.st
newsgroups. It works very well (if I may say so myself 8-) with my old
Star Gemini 10X printer, which doesn't have an NLQ mode. It does a
double scan of each text line in graphics mode with a very tiny
linefeed inbetween (1/144 inch). The PS option can be turned off (e.g.
for listings, tables).

An older version had the capability to load the characterset used
dynamically from a file. I removed that option, thinking that there
would be no interest. If you (and perhaps some other people too) would
like that, I can add back that option. In that case there has to be
added a font editor too so you can easily define a new NLQ font. Ah,
perhaps a two phase project...

Leo.

P.S. To be able to use the NLQPS program, you must have a printer that
can do double density graphics, and linefeeds of half a dot distance
(1/144 inch), but I think today most printers can do that.

Yes a variety of comparsions are made to CIS and their $12.50 plus surcharges
in some cases for 1200 baud connections. This does make $5.00 much cheaper.
And Genie provides many of the same services, and some CIS doesn't and of
course vice/versa.

As far as GEnie mail and the BB software, there is room for improvement,
but CIS could use some to, either method has its drawbacks if looked at
very closely. The thing about Genie is you need to take the time to learn

how to use the software effectively, there are a lot of options and it
can be quite powerful if you learn to use them to your advantage...this
means reading the manual, and getting out there and just spend some time
seeing what the commands do, and ask questions if something does not
work like you expected....most of the problems it appears is that users
of Genie that have a hard time using it come from not reading the manual,
or not taking that couple minutes to ask the questions to learn how to use it.

Try the amateur radio magazine "QST" about two or three years ago. They had an article
or two on demodulating and decoding some satellites for display on
computers, I can't remember if it was Atari 8 bit or PCs... maybe both. If you
really meant 'weather radar' I don't know where to get info (like the
weather radar that the Weather Channel displays) but if you want visible light
or IR photographs I believe there is still stuff going on at 130-140 MHz
and certainly around 1.6 GHz where the GOES satellites transmit.
There is also WEFAX hardware available, again in amateur radio circles,
which will dump directly to a printer from data presently transmitted by
wire services and others. Try

Advanced Electronic Applications
P. O. Box C-2160
Lynnwood, WA 98036
(206) 775-7373
```

I built a system for copying ESSA and NIMBUS sattellites in the early 70's
but I don't think they are running anymore, though the same modulation
techniques are probably in use (NBFM with 2400 HZ subcarrier modulated
to provide synch and luminance info, 200? lines/min 800? lines/frame.)

All this talk about a dying computer is clearly by people who are either
1: unfamiliar with the European scene
2: unfriendly to the ST (have an axe to grind).

In Europe the ST is selling very well. Maybe a part of the American
problem (if it exists) is that a much larger percentage of systems sold
in the US is a color system than in Europe. The color systems are not really
very suitable to work with (in the eyes of all the people that I know who
have an Atari). This leaves the color systems as either a special purpose
system, or a games machine. If the dying approach concerns those applications
I'll not say very much. The monochrome systems that I see in use every day
are very powerful mini computers. In the shops they sell very well.

Maybe the good software never made it to the US. A sign that indicates this
is that even turbo-c for the ST was developed in Germany, not by Borland-US.

This leaves the question: why is the American preference for color so much
greater than in Europe? I posed this question a long time ago, but nobody
could come up with an explanation. Anybody has one?

Yes and no. It's not strange that a company is porting it's (good) product
over to another machine. What is strange is that they didn't do this sooner.
They would have their foot in the door, as the Amiga has good draw programs,
but few solid DTP programs (esp. at PP's price).

Correct, it appears that all the GCC related ARC files were compressed
using Squashing instead of Crunching.

>a newer version of arc from LISTSERV at CANADA01 (BITNET, as I am

There has been one major new version for the ST since 5.12 - 5.21,
with modifications to support Squashing. (developed by lil' ol' me.... }-)

If the person in charge of the CANAD01 LISTSERV would send me a message,
I'll ship 'em off a copy of the latest ARC. I can also be reached directly
on bitnet as

Humble apoligies if this has already been covered for I
do not normally access this fine newsgroup.
Does anyone know of a Public Domain program that will allow
users of an Atari ST to access a USENET site and receive mail,
send mail and NETNEWS? The program should be simple enough for
most to install, and be able to run uucico.
A ideas? I am sure with this wealth of knowledge here on the
net, someone may be able to help. It seems a shame that the
atari BBS are going to IBM's so that they can participate in mail

and a news feed.
Please respond via E-Mail. I do not get normal access to this
group.
This site has sent in their uucp map entry, but it has not yet
been posted to the net. So use the following return mail path:

...pacbell!sactoh0!ejnihill

In advance, Thank-you for your time & help;
Eric

Organization: University of California, Berkeley
Subject: moria troubles /// pascal info sought
Message-Id: <5864@pasteur.Berkeley.EDU>
Sender: info-atari16-request@score.stanford.edu
To: info-atari16@score.stanford.edu

This is a two parter:

I thought i had moria done all right, but no -- it won't run. It loads up,
then instantly dies with two bombs, then back to the desktop. It de-arced
ok here (where i got moria), but did not work. It de-arced fine at home

(on the ST), but did not work. Both times, I ran it from the desktop as .TOS and .TTP (which can't work as .TTP uppercases all text).

So I figure, I'll write a prog to call moria (and maybe add options features later), but that did not work. Back to the docs. Seems I have to set env vars. Well, I was pretty sure that was not the problem, but I whipped out 68000 ST Ref (by Peel), and looked up the AES calls. Why? Because I have Personal Pascal, which does not have a built in AES library. Then set up the AES calls (C-strings etc.) complied and ran the prog. Again, this did not work.

What is going on. Should I go back over my prog caller and make sure the command tail is ok? Should this work under the desktop? In any case, moria does not work for me :-{

Which brings me to my second:AND MORE IMPORTANT QUESTION

I use OSS personal pascal. i have no C compiler.
1) has anyone used Tackle box ST? Is it any good.
2) where can I find info on how to make flawless calls to OS routines from PP. Right now, I'm winging it, mimicking the examples from OSS and using the Peel book (which is very good).
3) should I just get C? Is the level of programming I want to do easier in C?
3a) Does MWC come with the Atari Devpack? (In other words, should i get just MWC, or pay the extra $100+ for developer support?)
4) what is a good assembler? Are there any object-file converters in case the objects are not compatible?
5) in general, what are some of the best tools out there (just kidding, don't answer this one).

#Yes it is unfortunately possible to write to write protected disks.
#This is a great idea for software protection, which I personally don't
#believe in, but you do get the unscrupulous people who are that bad that
#they will ruin everybody else's fun by writing pointless viusses which are
#no use to absolutely anyonee
#
#ps Borf is here.

C'mon... be more specific. Show me a program that writes to a writeprotected
disk. We did extensive tests on programs that claimed such activity and
always came to the conclusion that all of these rumours are bogwosh.

The hardware specs of Atari drives/diskcontroller are pretty much standard
and I've never (I mean NEVER) seen a modern diskdrive that wasn't
completely capable of recognizing writeprotection.

Gimme more than "Yes it is possible.."

FOR SALE: A slightly used Atari hard disk and cable (I have not had
an ST for quite a while) ..

It has software loaded on it.

Also I have a large horde of software I would like to sell

A partial list follows...

The following is a list of miscellaneous atari software/hardware
I currently possess.

Beckemeyer MT C-Shell
MICRO C-SHELL
MICRO RTX
MICRO MAKE
MICRO C-TOOLS
MegaMax C-compiler
Utilities
Atari Developer's system
linker
compiler
rcs
utilities
BASIC

Atari 20 MB ST hardware disk

I will try to put together
some very reasonable prices
upon request.

I have used tackle box a little and it seems ok. The documentation seems
somewhat better than that in the Abacus books or the developer kit, but
I have not check things carefully.

Note: I hoped to send this to David Small, but couldn't e-mail to him..

I don't know if it is even possible, but since you are making a new cartridge
for the 128k ROMs, will you also be putting in AppleTalk network port in?
Perhaps by putting in the Zilog chip onto the cart itself (since the chip can
be bought by anyone) you would be able to get networking into the Atari series
via AppleTalk. Perhaps making the Zilog chip available to the ST via. cart
slot and bypassing the Mac ROMs you could also introduce high speed nets to the
ST w/o using the Mac part of the cartridge? .. This way you could put a high
speed port on the Spectre 128 cart itself and wouldnt have to use the Atari's
hardware ports (as they are supposed to be slow compared to the AppleTalk
ports) for networking.

One of the big reasons I'm asking this is because I'm at Carnegie Mellon and we
have a computer net. called Andrew (as in Andrew Carnegie, MIT had a similar
system called Athena I think) which is a campus wide (even in the dorm rooms)
```

file server system. Just last year, they released a handler for the Macintosh that allows you to access the network via the AppleTalk port. (This project is a joint effort between CMU and IBM and recently Apple (using Mac II's as workstations soon)) Now the project is going to start at the University of Michigan (I think) as well and will be trying to get all kinds of computers (not just IBMs and Macs) onto the fileserver. The Andrew project is aimed towards Universities it seems.

If you could get the Spectre 128 to work with AppleTalk, then you would offer a "cheap" alternative to buying a $2000+ Mac SE and would get the business of students buying STs at colleges with the Andrew System..if the Andrew system goes over well. In addition, you could get the ST to share printers w/ Macs if necessary, send info between the two and so on.. a great aid to the ST line which has no really good networking to speak of. Having AppleTalk networking capabilities certainly won't hurt the product. eh?

Besides, it would be nice to use the laser printers in the clusters from my room.. sigh..

Re: Turbo Power without getting Burned!

***** PRESS RELEASE *****

There have been many mentions in the almost decade since the original Atari 400/800 Personal Computers hit the dealers shelves about there being a future upgrade to meet the user's needs, and new and more challenging applications. Finally that upgrade is available.....
The Turbo-816 by DataQue, for the Atari 400/800/XL/XE.

DataQue Software is pleased to announce a powerful new upgrade which was co-designed by Ron Shue, and Chuck Steinman. This upgrade will be available in two forms. There will be a replacement CPU board for the original 400/800 Computer system, and a plug in module for the XL/XE series. In either case, there usually is no need for any modifications to the existing hardware. The only exception to this is with XL/XE systems which have their CPU soldered in place, which will require the removal of the existing CPU, and the addition of a standard 40 pin I.C. socket is suggested. Also included is the Turbo-OS, by DataQue for use with the Turbo-816 CPU boards.

The Turbo-816 will not only increase the potential speed of the computer, but also break the 64k memory barrier of the existing systems. Not with the awkward paged memory, but with a fully linear decoded address space of up to 16 megabytes. Benchmarks have put the Turbo-816 into a performance range ABOVE many of the 'other" PCs/!! Special memory boards will be available to take advantage of the new extended addressing range. These will be mounted internal to the computer cabinet, and in most cases require no hardware modifications.

And here is the amazing feature..... While adding all this power and all this expanded addressing, the Turbo-816 for the Atari 8-bit computer systems will maintain compatibility with most currently available commercial and user written software. Using the Turbo-816 even those older programs will enjoy a speed increase!

The Turbo-OS is a replacement operating system for use with the Turbo-CPU which will release the 16-bit processor to its full power. Increased speed will be the most obvious change, but hidden in its code, will be an advanced new floating point library that will speed even the original Atari BASIC to new levels of performance. Again, on most systems it will be just a matter of replacing the existing ROM(s) with the Turbo-OS.

The future holds many more products for the Turbo-816 systems including:

1) a real-time multi-tasking operating system kernal
2) a new assembler-editor-debugger package which supports
the new assembly level instructions and addressing modes
3) a new BASIC which will speed past the fastest of the
current BASICs for the 8-bit machines
4) a new K&R compatible C development package
5) a new Turbo-GOS operating system (graphical based)
6) a developers development kit for new applications

The NEW Atari Turbo-816 should be available by November of 1988
For more information contact your local Atari Dealer or, write:

I've played this version of moria for probably about a hundred hours without
a real keyboard lockup. There was a problem when I did a ".<direction>"
move while confused, but it cleared itself in a few seconds. The program is
so large that I wonder if there might be too much already in your machine's
memory when you load it. I generally have a hard disk interface and a clock
setter in the auto folder, foldr100, FATSPEED, and the control panel. ST
curses is a stack hog, but the program was compiled with LOTS of stack space
to allow for that.
The case problem was a really dumb oversight. It should only interfere
with the use of the rogue key layout and consulting the highscores file,
though. TOS ignores upper and lower case in filenames. If this bothers
people enough, maybe someone (maybe me?) could come up with a binary patch.
In my experience, there's rarely a sequence of 20 op-codes that can't be
shortened enough to squeeze in 2 more.

I'd like to get users' reactions to Supra's 10 megabyte removable
cartridge "floppy". The ad says it can also read and write IBM 360k
and 1.2 meg diskettes. Have you tried it? Does it work well? Have you
tried it as a 5.25 inch drive with PC Ditto?

Thanks

In my opinion the 1200XL was one of the best 8 bit machines that atari produced.
It is more compatable to the 800/400 OS than the 800XL and the 130XE. It
seems that the 1200 got a bad rap when it was introduced.

Message-Id: <1971@brahma.cs.hw.ac.uk>
Sender: info-atari16-request@score.stanford.edu
To: info-atari16@score.stanford.edu

I was poking around in Neochrome the other day (is that illegal?) and found
some more negative Line A offsets.

Screen width -$2B4 # Note: The mouse pointer is clipped by these

Screen height -$2B2

Colours -$29A

Mouse X -$258 # These change even when mouse cursor is disabled

Mouse Y -$25A

Since they are in Neochrome and work with both ROM 1.00 and 1.02 then I assume they are officially supported. Thanks to his involvement with the BIOS Dave Staugas seems to be in a rather privileged position to know all this sort of stuff. Would Atari care to comment on these locations?

Now a different topic. I have a Xebec S1410A SASI controller board connected to a Hitachi DK511 40MB disk drive. When I do a system reset the heads take quite a time (and small steps) to get back to the boot partition C. If I have accessed partion E or F the ST times out and I have to press reset again. There is no problem going from F to C during normal usage only at reset and I know from experimentation that the problem does not involve the ST hardware or host card. Is this just a quirk of the Xebec that I have to live with or does someone know of a solution?

in article <8809191251.AA15678@ucbvax.Berkeley.EDU>, nfrech@ALMSA-1.ARPA ("Norman R.
Frech") says:
> I just got Dave Small's newsletter and I am fairly excited about this
> product. I don't know how to get to Dave on Usenet so I though maybe
> you could answer a few questions. He talks about a version 2.0
> coming up in the near future; will this be a free upgrade from 1.0 or
> will there be a charge? Second, is it absolutely necessary to have
> a monochome monitor?

You can reach Dave on the Well, try hplabs!well!dsmall, that
usually works for me.

I don't know if the upgrade to version 2.0 will be free or not.
In general upgrades to fix bugs in the code are free, upgrades that add
new features are a small fee ($10 to $20). The feature and bug fix list
for version 2.0 isn't finished yet so Dave hasn't decided what to do.
```

The Spectre 128 works with either the monochrome or color
monitors. A monochrome monitor is recommended since it is a *LOT* nicer
looking and easier to use. Color monitors work but they aren't
nearly as nice, the screen is smaller (640x200 instead of 640x400) and
updates to the screen are slower since the Spectre must convert the
"real" screen into the correct format for the ST color screen. If you
really want to use Mac(tm) software I'd recommend getting a monochrome
monitor.

Interfacing to Appletalk thru the cart port and Spectre 128 is a good idea,
but doing it through the DMA port would be the ideal method. There could
be an Appletalk connection whether Spectre were running or not.

[spectre->[appletalk->[ST] vs. [spectre->[ST]<-appletalk]

This might not be the right place for this, but does
anyone know where I can get source code for ST uuencode
and uudecode? This will also be used on an IBM system,
some some degree of portability would be great too...

re: Atari ST VT-100 Terminal Emulator Cartridge.

Environment: Colour Mega ST 2, with SmartLink 2400 modem.

Last weekend I bought the this VT-100 Emulator from "What's This" here
in Kitchener. Yesterday when our phone was reconnected to the rest of
the world, I actually started trying to setup the emulator for a
session. I had trouble with parity and bit settings.

In my normal communications environment I use the VT-52 emulator
accessory with GEM Kermit. I set the RS232 to 7 bits, even parity,
strip bit on (1 stop bit). With the accessory I have no trouble
getting the modem to respond with OK. If I change parity fine. If
I change to 8 bit, no parity, 1 stop nit no problem with the accessory.

Now if I plug the cartridge in and power up again, I find that the only
format I can talk to the modem in is 8 bits, no parity (I assume

1 stop bit since there is no parameter in SET-UP B for it). When ever I change to 7 bits, any parity, my modem refuses to echo characters and respond with OK. I tried for an hour to get the modem to talk to the VT-100 emulator using 7 bits. No frigging luck.

Is this a bug with the cartridge program or I'm doing something wrong?

- Ant

%%%

or citi-bank method). Student discounts are on the way according to a spokesman that represents the dealer network head.

1. First off with color, can you say SPECTRUM??? (512 colors on screen at once). Can you say QUANTUM PAINTBOX??? (4096 colors on screen at once) Can you say DIGISPEC??? (24,386 colors on screen at once), Quantum even allows 32 colors in medium rez. All the above work on mmu's manufactured after early 1985, with no modifications to make inside, simply load and go! As for memory, I have personally seen an 8 meg ST in action, if at all possible, I will get the schematics on how to do it! Although the ST can do it, Atari still seems to be selling ST's under the 4 meg logo and the 16 colors logo. Both Digispec and Spectrum 512 can be obtained through Trio Engineering, or from The Catalog in Antic magazine. Quantum Paintbox is available from Eidersoft U.S.A Gray scaling is employed in many desktop publishing programs, it is also used by image scanners too.

2. Memory expansion without soldering is very easy. I wouldn't call two socket connections a 'TRICK' as you put it. Your statements about the mega is very valid though, I have still yet to see an expansion for their memory.

3. I am running a 520ST unmodified right now, after loading the raster fonts in, I have 398K free. Memory is not too much of a problem here. GDOS is great, it's about time it's available for the ST.

4. Good idea, bumper stickers are sort of like 'word of mouth' advertising. Atari would spend less money on stickers than they would on t.v. commercials.

5. I read an article about a dealer convention, student discounts were at issue, the general concensus showed everyone favored it, if this goes through, students will get approximately a 30% discount and will be eligible for the credit plan.

And a reply to the editors note, I have read an article about a prototype card box that connects to a 520 or 1040 DMA port and it acts exactly like the mega-st internal card slot expander.

@@@
COUNTER POINT TO REBUTTLE
SWANSON'S SOAPBOX (huh?)
@@@
by Rod Swanson

Jim, Sorry that you take life so dang seriously. Swanson's Soapbox was written with the Atari user in mind, not anyone else. It is meant for information and amusment. Computer slamming IS HEALTHY if done with a sense of humor and if it is restricted to OUR OWN AUDIENCE. I did not upload this to the AMIGA section trying to cause trouble. Sorry you do not see this the way I do. If you would have paid attention to the article you would have noticed that the Amiga points were by someone who once sold both machines, not I.

As for the JET review, I did not say anything that remotely suggests that WE SHOULD PIRATE the program. Please re-read the article more thoroughly again, without reading things into it that you imagine. Please focus your attention on the last 6 sentences!!. Again, sorry for offending a fellow 'ATARI' (?) user.
STya later - Rod.

PS. I will no longer pursue this subject so do not reply unless it is to yourself. No since in turning this thing into an argument.

Special Offer From The SOURCE to readers of ST REPORT/ZMAGAZINE!

Until December 31, 1988, The Source is making a special offer to readers of ST REPORT/ZMAGAZINE who want to signup for an account with *no*membership*fee*! And with this offer, you receive a $60 credit applied to your first year of usage. To take advantage of this offer, you'll need your credit card, call 1-800-336-3366 (in Virginia 1-703-821-6666). Tell the operator who answers you would like to signup under offer #7BL0U60.

In addition, you may purchase The Source Manual for $12.95 (+$3.50 postage and handling). To signup for your account AND order the manual, tell the operator you'd like to signup under offer #7BM0U60.

++++++++++++++++++++++++++++++++++++++
FIRST CANADIAN ATARI USER CONVENTION
++++++++++++++++++++++++++++++++++++++

NOVEMBER 6, 1988

This is CANADA'S first and only Atari user convention this year. This convention is being put on and sponsored by "THE TORONTO ATARI FEDERATION" user group. This group has over 500 members both in the TORONTO ONTARIO CANADA area and across the country as well as having associate members from around the world. We have a 40 meg 24hr bulletin board 416-235-0318 that has everything anyone would require when using ATARI SYSTEMS. If anyone wants more info re our computer show leave a message on the board and we will be in touch. If this is not convenient contact the people listed below.

This unique computer show is dedicated exclusively to ATARI COMPUTER SYSTEMS. This exciting new event promises to be jam packed with information, demonstrations, lectures and hands on work shops. One of the main exhibitors will be Atari Canada, showing off all the latest software as well as its new and innovative products. That's not all, there will be lots of retailers selling their wares as Special Low Convention prices, hardware and software manufacturers displaying their latest products, user groups talking to the crowds about Atari products and selling their PD software disks, lectures by knowledgeable speakers, seminars by prominent developers and even hands-on workshops where the registered participants

can actually work on projects under the guidance of an expert. There will be something for everyone. From multi-player adventure games on the 8-bit to business applications for the Atari clones. So, if you are an Atari owner, or plan to be one or just looking for information, this is the place you will want to be.

THE FIRST CANADIAN ATARI USERS CONVENTION is being held at THE SKYLINE TRIUMPH HOTEL located just off highway 401 on Keele Street. NOVEMBER 6TH, 1988 from 10:00am to 6:00pm. (Special hotel rates available) Phone: 1-800-268-1332.

==========
CompuServe PRIME/DAYTIME HOURS EXTENDED
==========

Effective Sunday, Oct. 2, CompuServe's prime/daytime will be defined as 8 a.m. to 7 p.m. CompuServe's basic connect-time rates, which are the same as prime/standard and standard/evening rates, are unchanged.

The one-hour lengthening of prime/daytime to 7 p.m. is to allow CompuServe's definition of daytime access to be consistent with that of its supplemental communications networks.

The CompuServe network surcharge will continue as one rate for all time periods. For more information about CompuServe Information Service rates and network surcharges, type GO RATES at any prompt.

NETWORK SURCHARGE ANNOUNCEMENT

Due to increased network costs, CompuServe will adjust network surcharges effective Tuesday, Sept. 6. The CompuServe network surcharge will change from 25 cents to 30 cents per hour. CompuServe basic connect-time rates will remain the same.

Members accessing CompuServe from overseas through Computer Sciences Corporation Infonet will incur a $50 per hour surcharge at all times. The TYMNET and Telenet prime/daytime surcharge will increase from $10 to $12 per hour, though the standard/evening access surcharge will remain the same. Members now using TYMNET or Telenet are encouraged to check the online phones list (GO PHONES) for a CompuServe network number in their area.

COMPUTER BULLETIN BOARDS IN THE DEPARTMENT OF COMMERCE

The Economic Bulletin Board
==========
Operating agency

Office of Business Analysis
Office of the Under Secretary for Economic Affairs
U. S. Department of Commerce

Contents
Current economic news from DoC Economic Affairs(EA) agencies including press releases, economic indicators, official DoC summaries of economic news, information on how to obtain data tapes, and summaries of reports and studies produced by EA agencies. Also included are press releases issued by the Bureau of Labor Statistics.

Open to the public without charge. No preregistration required. Operated 24 hours a day, except when being serviced.

Telephone (202) 377-3870 or (202) 377-0433

Full duplex, no parity, 8 bit words, 1 stop bit, or Full duplex, even parity, 7 bit words, 1 stop bit 300 or 1200 baud. After connect, enter 1 or 2 returns to start

State Data Center Bulletin Board
==========
Operating agency

State and Regional Programs Staff
Data User Services Division
Bureau of the Census

Contents
News about new Census Bureau programs, Census publications, reference material for State Data Center personnel. For use of the Census Bureau staff and all State Data Center Components, including affiliates. Preregistration required - call information contact below.

Operated 24 hours a day, except when being serviced. Full duplex, no parity, 8 bit words, 1 stop bit, or Full duplex, even parity, 7 bit words, 1 stop bit 300 or 1200 baud. After connect, enter 1 or 2 returns to start

Information Contact:
John Rowe or Larry Carbaugh
Bureau of the Census
(301) 763-1580

Population Estimates Bulletin Board
==========
Operating agency

Federal-State Cooperative for Population Estimates Population Division
Bureau of the Census

Contents
Information and news about population and demographic projections. For use by members of the Federal-State Cooperative for Population Estimates and members of the Federal-State Cooperative for Population Projections. No

preregistration required.

Usual hours of operation 5:00 PM to 6:30 AM Monday-Thursday, 24 hour operation from 5:00 PM Thursday to 6:30 AM Monday. No preregistration required. Full duplex, no parity, 8 bit words, 1 stop bit. 300 baud. Telephone (301) 763-5225, After connected, enter "RUN" to start.

CMIC Electronic Bulletin Board
==========
Operating agency

Census Microcomputer Information Center, Office of the Director
Bureau of the Census

Contents
Microcomputer news, software and hardware reviews, public domain software, training programs for Census and Commerce personnel. General microcomputer users; primarily internal Census Bureau personnel. No preregistration required. Operated 24 hours a day, except when being serviced. Phone (301) 763-4576.

Full duplex, no parity, 8 bit words, 1 stop bit, or Full duplex, even parity, 7 bit words, 1 stop bit 300 or 1200 baud. After connect, enter 1 or 2 returns to start

Microcomputer Electronic Information Exchange (MEIE)
==========
Operating agency

The Institute for Computer Sciences and Technology (ICST)
The National Bureau of Standards
Department of Commerce

Contents
Information on the acquisition, management, and use of small computers. Other files containing sources of information on topics such as: conferences, Federal publications and activities, user groups, other bulletin boards, etc. General microcomputer users. No preregistration required.

Operated 24 hours a day, except when being serviced. Telephone: (301) 948-5718. Full duplex, no parity, 8 bit words, 1 stop bit, or Full duplex, even parity, 7 bit words, 1 stop bit 300 or 1200 baud. After connect, enter 1 or 2 returns to start. If you do not receive a carrier after two rings, you should hang up and call again.

Climate Assessment Bulletin Board
==========
Operating agency

Climate Analysis Center
National Weather Service
Department of Commerce

Contents
Historical climate information - daily, weekly, and monthly, heating degree days, weekly climate bulletins. Users generally are Analysts using historical meteorological data.

Operated 24 hours a day. Preregistration required. Call information contact below. Full duplex, no parity, 8 bit words, 1 stop bit.

Information Contact
Vernon Patterson
Climate Analysis Center
Telephone: (301) 763-8071

East Coast Marine Users Bulletin Board
==========
Operating agency

National Weather Service
U.S. Department of Commerce

Contents
Marine weather and nautical information for coastal waterways. Information includes data for bays and sounds, coastal waters, and offshore waters; tropical storm advisories; tidal information, and important weather, nautical, and fishing news. Data are primarily about the middle Atlantic region.

Users are Commercial fishermen and other users of coastal waters. The bulletin board is open to the public and free of charge. Users must preregister by calling information contact below. Information about similar bulletin boards for other regions may also be obtained by calling the information contact.

Operated 24 hours a day. Telephone (301) 454-8700. Full duplex, 8 bit words, 1 stop bit. 300 baud.

WARNING! My responses have only good things to say about the ST, so
you Atari Haters (either the machine or the company) out there may
wish to hit the 'n' key now...

In article <379@bdt.UUCP> david@bdt.UUCP (David Beckemeyer) writes:
>I've been hearing this "dying computer" attitude from dealers, distributors,
>and even some magazine publishers (always the last to go) for several months,
>but I've been reluctant to say anything because I feared it would be construed
>as nothing more than an attempted stab at Atari. It isn't. It truly
>appears that Atari has played out their last hand.

And it could simply be that 1) May-September is a horrible selling
time for computers and software anyway, 2) a lot of people are playing
a wait-and-see game on things like the 68030 machine (or a drop in
price in RAM which may drop the price of the Mega...), and 3) there is
so much GOOD PD/Shareware software for the ST that it may really
appear to be a dying computer from the point of view of a software
developer trying to make a living off of the computer.

>I think the consumer who paid hard-earned money in hopes of obtaining
>a useful computer system is the big loser here, especially those that
>have invested lots of hardware, money, and time on the ST.

Fooey. I've wasted more money on IBM PC's and Mac's than I ever could
on my ST (or Amiga for that matter). A lot of us, early on, put $3000 plus

into an IBM PC that within years was worth less than $800. I also bought a Mac that became worthless at an even more alarming rate as Apple nickle and dimed me with their upgrades (128K->512K->??? actually cost more than the original Mac ($1900). The IBM PC lost its appeal with its 64K limitations and the increasingly buggy software that started coming out from companies like Borland, Microsoft, etc (it almost seemed to be becoming a fad as to who could rush out their product first and still get away with supplying the user with the most bugs). And the Mac was just too slow and messy to develop code on (and still be able to remember how to write code on Unix systems).

From the home user point of view, I still think the ST is best, since it is cheap, has great games :-), has better quality PD software in most areas than the IBM PC or the MAC, can integrate better with 'other' disk formats (and OS's) that the users may be using at work, and is very easy for the novice user to 'learn' to program on (via fast but simple languages like GFA Basic.) Note I haven't said anything 'nasty' about the Amiga...I like the Amiga, but it was always just a little behind (about 6 months to a year) the ST in the areas I was interested in (languages, ports of PD packages, certain games, etc). Plus when I got rid of the Amiga, I still had to deal with having to have three OS's within reach depending upon which game or application I wanted to run...which I hear isn't a problem any more.

>It seems to me that this should be a lot more troubesome to all of us
>than whether or not they have fixed the Malloc bug.

I agree, specially since I have never really seen how the 'Malloc' bug has really prevented me from doing anything on the ST as a developer. I have never lost any sleep over it or even seen the problem when using MWC. I actually have wasted more time in the other mundane bugs (like having to put character eater loops into my code to handle users that like to hold a scroll key down...else bconin bombed).

Subject: Genie vs. CompuServe
In-reply-to: Info-Atari16 Digest <Info-Atari16@Score.Stanford.EDU>'s message of
To: Info-Atari16@Score.Stanford.edu

This is strictly my own opinion.....

I've been using CompuServe for approximately 2 years, and have been, for the most part, quite satisfied with the services provided. I have however experienced some difficulty in communicating at 1200 baud (occassional trash characters).

The current rates for CompuServe are $6 per hour @ 300 baud, $12 per hour @ 1200 baud. (Because of my 1200 baud problems I've been doing almost all of my stuff at 300 SLOW, SLOW baud.)

Several months ago I saw an advertisement for Genie and decided to give it a try. Rates (non-prime time; that's the only time I use it anyway) are $5 per hour for both 300 & 1200 baud. The initial sign-up fee is $29.95 (but you get 2 free hours worth $10).

Impressions of Genie from an ole CompuServe user:

(1)

Wow! The ST roundtable is great! I expected less, but there appears to be not only more stuff, but there appears to be newer stuff than CompuServe!

(2)

The Genie menus make the CompuServe (new) menu structure look pretty sick. To me, it's MUCH easier to get around on Genie than Compuserve.

(3)

In the ST roundtable on Genie, when you go the ST libraries, you can search ALL libraries at once! [ever had the problem where you wanted to find a file, but didn't know where to look?]

(4)

I can talk to Genie @ 1200 baud error free! Don't ask me why, but I can now talk at 1200 baud error free for $5 per hour, vs $12 per hour on CompuServe with trash.

Genie is owned/operated? by General Electric. When I signed up they gave me a personal phone call to verify my order. They had a "free" genie intro manual to me in 3 days! They had a large "free" users manual to me in a week!

Genie doesn't seem to have, as of yet, a large amount of business "stuff" like CompuServe, but I don't ever use it anyway. They do have Shopping (alot of the same businesses as CompuServe), Computer roundtables, airline reservations, etc..... (a LOT of stuff I haven't looked into yet, I'm having too much fun on the ST roundtable).

A clarification here, a Genie "RoundTable" is the equivalent of a CompuServe "Forum".

Anyway, Genie has won me over, I would definately recommend that individuals give it a test flight to see for themselves.

I am in no way associated with CompuServe or Genie, I don't have time for another job!

Dennis.....

In the current issue of Computer Music Journal, there is mention of audio amplifiers with digital input so you can use there 4 times oversampling DACs. This intrigues me. What is the format for this digital interface. Could one possibly send digital information through the DMA port and use the ST as a sampler?

From: cwjcc!hal!ncoast!btb@tut.cis.ohio-state.edu (Brad Banko)
Subject: problem with mwc atoi(), version 2.0.1
To: info-atari16@score.stanford.edu

What is wrong with the following code? I am trying to make a little random number generator which will generate a list of random numbers from 1..Ni in response to a list of integers on the command line, that is (I want):

```
> rint 1500 10 30
to give: 738 4 15
```

(So I can generate random English dictionary references so that I can learn new vocabulary words to study for the GRE... to get into a good grad school, to get a great job some day, etc., etc.)

```
#include <stdio.h>
/* #include <math.h> */

#define MAXVAL 32767

main(argc,argv)
int argc; char *argv[];
{
int i, x;
extern int atoi();

for (i=1; i+1<=argc; ++i) {
x = rand();
printf("%d %d %s %d %d %d\n",
x, i, argv[i], (double) x / MAXVAL, atoi(argv[i]),
(double) x / MAXVAL * atoi(argv[i]) + 1);
}

putchar('\n');
}
```

The code compiles, but produces bad (atoi()?) results... why? Why are
the atoi(argv[i]) values bad (negative)?

```
> cc rint.c
> rint 1500 1400 1300 (produces:)
6937 1 1500 16216 -13903 -27805
27004 2 1400 16466 -1627 -3253
223 3 1300 15583 446 892
```

Thanks for your help.

Subject: Multi tasking Shell suggestions??
To: info-atari16@score.stanford.edu

Hi,

I have heard about a few different multi tasking programs that
are available for the ST. The ones I have heard of are:
MT C Shell, Gulam, OS-9 and maybe Minix.
Could anyone give me info about any or all of these programs/operating
systems? I would like to know advantages, disadvantages, manufacturers
and prices.

If there is sufficient interest I will post what I find out.

Thanks in advance.

John

Actually, they do charge for download time (Genie -> You) but they
don't charge for upload time - you are not penalized for donating software.

I haven't used the mail since most of the people I want to talk to
are on this network, but I have downloaded a fair amount of software and
much of it is good. There are also some machine specific discussions that
are pretty good. Best of all, is that there isn't an extra charge for
1200 baud (but there is one for 2400 baud), and there isn't a minimum charge.
When you decide to drop out for a month or so, you don't have to pay anyway.

Compuserve's connect charge is at least $12.50/hr for connect time
at 1200 baud - more than double what Genie costs. (Off hours that is). From
what I've heard, the software is about the same, Atari seems to be stronger
on Genie, but Mac is stronger on Compuserve, and all of the other services -
well I don't bother using them.

Contact each and compare -

Date: 15-SEP-1988 15:07:01.78
From: MAURY%LAUCOSC.BITNET@Forsythe.Stanford.EDU
To: <INFO-ATARI16@SCORE.STANFORD.EDU>

I've been off the net for a while, so correct me if anything I say in
this letter is wildly inaccurate.
In the Wednesday, Sept 14,1988 edition of this newsletter, David

Beckemeyer adds his comments to a letter posted some time before that
I didn't receive. In this letter, a user from West Germany (apparently) quotes
a displayer as saying "What do you expect of a dying computer?".
Mr. Beckemeyer then writes that "Atari has played out their last hand."
Recently I talked to a local developer who had been to a recent trade show
in West Germany and reported it to be quite a shock, as he stated that there
were Ataris "everywhere", a comment that I here from the local Atari dealership
often.
My question is this: What is the REAL sales flow in West Germany and the rest
of Europe? Considering that they seem to be a dead issue in the (very) local
area, and Mr. Beckemeyer states that this problem is in general, I feel a
little bit worried that my investment could suddenly be worth nothing if sales
really are dropping off, and continue to do so. I have bad dreams about
TI-99's and Plus 4's!
Would some kind user from West Germany who REALLY knows please confirm these
statements one way or the other? I'm sure I'm not the only user on this net
who is more than a triffle conserned!

Maury Markowitz,
MAURY@LAUCOSC.BITNET

Thanks!

>How does one go about writing a GEM program that will accept arguments to
>main via argc and argv? I'm using Mark Williams C and when I try to use
>argc and argv with a GEM program the program bombs.
>
>Thanks for any help,
>Jim Cochrane

As far as I know, with MWC 3.0 (2.1.7 also), the method for using argc
and argv from a GEM type program is to NOT use the -VGEM flag,
instead, use the -laes -lvdi options as the last part of your cc command:

cc -o myprog.prg main.o mod1.o mod2.o -laes -lvdi

As far as _I_ can tell, argv[0] is undefined, and is NOT standard K&R
from the desktop, but from the MSH shell it's OK (supposed to be the
name of the program being executed).

Subject: Don't Bash (was Re: Boycott Apple Again -- Now about Suns)
To: info-atari16@score.stanford.edu

Sorry for the gross cross posting, but I have no idea in which group
the germain posting originated. Note Followup-to.

In an article (Somebody) writes:
> ... [some Sun Bashing]

Come on Guys. You will bash anything. But let's not bash the good
guys without reason.

Yes, there are some problems reported about Sun, but name another
company that come even close in competing. (I can name a couple I
would like to see compete, but Sun is now a BIG company.)

Yes Sun's software is buggy. But not very. SunOS is administered by
one fulltime person at our site of almost 100 Suns. This is compared
to the three required to maintain 6 BSD 4.2 Vax systems three years ago.
If you want to talk about buggy, let's discuss OS 360, any release less
than 15. I seem to think MS/DOS 2.0 was bad, also, but I didn't have
intimate experience.

Would you rather buy from DEC (which had the goal of lowering the price
per MIPS to $40,000 in 1988 {10 times the SUN goal}). Basically Sun
has maintained about a 2 to 1 price performance advantage over the big
competition and continued to introduce new and improved products (like
NFS (which everyone liked) and NeWs (which wasn't so great) and SunOS
4.* which is so major a change that we won't appreciate it for years).
A recent posting in SunSpots indicated that Suns price/performance for
software maintenance was also about twice as good as DEC's.

So far Sun hasn't sued anybody. (How many companies has Apple forced
to cripple their product or sued out of the business? I have lost
count.)

Yes, you can critize some of the things that Sun does, but bashing
(implying that it is a bad company and you should not consider buying
their products) should be reserved for companies with questionable
business ethics (like suing the competition our of business because
they have a better product).

By the way, I have offered several examples concerning Apple. I do
not mean to imply that Apple is the only company conducting business
in a manner that I consider unethical.

I have also referred to DEC. This is a company that conducts business
in an ethical manner(In the main. You can find questionable examples
for any company, even Sun :-).). They are just behind the technology
curve, so their products are somewhat less desireable to me.

Thanks - Mark (davis@cs.unc.edu or decvax!mcnc!davis)
Disclaimer - I am not nor have ever been an employee of Sun
Microsystems, Incorporated. I use and recommend their products, but I use
and recommend a lot of other vendors products, too

Subject: Game Machine
To: info-atari16@score.stanford.edu

I am looking for an excellent gaming machine. (Before you get all puffy, I know
darn well that the ST and amiga are much more powerful than just a game
machine- but I have other computers that I use for work & such...) Anyways, I
am cross-posting thing to comp.sys.atari.st & comp.sys.amiga cause I can't
decide which machine I should get for home * GAMING * use. I don't care to
hear all the other aspects (most I already know) but I want to hear which has
the best games, the best graphics (in game out), etc...

I would like to here prices of people willing to sell their low-end machines
to upgrade, etc. Send me a few for-sale ads.

Thank you

FROM: #FJMORA%WMMVS.BITNET@CUNYVM.CUNY.EDU
SUBJECT: Re: Deskjet drivers

Some Deskjet drivers are already on the market or in PD.
For example, Migraph (phone (206)838-4677) sells a very good GDOS
driver along with their Easy-Draw package. Maybe it is available
separately. They give 3 screen dump utilities with this package,
one for color monitor and 2 for monochrome (one for horizontal
printing, one for vertical). Once installed, these utilities allow
you to print the screen to the Deskjet with Alt+Help.

For printing from word processors, you can download drivers for the
most popular programs (i.e. face it, the one you use is an extinct
species! :-)) from GEnie.

BTW, somebody wanted to know hoe to join GEnie. Here I repeat the ad
I found in my FLASH package:
1. Set up your modem for half-duplex, 300 or 1200 bauds
2. Dial (toll free) 1-800-638-8369. Upon connection, enter HHH
3. At the U#= prompt, enter XJM11837,FLASH and press return
4. Follow the prompts, with your credit card or checking account number handy.

Uploads are free, connexion is $5.00 an hour in non-prime time, plus
phone bill (you have better to be in a city where there is a GEnie access
line, or else it will be expansive).

Disclaimer: I have no share in any of the companies above-mentionned,
I am just a satisfy consummer. And I wrote the 1st Word Plus driver
in the GEnie Atari library, so anybody should be able to do it.

After checking the Sun bugs database I find that Purdue has called in seven
(7) bugs, of which 4 were fixed more than two releases ago, 2 are fixed in
the current release and one is fixed but it isn't in a release yet. Oh and
none of the bugs have your name on them. Do you work for Kirk Smith?

Anyway, the point is twofold :
a) We have bugs and we know it. Sending them to bugs@sun.com (sun!bugs)
and most times to Sun-spots will get them brought to our attention
and fixed.
b) Where was the content of this posting? What exactly was it that
got you so irritated?

Anyway, hope you feel better for having said it. Sorry we haven't been
able to meet your standards. We will continue to try. And of course we

need your help to point out those things that you feel are problems, as sometimes we don't see them that way and thus don't change them.

Reply-To: Friesen%PCO@BCO-MULTICS.HBI.HONEYWELL.COM
To: <@BCO-MULTICS.HBI.HONEYWELL.COM:info-atari16@SCORE.STANFORD.EDU>

I sent away (a while ago) for my upgrade to Cyber Paint 2.0. I recived it fairly soon after, however, I did not recive the new documentation. I waited a while, and decided they forgot to send it, so I wrote them a letter. A few days later I recived the documentation. Now, a while after I recieved another copy of Cyber Paint 2.0 (hence the subject, I recieved two copies of Cyber Paint 2.0). I don't know what they are doing. The new copies don't seem to be any different except for the style of disk labels they used. The all have the same files, and seem to have the same version of Cyber Paint. Well all I can say is that they were very good in sending the manual soon after I wrote them the letter. I cannot figure why they would send me another copy of Cyber Paint, so long after I recived the manual. I made it perfectly clear that I had the software, just that I did not have the documentation.

Oh well...

Subject: Reading the clock of the BMS 1000 host adaptor
To: info-atari16@score.stanford.edu

Hi!

I own a BMS 1000 host adaptor which connects my hard disk to my ST.
This adaptor has an onboard real time clock.

BMS supplies a program for the auto folder to initialise the system
clocks. Quite conventient.

However, since I boot a different operating system every once in a
while, I'l like to write a program with the same functionality for that
system.

Has anybody any idea how to read out the BMS clock? (or perhaps a piece of
code to do so ??).

Many thanks

i'm really glad that Sun doesn't meet this weenoid's standards!

Sun is *very* impressive. both with regards to current
computing industry standards and in historical perspective
with the DEC of the 70s and earlier.

buy their machines and their stock and you won't do wrong!

(i'm not employed by Sun, but i'll take a spare 386i, if
they've got one lying around).

What about the other way 'round? Given a WORM drive (I guess one could
be connected to the SCSI interface) can one write a CD which will play
on an audio machine? I wouldn't mind archiving some of my old 45's. I
know they would still sound like an old 45, but at least they wouldn't
get damaged any further.

Subject: Re: Boycott Apple Again
To: info-atari16@score.stanford.edu

The clue to the cause of these price increases is in the percent
increase of the memory expansion. In the past year, the cost of memory
devices has more than trippled. Anything and everything that uses
dynamic RAMs is more expensive and will continue to be until the prices
go down. Since all of the Apple Macs have a minimum of 1 Meg of memory
(the Mac II has more), price increases are inevitable. I just priced a
memory board for the IBM PC and the price had went up $100 since I
checked a month ago. So, if you're buying ANYTHING that has RAM, it's
gonna cost ya some major bucks, with no end to the shortage in sight.
In fact, the prices are still going up.

Subject: This "Dying ST" nonsense
To: info-atari16@score.stanford.edu

I don't know where this "The ST is a dying computer" bull is coming from, but it certainly isn't the case around here. Our ST sales are as brisk as ever, hampered only by the fact that we can't get enough 1040's to meet the demand!

David Beckemeyer claims that ST sales are now only 20% of BDT's business. I submit that that's because, powerful as they are, BDT's products are a pain in the gluteus maximus to use. I mean, we're talking about a machine with a windows-mouse-icons interface here. Most ST buyers are looking for programs that DON'T require a command-line interface or a lot of manual-reading to use. Yeah, I know that's not the case with a lot of the ST users on the net, but we AREN'T typical ST users. I sell the things; I see who buys them. And I have to teach these people things you'd think your average cocker spaniel would intuitively grasp, day in and day out.

Atari has found their market. The great silent majority. The same folks who voted for Reagan, read The Enquirer, and made The Gong Show a hit. There's a lot of them out there...

(Sorry if I sound bitter, I just get tired of working with the brain-dead.)

I think it's coming from Apple and places like that. I'm sure that they would like the world to believe that the ST is dying and or died. I don't see that at all.

>David Beckemeyer claims that ST sales are now only 20% of BDT's business.
>I submit that that's because, powerful as they are, BDT's products are a
>pain in the gluteus maximus to use.
I agree. David has written a good set of programs but I think he is ahead of the ST group. The other point is so what. I have look at his stuff and I don't think it meets my needs. DBT products do not have a lock on the ST world so they do not represent the state of Atari.

>Atari has found their market. The great silent majority. The same folks
>who voted for Reagan, read The Enquirer, and made The Gong Show a hit.

Now this makes me mad. I read the Oregonian, watch the Love Connection
and voted for Mickey Mouse. (I think he won)

>would fix the media change bug.

Replacing the drive would fix the problem if you had one. The
behavior you describe is the *normal* behavior for a stock ST. The
media change bug exists when a write-ENABLED floppy disc is removed,
and another disc inserted, and the machine does not detect the change.

The glitch on the write protect line, which TOS polls during VBI,
(Vertical Blanking Interrupt) isn't long enough to be detected with
write-protected discs. However, it isn't a serious problem since you
can't write to the disks and therefore won't clobber them.

Subject: IBM Disk Interchange Problems
To: info-atari16@score.stanford.edu

Anyone want to take a stab at this perplexing hardware problem?

HARDWARE:
-520ST with 1MB upgrade.
-A: drive - original double-sided SF314 (Epson mechanism).
-B: drive - TEAC FD55BV 40-track 5.25" (IB Drive)
-Compaq 386 clone with 720K/1.44M 3.5" drive
-Both Atari disk drives run at 300 rpm (+/- 0.5) and seem to be in good alignment as evidenced by easy interchangeability of disks with other Atari users, even with extended disk formats. The PC drive has no trouble with inerchange of even 1.44 MB disks with other AT users.

SOFTWARE:
-pc-ditto configured for 3.5" A: drive and 5.25" B: drive; name your DOS.
-TOS, 4/22/87 version, with verified pokes applied to change drive B: step rate to 6 ms (I've tried it with 12, too).

SYMPTOMS:
-5.25" B: drive works fine for minutes to an hour or so, depending on degree of activity. Suddenly it refuses to read or write reliably; DOS reports "drive not ready"; TOS reports "the data on drive B: may be damaged". Has happened during disk copy operations, so I can verify it's affected both inner and outer disk tracks on the first sign of trouble.
-3.5" A: drive works _perfectly_ in Atari mode. However, if the Atari writes to an PC-formatted disk past track 65 or so, a PC then has trouble reading the disk past that point. The Atari has _no trouble_ reading all 80 tracks of a disk formatted on the PC, but once it writes to that disk past track ~65, the PC can no longer read it.

WHAT I'VE TRIED:
-Swapped cables: Oh, come on. You have to ask?
-Clean the heads: Yes, and inspected them with a mirror to be sure.
-Tried the IB drive on someone else's Atari: Cannot reproduce the 5.25" problem, even after hours of testing.
-Tried the IB drive mechanism on my PC: Yep, it works 100%
-Tried the Epson 3.5" mechanism on my PC: Yep, that works too.
-Tried a different 3.5" drive on the Atari: Well, my original B: drive is another SF314. Same problem, same starting track #.
-Looked for thermal problems: Nothing gets especially hot. Yet, the time-related start of this 5.25" stuff sure makes me THINK something is overheating.

WHAT I SUSPECT:
I know the Atari disk controller setup is a total kludge, what with unbuffered select lines coming off a SOUND CHIP and all. It sure sounds to me like it's a wee bit flaky but I have no way to test it. I've also hear things about write precompensation on diskette drives too, and wonder if the track 65 stuff might have something to do with that. Any of you disk drive mavens care to lend a hand? Thanks!

>
> This is damning with faint praise. Not only does Atari need to stop
>making announcements too far in advance, they also need to release new products,
>especially those they have been talking about for so long.

It's really ironic. At the last major computer show, Atari, following its new no-vaporware policy, did *not* display the non-product ABAQ, nor the rumored 68030/*nix box. This was immediately interpreted as a product cancellation by many. In fact, it represents a verifiable commitment on the part of Atari to *not* show unavailable products.

Sometimes, you just can't win, no matter what you do.
>
> Unfortunately Neil Harris was also hinting about something new on the
>horizon. I would love to see all the good things Roy's talking about, I hope
>I will see them, most of the time I think I will see them. But until I can walk
>into a store and buy them, they're just talk.

There's good news. For the first time that I can remember, I have seen a television commercial for the Atari 1040ST! It was shown in the San Francisco area, I think at 6:30 last Saturday, I can't recall the station. The advert compared the cost/byte of the 1040 versus the Macintosh and the IBM PC, and displayed the slogan "Business is War".

I saw a second commercial later in the week for the 7800 video game. It seems that Atari has decided that there *is* a market worth persuing in the U.S.

Furthermore, Atari is becoming a strong presence at Desktop Publishing conferences, with the lowest-priced entry-level system.

> A company's support is important to user's and developer's (and

>way, a good cycle or a bad cycle begins with the manufacturer.

Yes, but part of that developer support includes not obsoleting a company's current products by making changes to the O.S. which break

existing software. Atari has demonstrated their understanding of that fact, even in the face of the pressure seen here and elsewhere to do otherwise. That is *true* developer support.

Atari has placed the value of end-users with an investment in software over the wishes of a few of us knowledgable about the internals of the system. The perception of the outside community, that Atari improved the operating system without breaking existing code, will be worth far more in the long run than a few insiders knowing that they did it "right", but broke dozens of products.

> What's so terrible about this? Isn't it usual to expect a company
>to help the customer, whether he be a user or a developer. I'm sure David
>is aware that negative comments may affect sales. However, in the long run,
>being honest about a company's problems as well as it's strengths makes your
>opinion worth hearing. Ignoring the problems won't make them go away.
>Support has to work both ways.

Atari Corp. is ready, willing, and able to help the customer with a legitimate problem with their hardware. They cannot be held responsible for defects in software they didn't write. They also can't help customers who don't tell them there is a problem. We see a lot of that on the net: someone has a hardware problem, and immediately gripes to the net, before he has even contacted Atari about a fix. How is that fair to Atari?

I have yet to see *anyone* complain that they went to Atari for help, and came away unsatisfied.

Two products I know which let one create large ram disks are:

Shadow (from Antic, reset proof on a Mega)
Hybriswitch (from Hybrid Arts, and I think there is a shareware
version of it floating around, also reset proof on Mega).

Hope that helps a bit!

DanSmith IslandGraphics 4000CivicCenterDr SanRafael MarinCo CA 94903 4154911000

Go ahead, save those dollars and buy a SUN, they just raised their prices
too. So getting a SUN station, will cost you another $1000 or more too.
(BTW what software you going to use on this SUN thats reasonably priced)

I think this is funny, everyone has known for a long time that prices in
the Electronics industry have been going up, how long do you think that
Companies are going to continue to absorb these costs before doing just
what Apple, SUN, and many other companies just did "raise prices".

> unusable, but altogether adding up to too many headaches....

I would not base a decision on whether to buy a Sun on this. One should
know/understand that:

1. many reported "bugs" and problems filter out as improper installations,
configurations, etc. This may be a commentary on quality of the docu-
mentation, but there is nothing unusual about Sun's;
2. In my experience, Sun users/owners are more likely to utilize third-party
hardware than users/owners of other vendors' machines. It is almost
inevitable that one will eventually encounter problems relating to this
fact alone;

3. Suns are frequently networked to other vendors' machines through still
other vendors' comm. equipment. Problems arise in interoperability.
Sun users/owners typically find that they can tackle the problems more
easily from the Sun side than from the other vendors' side;
4. The sun-spots digest is much more active than other manufacture-speci-
fic groups, which relates in part to the technical level of people who
up to now have formed one of the primary markets for Sun. I don't see
the percentage of "problem" messages to total messages in that group
to be significantly higher than in other manufacture groups. But there
is certainly much more traffic overall.

For several years, our site utilized a cpu from a vendor with an excellent
reputation for quality and support. This vendor was conscientious enough to
publish a quarterly book, containing the 100's of known bugs, there status
and disposition. A casual glance at this volume would convince someone that
the system was virtually unusable. But even tho it was used for applications
development, we rarely encountered a reported problem.

Sun's systems my suffer from more bugs than usual. I have used a Sun, know
a number of people who own one or more, and have not seen anything that would
validate a claim of severe flakiness.

>Given a WORM drive (I guess one could
>be connected to the SCSI interface) can one write a CD which will play
>on an audio machine?

WORM disks are physically different than CDs, as far as I know. So unless
the WORM drives change, which probably won't happen in the very near future,
you won't be able to record a standard-format CD. This isn't to say that
someone won't come up with a device to play WORM disks as you describe.

>I wouldn't mind archiving some of my old 45's. I
>know they would still sound like an old 45, but at least they wouldn't
>get damaged any further.

With a fairly high sampling rate, you can digitize your 45's on a computer
and then store huge datafiles on a WORM for later playback. A Mega 4 has
enough memory to provide a couple minutes of playback, I would imagine,
more than enough time to load your buffer with the next few minutes. At
200 megabytes per WORM (at least that's what the WORM at work can store),
that's a few 45's per disk.

Of course, the ST's filesystem isn't what you want to use (even if you could use it unmodified on a write-once device), since it can't handle more than sixteen megabytes per device. I've got a few ideas about what sort of system you might want to use, but I'll spare you the details unless you want them.

These are my opinions, and in no way reflect those of UCSC, which are wrong.

Subject: Re: HARD DISK: HELP OFFERED AND WANTED
To: info-atari16@score.stanford.edu

The problem that you are having might be caused by the Xebec 1410 controller. The 1410 only handles two drives with the same parameters, i.e. heads, cylinders, seek rate, and etc.. This is not the case with the Adaptec ACB-4000 controller which will handle two different hard drives. Also I might add the Adaptec is faster with its 1:1 interleave than the Xebec's 1:3. The Atari host adapter could also be your problem. Atari host adapters do not pass back SCSI/SASI status(error) codes properly. This causes hard disk boot software to install "phantom" drives on the system. To get around this problem ICD's software only installs one hard drive on Atari host adpaters. I hope this helps you and other people on the net.

We have received numerous Usenet letters to us in the last months, but do to one thing or another I seem to get most of my mail sent back. If you need some information from us please send us a postcard. Do to our move (yeah!!) we have a P.O. box for correspondence.

Subject: Re: OSS (was Re: Personal Pascal Registration problem)
To: info-atari16@score.stanford.edu

Not long ago the programmer who wrote the Personal Pascal compiler
left a message that he had not received a royalty payment from OSS in 17(?)
months, and that the new version he had completed would not reach the U.S.

Did anyone happen to save a copy of that posting? It has scrolled off
the end of our spooler, and my own copy is gone. I am the registered owner of
two copies of this program, and I'd like to append a copy of the posting in
question to a letter I am writing to ICD.

It's a royal pain to be on the wrong end of shabby business practices!

Subject: AstroCal Printing Problems
To: info-atari16@score.stanford.edu

I have received a couple of letters from people having difficulty getting
AstroCal to print to a printer...

For the calendar and all of the reports, when you get the dialog box
asking you for the date of the calendar or report, there is a button marked
PRINTER. If you select this button with the mouse the output should go
to the printer. This is the case with the first version of the program
that I posted and the new version also.

If this doesn't work, please let me know.

Eric Terrell

With eternal2 you can use the spec <drive>fff (or <drive>???, I can't
remember which) to get the max size. I have gotten eternal2 to work with
the MEGA ROMS as follows:

1. To resize: Hold both the alternate key AND the right shift down.
2. To remove: Hold both the left shift key AND the right shift key down.

I have no idea why one must hold down the right shift key. According to
my documentation this should not be necessary. It is not necessary to

do so using the earlier versions of TOS.

Subject: New version of GS-Point released

The new version of GS-Point, v0.61, has finally been released. For those who
don't know, GS-Point is a non-commercial package that allows an Atari ST user
to act as a FidoNet point, and receive and send network mail and echomail.

New features in v0.61 include:

o A completely redesigned user interface. The new full-screen
interface is much more intuitive and easy to use than the old
one.

o GS-Point now knows about zones and can correctly handle messages
coming from and going to other zones.

o Password-protected netmail sessions are now supported for both
WaZOO and "LoTek" sessions.

o GS-Point can now be invoked in a "poll-only" mode from a batch
file or scheduler.

o GEM-based text editors can now be used to edit messages, as well
as TOS-based editors.

GS-Point v0.61 is available for file request and for first time download on
FidoNet node 1:321/112 (BBS phone (413) 253-5518) as GSP-061.ARC or as the
magic filename GSPOINT. File requests are accepted at all times except
between 4am and 6am EDT.

> I have the media change bug on my Mega 2. (The escape key does not always
> update the drive A directory when write protection is enabled).

From what you describe, you don't have the bug.

To diagnose this bug, you put a write-enabled disk in the drive and open
a window on it. Then you wait for the access light to go out. Now take
the disk out and put it back in, then hit escape. If the drive doesn't
spin, you have the bug.

For TOS 1.4, diagnosis won't be so easy, because hitting ESC on the
desktop ALWAYS causes the disk to spin -- it causes media change on the
drive, to take care of the possibility that you changed the disk while
it was out of the drive.

In the case of write-protected floppies, it is normal for the ESC key to
cause a quick response if the drive was accessed within the last second
and a half: this is a "grace" period so we aren't checking the serial
number on every single access.

Subject: umoria 4.87 for Atari ST
To: info-atari16@score.stanford.edu

I promise to be a good boy from now on, but I can't resist posting a character with an interesting life story. He has lived all his life on an Atari 1040 ST. He has survived 3 rounds of major bug fixes, and the only bugs he's seen in the last 20+ hours of play have been Killer beetles. The program which constitutes his world is presently being posted in comp.binaries.atari.st. The moderator of comp.sources.atari.st has ordinary diffs between the source posted in comp.sources.games and that compiled with Mark Williams C v 3.0.6 to produce this version (they aren't very big; however ST curses is not included--it's fairly easy to find on BBS-s); whether he posts the diffs is up to him.

I am willing to US Mail executable and complete modified source (plain, arc-ed, or arc-ed and uuencoded: say which) to anyone who maintains a uucp-accessible archive mail-server (like lakesys) or to anyone who maintains appropriate archives on a machine which allows the general public to log in and use the archive (like killer) (Bill Wisner already has the sources, but I have no idea if he intends to put them in the archives on killer). If you meet one of these conditions and want the stuff, email me: I buy disks & postage. If you have a good story why nothing else will work, and you don't meet the above qualifications, email me and maybe we can arrange something on your dime.

Re-emphasizing something I've said before: the ST version of umoria 4.87 is large enough to require at least 1 meg, and it runs under a command line processor.

Subject: Re: This "Dying ST" nonsense
To: info-atari16@score.stanford.edu

I don't have any figures, but looking at out local stores, I'd say the ST
is not dying. The STs and Megas are selling, as is software, there is
no market growth. In the computer industry, stability looks like slow death.
This is exaggerated by the fact that Amiga sales have been picking up for
a while (but I suspect they wil slow as well).

As for Beckemeyer, I would agree that his sales are not a good barometer of
the ST market. He deals in tools, and business systems--two areas where the
ST is pretty much locked out (until there are PC compatible card cages and
co processor boards) because there is not the huge customer base. I also
suspect that to some degree, BDT products have reached some saturation point.
And BDT sells PC baced systems, which obviously are more attractive than ST
systems.

>demand!

Nice to hear, especially from a dealer. Now let's get Atari to crank up
that distribution/advertising shortfall in the US, eh?

>David Beckemeyer claims that ST sales are now only 20% of BDT's business.
>I submit that that's because, powerful as they are, BDT's products are a
>pain in the gluteus maximus to use.

Good point! I hope BDT doesn't go crazy at me for saying this, but I had
to get an ST word processor over the summer. After looking at everything out
there (especially at WordPerfect for the ST, what with all the "big software
house making ST titles" hoopla), I settled on ... WORDUP!

Maybe this is just a sign that (currently) the majority of the Joe ST-user
public does not _want_ or _need_ all the features of WordPerfect (especially
at the price). Forget piracy, forget "dying ST" theories, people will buy what
they NEED. And if they don't need WordPerfect, well...

>Atari has found their market. The great silent majority. The same folks
>who voted for Reagan, read The Enquirer, and made The Gong Show a hit.
>There's a lot of them out there...

Silent majority, yes (all of us who keep harrassing stuck-up Apple dealers
can relate). Voting for Reagan, no B-). The Gong Show, definetely!

>(Sorry if I sound bitter, I just get tired of working with the brain-dead.)

'sokay, I can relate.

--R.J.
B-)

P.S. And if I haven't already, let me give an unsolicited endorsement to
Neocept's WORDUP. A very good GEM-based word processor, with _lots_ of
potential to do even better (is it true that Neocept is currently doing a
total rewrite of the program?). Fun to use, even if it is GDOS-based (all
that RAM for fonts!), and the multiple fonts and graphics make it just like
those fancy-dang overpriced Macintosh WPs.
(If only this was released two years ago -- YOW!)

Subject: Re: Boycott Apple Again -- Now about Suns
To: info-atari16@score.stanford.edu

I think that this discussion has gone quite astray. Suns and Macs are, for 99.5% of the computing world, oranges and apples.

A Macintosh is designed to be a standalone personal computer that will basically run correctly from the moment it is turned on. It is designed around the assumption that the user is not very sophisticated about computing.

Suns are diskless workstations, which can be given local disks to allow them to run in standalone mode. A Sun can only be used easily when there is a sophisticated system manager available who will work out the kinks in issues like swap space, disk partitions, etc.. If you are such a person or are part of an organization that already has such a person, a Sun may be a good choice. There is lots of free software that runs on Suns and is useful. For much of it, though, you may need to run make, extract shell archives, and run dbx from time to time. However, I don't think you can find a $150 WYSIWIG word processor for the Sun that will print on a $500 dot matrix printer.

In my experience, the only time that Suns and Macs become comparable is when you talk about the bottom of Sun's line (3/50 with a 70meg SCSI disk) and the top of Apple's (Mac II with 80Meg disk, A/UX, 5+Meg of RAM).

Network based Sun systems do appear to be more fragile than Macintosh systems (which do not depend on the network for critical resources, like virtual memory). Some of the fault lies with Sun's decision to trade-off reliability for speed and simplicity in the Network File System. But much of the time, any problems arise from the decisions made by the administrators of the local system to spend $5000 on a new 3/50 instead of another 4 Meg of memory for the file server. A Sun is a good machine if you are a programmer or can afford to hire one. A Mac is a good machine no matter who you are, but is not as good as a Sun for computer science research and some other technical pursuits.

Pardon my little harangue,

Ethan Munson

>argc and argv with a GEM program the program bombs.

Although I don't use MWC myself, I will make a few remarks:
1) There is no means that I know of to supply parameters to a Gem
program if it is started from the Desktop.
2) If the program is started from a shell, the shell should be a Gem
program, otherwise the program cannot use Gem functions. I'm not very
sure about this one, though.
3) You don't need to do anything different for a Gem program than for
a Tos-Takes-Parameters one.
4) The bus error is perhaps caused by incorrect treatment of the
argc,argv list, e.g. accessing an element argv[i], with i >= argc,
or argv[0], whose contents is undefined (GEMDOS does not pass the
program's name). I even think there are compilers that put a null
pointer (not an empty string pointer) in argv[0], which is in effect
incorrect - argv[argc] should be the first null pointer of the list.

Manually compare the tos and gem runtime startup modules. Sources are
provided with Mark Williams C. You might also try linking directly with tos
startup instead of gem startup. The the only thing you have to remember is
that linking with -VGEM also includes the Gem library. Link with something
like;

ld -s -o output lib/gcrts0.o objectlist -lvdi -laes -lc

That should do it.

> You might start by reading the sun-spots digest - you'll see enough bug
> reports to make your eyes bug out.

Well, I've made my share of postings to Sun-Spots, but I surely
wouldn't want them misinterpreted as advising people against buying
Suns. Reading an unedited list of problems from users is always a
frightening experience. The monthly listing of bug reports from DEC
for TOPS-20 was far scarier than Sun-Spots. (Presumably the same is
true with VMS, but I don't look at those.) Back when I looked at bug
reports published by IBM for MVS, it was amazing what sorts of bugs
there were even in that very reliable system. (They even had this
special mechanism for giving you last-minute information on which of
the patches they published shouldn't be installed because they turned
out to create more problems than they solved.) About all one can say
is that there are lots of users out there trying lots of things and so
they run into lots of problems. Many of them are user confusion, but
there are also plenty of bugs. Sun-Spots is mostly a sign of a large
and active user community doing lots of interesting things.

Subject: Re: Apple Talk and Ethernet

To: info-atari16@score.stanford.edu

! There are a couple (at least) of products out that allow you to
!connect an AppleTalk Network to Ethernet. If you did have an AppleTalk
!compatible port on the ST you could then hook it to Ethernet. Of course
!..... If you want Ethernet it is probably going to be
!cheaper to design something to run off the DMA bus instead of going
!through an AppleTalk to DMA converter.
!
! Dan Moore

*Someone asked about ethernet for the atari ST. We (our group at Delft
*University) are currently inquiring about the German product. It is
*supposed to be used at the University of Aachen. I hope to hear from
*it next week. When I hear something, I will post it.

*Hans Buurman

So close yet so far...

BMB Canada made and sold (2?) "ST-network to-PC" dma boxes
called imaginet but the product is no longer available (I just
called 9/15/88).

There seems to be a German ethernet card but how do you get it?

MAYBE SOMEONE AT ATARI CAN SHED SOME LIGHT ON OBTAINING
NETWORKING FOR THE ST?????

maybe this is the kind of product for the entrepeneur (like
MagicSac?)
speaking of which ....
if you had a Spectre 128 AND a DMA-2-SCSI board could you then
run a MAC ethernet or appletalk?

>table to the executable, if you do specify it, no symbol table is produced.

'-s' does not stand for symbol / no symbol, but for strip. This option
is passed to the loader, and means: strip off the symbol table. The
default in Unix is to have a symbol table in your executable (so the
debuggers are not too bad to work with, although -g is preferred if you
want to use dbx).

> This means that to make executables without symbol tables, one cannot use
>GCC, but has to invoke everything manually. Also, all the executables from

>save several KB, which might help people suffering from storage/memory
>shortages.

I do not quite understand your problem. Put the -s in your makefile, or
add -s to CFLAGS. Now you can invoke make with no special parameters.
As for removing symbol tables, that's a job for strip(1); no doubt there'll
be an ST version soon (if it isn't already there).

> Anyway, thanks to John for his impressive work !

I fully agree.

Leo.

Subject: Re: problem with mwc atoi(), version 2.0.1
To: info-atari16@score.stanford.edu

In article <12562@ncoast.UUCP> btb@ncoast.UUCP (Brad Banko) writes:
|
|What is wrong with the following code?
[some lines deleted]...
|#include <stdio.h>
|/* #include <math.h> */
|
|#define MAXVAL 32767
|
|main(argc,argv)
| int argc; char *argv[];
|{
| int i, x;
| extern int atoi();

```
|
| for (i=1; i+1<=argc; ++i) {
| x = rand();
| printf("%d %d %s %d %d %d\n",
| x, i, argv[i], (double) x / MAXVAL, atoi(argv[i]),
| (double) x / MAXVAL * atoi(argv[i]) + 1);
| }
|
| putchar('\n');
|}
|
|The code compiles, but produces bad (atoi()?) results... why? Why are
|the atoi(argv[i]) values bad (negative)?
```

The arguments supplied to printf() are not conforming to the format:
(double) x / MAXVAL is of type double (probably 8 bytes on the stack),
while you try to print it as an integer (%d) (2 bytes in mwc ?). So the
first three arguments print correctly, but the last three are taken
wrongly from the stack, and besides are interpreted wrong (as integer,
but they are double,int, double. Using a cast (int)(double expr.) for the
double expressions should solve your problem.

Subject: re: Ram disks > 999k
To: info-atari16@score.stanford.edu

I got a copy of MegaMatic off of DELPHI and it is great

optional features at config time

* reset surviving ramdisk up to 2Meg in size
* built in screen saver
* Disk verify on/off
* Print spooler (I never used this)
* key sequences for rebooting (warm/cold)

I have used it extensivly to develop a large project for the Megas
and have not had any problems. I usually use a 1.2Meg one on a Mega4.

The program is copyright Lloyd Pulley 1988 TIF Software.
The version I use is 1.15.

Hope this helps

Hedley

> printf("%d %d %s %d %d %d\n",
> x, i, argv[i], (double) x / MAXVAL, atoi(argv[i]),
> (double) x / MAXVAL * atoi(argv[i]) + 1);

The way printf picks up arguments is as follows:
%d = Pick up 2 bytes of x (which is an int) = OK
%d = Pick up 2 bytes of i (which is an int) = OK
%s = Pick up a pointer to a string argv[i] = OK
%d = Pick up 2 bytes of the 8 bytes that correspond to the value of the
expressiion "(double) x /MAXVAL".
%d = Pick up the next 2 bytes from the previous double-precision value
%d = Pick up the 4th and 5th bytes of the double-precision value
\n = Start a new line (which ignores the 7th and 8th bytes of the first
double precision result, and ignore the 2 bytes of the atoi value,
and ignore the 8 bytes of the 2nd double-precision floating point value.

The problem is in the use of %d with double. You should be using %f
for double, however you don't need double in this program; use ints and
longs instead.

To: info-atari16@score.stanford.edu

In the referenced article, Dale Schumacher referred to the GNU redistribution
conditions. He was close, but a bit off. In the gnu.gcc newsgroup RMS stated
that he considers the GNU 'copyleft' (essentially meaning free availability
of all source code) to apply to anything that is a 'derivative work' of
a Free Software Foundation product. That's a technical legal term there, and
right now the best guess is that it means BISON output or anything linked
with the GNU libraries, but not anything simply compiled with gcc and
the associated tools.

Subject: Re: Boycott Apple Again -- Now about Suns
To: info-atari16@score.stanford.edu

I think that this discussion has gone quite astray. Suns and Macs are, for 99.5% of the computing world, oranges and apples.

A Macintosh is designed to be a standalone personal computer that will basically run correctly from the moment it is turned on. It is designed around the assumption that the user is not very sophisticated about computing.

Suns are diskless workstations, which can be given local disks to allow them to run in standalone mode. A Sun can only be used easily when there is a sophisticated system manager available who will work out the kinks in issues like swap space, disk partitions, etc.. If you are such a person or are part of an organization that already has such a person, a Sun may be a good choice. There is lots of free software that runs on Suns and is useful. For much of it, though, you may need to run make, extract shell archives, and run dbx from time to time. However, I don't think you can find a $150 WYSIWIG word processor for the Sun that will print on a $500 dot matrix printer.

In my experience, the only time that Suns and Macs become comparable is when you talk about the bottom of Sun's line (3/50 with a 70meg SCSI disk) and the top of Apple's (Mac II with 80Meg disk, A/UX, 5+Meg of RAM).

Network based Sun systems do appear to be more fragile than Macintosh systems (which do not depend on the network for critical resources, like virtual memory). Some of the fault lies with Sun's decision to trade-off reliability for speed and simplicity in the Network File System. But much of the time, any problems arise from the decisions made by the administrators of the local system to spend $5000 on a new 3/50 instead of another 4 Meg of memory for the file server. A Sun is a good machine if you are a programmer or can afford to hire one. A Mac is a good machine no matter who you are, but is not as good as a Sun for computer science research and some other technical pursuits.

Pardon my little harangue,

Ethan Munson

Although I don't use MWC myself, I will make a few remarks:
1) There is no means that I know of to supply parameters to a Gem
program if it is started from the Desktop.
2) If the program is started from a shell, the shell should be a Gem
program, otherwise the program cannot use Gem functions. I'm not very
sure about this one, though.
3) You don't need to do anything different for a Gem program than for
a Tos-Takes-Parameters one.
4) The bus error is perhaps caused by incorrect treatment of the
argc,argv list, e.g. accessing an element argv[i], with i >= argc,
or argv[0], whose contents is undefined (GEMDOS does not pass the
program's name). I even think there are compilers that put a null
pointer (not an empty string pointer) in argv[0], which is in effect
incorrect - argv[argc] should be the first null pointer of the list.

Leo.

Manually compare the tos and gem runtime startup modules. Sources are
provided with Mark Williams C. You might also try linking directly with tos
startup instead of gem startup. The the only thing you have to remember is
that linking with -VGEM also includes the Gem library. Link with something
like;

ld -s -o output lib/gcrts0.o objectlist -lvdi -laes -lc

That should do it.

> You might start by reading the sun-spots digest - you'll see enough bug
> reports to make your eyes bug out.

Well, I've made my share of postings to Sun-Spots, but I surely
wouldn't want them misinterpreted as advising people against buying
Suns. Reading an unedited list of problems from users is always a
frightening experience. The monthly listing of bug reports from DEC
for TOPS-20 was far scarier than Sun-Spots. (Presumably the same is
true with VMS, but I don't look at those.) Back when I looked at bug
reports published by IBM for MVS, it was amazing what sorts of bugs
there were even in that very reliable system. (They even had this
special mechanism for giving you last-minute information on which of
the patches they published shouldn't be installed because they turned
out to create more problems than they solved.) About all one can say
is that there are lots of users out there trying lots of things and so
they run into lots of problems. Many of them are user confusion, but
there are also plenty of bugs. Sun-Spots is mostly a sign of a large
and active user community doing lots of interesting things.

From: stride!tahoe!wheeler!mikew@gr.utah.edu (Mike Whitbeck)
Subject: Re: Apple Talk and Ethernet

To: info-atari16@score.stanford.edu

! There are a couple (at least) of products out that allow you to
!connect an AppleTalk Network to Ethernet. If you did have an AppleTalk
!compatible port on the ST you could then hook it to Ethernet. Of course
!..... If you want Ethernet it is probably going to be
!cheaper to design something to run off the DMA bus instead of going
!through an AppleTalk to DMA converter.
!
! Dan Moore

*Someone asked about ethernet for the atari ST. We (our group at Delft
*University) are currently inquiring about the German product. It is
*supposed to be used at the University of Aachen. I hope to hear from
*it next week. When I hear something, I will post it.

*Hans Buurman

So close yet so far...

BMB Canada made and sold (2?) "ST-network to-PC" dma boxes
called imaginet but the product is no longer available (I just
called 9/15/88).

There seems to be a German ethernet card but how do you get it?

MAYBE SOMEONE AT ATARI CAN SHED SOME LIGHT ON OBTAINING
NETWORKING FOR THE ST?????

maybe this is the kind of product for the entrepeneur (like
MagicSac?)
speaking of which ....
if you had a Spectre 128 AND a DMA-2-SCSI board could you then
run a MAC ethernet or appletalk?

>table to the executable, if you do specify it, no symbol table is produced.

'-s' does not stand for symbol / no symbol, but for strip. This option
is passed to the loader, and means: strip off the symbol table. The
default in Unix is to have a symbol table in your executable (so the
debuggers are not too bad to work with, although -g is preferred if you
want to use dbx).

> This means that to make executables without symbol tables, one cannot use
>GCC, but has to invoke everything manually. Also, all the executables from

>save several KB, which might help people suffering from storage/memory
>shortages.

I do not quite understand your problem. Put the -s in your makefile, or
add -s to CFLAGS. Now you can invoke make with no special parameters.
As for removing symbol tables, that's a job for strip(1); no doubt there'll
be an ST version soon (if it isn't already there).

> Anyway, thanks to John for his impressive work !

I fully agree.

Leo.

Subject: Re: problem with mwc atoi(), version 2.0.1
To: info-atari16@score.stanford.edu

In article <12562@ncoast.UUCP> btb@ncoast.UUCP (Brad Banko) writes:
|
|What is wrong with the following code?
[some lines deleted]...
|#include <stdio.h>
|/* #include <math.h> */
|
|#define MAXVAL 32767
|
|main(argc,argv)
| int argc; char *argv[];
|{
| int i, x;
| extern int atoi();

```
|
| for (i=1; i+1<=argc; ++i) {
| x = rand();
| printf("%d %d %s %d %d %d\n",
| x, i, argv[i], (double) x / MAXVAL, atoi(argv[i]),
| (double) x / MAXVAL * atoi(argv[i]) + 1);
| }
|
| putchar('\n');
|}
|
|The code compiles, but produces bad (atoi()?) results... why? Why are
|the atoi(argv[i]) values bad (negative)?
```

The arguments supplied to printf() are not conforming to the format:
(double) x / MAXVAL is of type double (probably 8 bytes on the stack),
while you try to print it as an integer (%d) (2 bytes in mwc ?). So the
first three arguments print correctly, but the last three are taken
wrongly from the stack, and besides are interpreted wrong (as integer,
but they are double,int, double. Using a cast (int)(double expr.) for the
double expressions should solve your problem.

Leo.

The way printf picks up arguments is as follows:
%d = Pick up 2 bytes of x (which is an int) = OK
%d = Pick up 2 bytes of i (which is an int) = OK
%s = Pick up a pointer to a string argv[i] = OK
%d = Pick up 2 bytes of the 8 bytes that correspond to the value of the
expressiion "(double) x /MAXVAL".
%d = Pick up the next 2 bytes from the previous double-precision value
%d = Pick up the 4th and 5th bytes of the double-precision value
\n = Start a new line (which ignores the 7th and 8th bytes of the first
double precision result, and ignore the 2 bytes of the atoi value,
and ignore the 8 bytes of the 2nd double-precision floating point value.

The problem is in the use of %d with double. You should be using %f
for double, however you don't need double in this program; use ints and
longs instead.

PRESS RELEASE 9/15/88
~~~~~~~~~~~~~~~~~~~~

In an article called Atari News and Comment in the September Michigan Atari Magazine (MAM), editor Bill Rayl again blasted a non-participating local Michigan Atari users group for policies not in tune to MAM's liking.

MAGIC, the eastern Michigan Atari users group who has stead fastly refused advances to join the MAM consortium, was sharply condemned for charging "50 cents to $1 admission" to attend a special meeting hosting Atari execs. "I was strongly misquoted by Mr. Rayl," says Sourcerer's Apprentice Editor Mike Lechkun. "I went out of my way to call Bill Rayl long distance to share and report this bit of local Atari news. I was shocked to see it turned into a negative slam against us (MAGIC)."

"I told his wife (and MAM co-editor) Pattie that MAGIC was asking for a donation to help defray costs of starting up another Atari fest effort [as well as to pay for the increase in space needed for the meeting]. It seems to me," commented Mike, "that MAM is allowed to rake in money for it's own ventures, but others trying to serve the Atari community are, in their words, 'tasteless'."

Mike concluded that he'd "be more than happy to make a donation in the Rayls' name if they couldn't cough up a couple of bucks!" It was MAM, over a year ago, who slammed then-non-participating club MACE when they proposed charging non-members to attend the monthly meetings. MACE was (and is) losing money rapidly by providing services to non-members who were sponging off the group. Because of the article, MACE was embarrassed into changing their newly adopted policy.

The members of MAGIC have always felt that a user group's newsletter helps to define and add personality and individuality to the club. The newsletter is the club's identity to the outside world. It is a shame that MAM feels that their viewpoint is the only valid one in Michigan, and that any other club's views are "considered extremely bad taste."

Quote from MAM, 9/88

Atari News and Comment

"In a move that can only be considered extremely bad taste, MAGIC is planning to charge 50 cents or $1 admission to attend this meeting [with Atari's execs]! The meeting takes place on their normally scheduled meeting night, and MAGIC's meetings are generally open to all. But, in this case, MAGIC proposes to charge admission from the very people they are going to need assistance from if another show will occur. MAGIC can't pull off an AtariFest on their own, but if any other clubs want to get involved at this first meeting, they'll have to pay to do so? Hopefully, MAGIC will change the tune before October..."

ATARI KILLS DETROIT VISIT

ATARI CORP.'s proposed visit to Detroit user group MAGIC has been cancelled. Sam Tramiel said that such a visit would "excite group members", but with no product to deliver and because we are right before Comdex, there's really nothing that could be said. ATARI has promised full support for a Detroit AtariFest, which the MAGIC group is still

considering. Sig Hartmann commented that the November Comdex show would be "an opener to a revitalized U.S. market presence", and indicated a proposed resurgance after the first of the year. But as to not discourage those who would attend a large scale meeting from afar, Atari will not make a local apperance until the show.

** NEWS BULLETIN **

Attention all persons that have a program being called "Master Cruncher" or any alterations of that. It seems that a group of pirates have edited out the Copyright notice and have claimed the program as there own. This Utility is not Public Domain nor a Pirate utility, it is a Commercial program that was going to be sold in The Federal Republic of Germany. There were plans to market it in the USA, but due to the massive spreading of the utility, there is no hope of making any kind of profit nor will there be any other such utilities produced due to these problems, it is not cost effective to try and track down who did this terrible thing, so you can just thank who ever the persons involed for screwing up the future of such useful utilities you might have had. Please notify all sysops or board operators that this file should be deleted from file sections and not posted again.

I was really surprised to hear that it was posted on 2 major commercial networks, I would have thought they would have questioned this utility because of no documentation or origin of source. I would have thought the sysops would be a little more responsible to there amiga comunity and check things that are questionable out first.

A final note, the version that seems to have made it's way all over the United States is still a beta version and has a Serious! bug in it, I do not accept any responsiblity for any damage caused by the faulty program. "it is not my fault everyone pirated it" I strongly suggest you uncrunch everything crunched with it or things might begin to happen you wish didn't. You have been warned of the problem. Please spread this file as fast as my program was spread to warn people against the possible destruction of all there data.

NEW BOOK ON COMPUTER VIRUSES
~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~
Compute!'s COMPUTER VIRUSES

Author: Ralph Roberts
Price: $14.95
ISBN: 0-87455-178-1
On Sale: November, 1988

Publisher: Compute! Books, a Capital Cities/ABC Company

Why are the big computer companies keeping quiet about the problem of computer viruses?

``Over one percent, or about a quarter of a million IBM PC's and compatibles are already infected,'' says Larry DiMartin, president of Computer Integrity Corporation, the makers of the commercial viral protection program, Vaccinate.

Finally there's a book that shows why software and hardware manufacturers --in some cases selfishly and intentionally--have their heads in the sand. Finally there's a book that helps you protect your system from computer viruses. A book that answers the questions the industry has been ducking.

Like a biological virus, a computer virus can replicate itself and be spread (through the use of ``Trojan horse'' programs) from system to system. Trade a floppy disk with a friend and you may unwittingly be destroying all the data in your system, whether it's a single person computer or a large, networked system of 20,000 terminals. It's not even enough to have good backup--a timed release virus can also be in the backup disks or tape, destroying data time after frustrating time.

The destructive rampages of these small hidden programs from sick minds are not limited to ``high risk'' users who download indiscriminately from ``pirate'' electronic bulletin boards. AP and UPI reports in recent months have reported that such major institutions as NASA, Lehigh University, Miami (Ohio) University, ARCO Oil, Hebrew University in Israel, and others have had computer virus attacks.

Whether you are a single computer owner or a manager of a large area network, Compute!'s COMPUTER VIRUSES offers relief from the fear and the very real danger of a viral infection in your system.

Topics Covered:

* How your system can become infected (risky practices and how to practice ``safe computing,'' and minimize exposure.
* The history of viruses, including some infamous infections such as the ``Brain'' virus, the ``Sunnyvale Slug,'' the ``Scores,'' and the Macintosh ``Peace'' virus.
* How viruses work and what they can do to your system.
* The kind of programs that can hide viruses.
* How to detect a virus or viruses in your system and erase them.
* Protection from virus infection.
* Reviews and tips on viral protection systems, both commercial and public domain.
* Sections with specific protection information for IBM and compatibles, Macintosh, Apple, Amiga, Atari, and other systems.

Contents:

Your Computer May Be Sick!
History and Famous Viruses
How Viruses Work
Practicing Safe Computing
How The Experts Deal With Viruses

Corporate Initiatives for Data Security
(by Pamela Kane, President of Panda Systems)

The Case of the ``Gerbil'' Virus
(by Raymond M. Glath, President of RG Software Systems)

IBM and Compatibles

LINE NOISE REVISITED
~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~
Ctsy CompuServe Atari SIG

#: 47388 S2/CompuServe & BBSs 27-Dec-86 22:10:29
Sb: #Interlink
Fm: Jeff Rigby/Intersect Sof 74615,323
To: Dave Groves 76703,4223

I have never had the pleasure of taking apart a Courier 2400 but most
modems use the same input transformer (FCC Regulations).

Below is a schematic drawing of the Input transformer circuit:

```
----) || (------
Input from ( || ) output to
phone line ) || ( modem
----( || )-----
||
|| (------> 600 ohm Inpedance matching
|| ) < resistor
|| (------>
```

Transformer

You change the 600 ohm (blue black brown) resistor, to a lower value by
tacking a resistor in parallel. Try values from 1000 ohms to 600 minimum.
This is a quick and dirty method, it works by making the transformer less
efficient and therby reducing the sensitivity of the circuit. The resistor

is there to cause the input transformer to match the phone line (600 ohms) impedance. When you have an impedance match you have maximum transfer of energy. Choose the highest value resistor that gives the fewest errors.

********** UPDATE **********

17-Sep-88 09:21:43
Sb: #110696-2400 baud problem
Fm: INTERSECT Software 76004,1577
To: SYSOP*Dave Groves 76703,4223

The resister will reduce the sensitivity of the modem to incoming noise. If the problem is only periodic and does not get worse after warmup then this is the method to use. If it does get noisy after warmup then open the modem and look for an 8 pin chip with X2444 on it. It's an XR chip that sometimes causes the line noise problem at 2400 baud.

Since 2400 baud does push the Florida phone lines to the limit, neither method may work for you.

~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~
CIRCUIT MAKER by Bill Pike (PAC)
~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~

My field of endeavour, that which I do when not using a computer, involves a lot of logic circuit design. Well anyhow I was going thru the local software store and happened to see a program on the shelf that immediately caught my eye. The name of the program is CircuitMaker and it was written by Ozzie Boeshans. The cost is $69.95, why not make it a even $70?. The program is published by ILLIAD Software.

For those who havn't used this type of program in the past, this includes until now me, this is the cats meow. No more breadboarding of circuits. No more burning out chips. No more tangles of wire, piles of parts, and general mess laying all over the place. Also, for those who are married, no spouse telling you to clean up your mess.

Version 1.2 of the program allows you to design various logic circuits on screen and TEST AND DEBUG THE CIRCUITS ON SCREEN. The program then will print the circuit on your Epson compatible printer. You can also go back to the last saved version of the circuit if you have made a mistake. The next version, 2.0, is said to allow you to specify and make a library of your own favorite IC's. Didn't I say that the program comes with 1 library of various logic gates and IC's? Well if I didn't, it does.

Here is what is in the library: All of the various types of gates including, a inverter, 2-4 input AND & NAND, 2 input ORs, 2 input NORs, and 2 input exclusive ORs, LED's, seven segment displays including the BCD

to 7-Segment decoder, switches, two types of quad latches, 7474, 74138, 74151, 74168, 74169, 74109, and 74194 IC's.

There is a snap-to-grid feature so everything looks neat. The various logic devices can be rotated in 90 degree increments, you can label either vertically or horizontally. When you are wiring the circuit the curser is accompanied, once you move out of the device area, by a set of full screen cross-hairs that show you where the wire will end up both vertically and horizontally if you extend it the full screen. This allows you to be much neater in the layout of wiring. There is also a dot placed where wires join so that you are sure of the connection. You can also move devices around or delete them if you decide that the location is bad. You are working in a window of the design, the window is approximately 15% of the working area. You can wire outside of the screen area.

I find that you should make a printout of just the device placement so you are able to easily find the devices not on screen when you start to wire. A zoom command would have been nice.

There are programmable pulse generators for signal inputs, each generator is independently programmable as to waveform and start time as well as well as when it starts. The speed is variable in common. There is a four input oscilloscope that can be used to check any four points in the circuit simultaneously.. You are able to either use a continous run or set for 5 or 10 cycles. The various wires show you the logic level on that wire by either being solid black (logic 1), dark dotted (logic 0), or light dotted (not active) as the test is running. If you are using a color monitor the colors of the lines change to indicate the same conditions. You are able to move around the screen during the run so you can see the functioning of the entire circuit.

There is a tutorial on fundamental logic circuit design included in the small 50+ page manual. The tutorial doesn't go into much depth and those who are unfamiliar with logic design should pick up a book on the subject as well as a TTL Device handbook so you can figure out just what the various chips are and what they require to work. The program doesn't go into microprocessor logic and if it did it should/would probably cost about 10 times as much, if not more.

This program is designed for the average designer and builder not for someone who does this for a living, he/she would probably have the $700 to $7000 version of this type of program and a main frame to run it on. This is a MUST HAVE program for anyone who designs logic circuits including those in college level logic design courses. It is also a must have for anyone who just does logic design at home for their computer interfaces or anything else, this is most logical (sorry about that it slipped out). So dig into your pocket and BUY THIS ONE.

********** SAM TRAMIEL IN CONFERENCE **********

The Atari Forums on CompuServe will be sponsoring a world-wide electronic teleconference with Sam Tramiel, President and Chief Operating Officer of

Atari Corporation, on Monday, September 26 at 9:00 PM EDT. Your participation in this conference is welcomed and encouraged!

The Sam Tramiel Conference is going to be held in CompuServe's Electronic Convention Center(tm). The Electronic Convention Center(tm) was designed specifically for special conferences of this nature and can have as many as 300 people participating simultaniously without causing the slightest speed decrease. In addition, the Electronic Convention Center(tm) offers the capability of holding a more structured conference, making it possible for you to ask your questions and be answered by Mr. Tramiel without any interruptions. Top performance is absolutely guaranteed! Lastly, the Electronic Convention Center(tm) offers additional conveniences (discussed later in this text) that will make your participation in this conference amazingly easy. If you've participated in other national conferences of this type before and have been underwhelmed at the way it was conducted and the performance of the service during 'heavy' usage, this conference is your opportunity to experience the communication power of a professional -quality global information network.

ACCESSING THE CONVENTION CENTER

As mentioned above, the Sam Tramiel conference will be held in CompuServe's Electronic Convention Center(tm) -- NOT the conference area of the Atari 16-Bit Forum. To access the Convention Center, type GO CONVENTION at any CompuServe command prompt.

When you type GO CONVENTION, CompuServe will display the following menu:

Electronic Convention Center(tm)

INFORMATION/RESERVATIONS
1 Instructions
2 List Conferences/Make Reservations
3 Review/Cancel Reservations
4 Conference Etiquette

Enter choice !

Choice 1 allows you to view the complete instruction guide for using the Convention Center. Choice 2 and Choice 3 allow you to list upcoming special conferences and any advance "reservations" (NOT NECESSARY FOR THIS CONFERENCE!) you might have made. Lastly, choice 4 provides some information on the etiquette followed by participants in an electronic conference.

On Monday, September 26, at 8:30 PM EDT (a half hour before the Sam Tramiel conference is scheduled to begin), the Convention Center menu will appear as shown above with the addition of menu choice 5 which will allow you to enter the Sam Tramiel conference. An example of how the Convention Center menu will appear from 8:30 through the end of the conference on September 26 appears below:

Electronic Convention Center(tm)

INFORMATION/RESERVATIONS
1 Instructions
2 List Conferences/Make Reservations
3 Review/Cancel Reservations
4 Conference Etiquette

JOIN CONFERENCE IN PROGRESS
5 Atari Sam Tramiel Conference

Enter choice !

All you will need to do is select choice 5 in order to join the conference. Once you select choice 5, CompuServe will prompt you to enter your name:

What is your name? John Doe

Enter your name and press a <CR> as shown in the above example.

If you enter the conference area before 9:00 PM EDT, you can chat briefly with other early arrivers until the moderated conference begins.

ASKING A QUESTION

Once the moderated conference begins, only the moderator and guest speaker will be allowed to openly communicate at all times. Other participants must signal that they would like to ask a question or make a comment by using the /QUESTION (or /QUE) command. Once you issue the /QUE command, CompuServe will add your name (in order) to the queue. When it is your turn to speak, CompuServe will beep your terminal and display a message explaining that it is your turn and you may now ask your question. If you attempt to openly communicate before it is your turn to speak, the Convention Center will send you a reminder that in order to ask a question or make a comment, you must enter the /QUE command and wait for your turn.

If you issue the /QUE command and change your mind about asking a question, you can enter the /UNQUE command to remove your place from the queue.

USING THE BUFFER

The Electronic Conference Center(tm) makes it possible for you to compose or upload your question or statement into a buffer area, followed by giving you the option of editing the text using standard CompuServe EDIT commands (explained in detail in EDIT.TXT, available in LIBRARY 1 of the Atari 16-Bit Forum). Then, you can send your pre-composed buffer when it is your turn to speak in the conference. Here are the commands you will need to know in order to use the buffer feature of the Convention Center:

/BUFFER EDIT - Brings you into "edit" mode where you can compose, ASCII-upload, or edit your text.

/BUFFER SEND - Send buffer to all participants.

OTHER COMMANDS YOU SHOULD KNOW ABOUT

The following list of commands are available to you in the Convention Center:

/BUFFER EDIT Edit text buffer
/BUFFER SEND Send text buffer
/BULLETIN Display short bulletin
/COMMANDS Show list of commands
/DAY Show date and time
/DISPLAY Change message display
/ECHO Show input as it is typed
/EXIT Exit the conference
/NOECHO Do not show input
/HELP Command help text
/NAME Change your name
/NOSEND Refuse private "send" messages
/OFF Log-off
/SEND Send a private message
/STATUS User/guest count
/WHO Show last speaker
/USERS List users
/LOOK Question status (how many people are in the queue)
/QUESTION Question request
/UNQUEUE Cancel a question

If you have any questions, please feel free to post a message to the Sysops of the Atari Forums. Otherwise, hope you found this introduction file useful and we're looking forward to seeing you at the big conference!

~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~
8 BIT OWNERS UPDATE
~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~

There have been many mentions in the almost decade since the original Atari 400/800 Personal Computers hit the dealers shelves about there being a future upgrade to meet the user's needs, and new and more challenging applications. Finally that upgrade is available..... The Turbo-816 by DataQue, for the Atari 400/800/XL/XE.

DataQue Software is pleased to announce a powerful new upgrade which was co-designed by Ron Shue, and Chuck Steinman. This upgrade will be available in two forms. There will be a replacement CPU board for the original 400/800 Computer system, and a plug in module for the XL/XE series. In either case, there usually is no need for any modifications to the existing hardware. The only exception to this is with XL/XE systems which have their CPU soldered in place, which will require the removal of the existing CPU, and the addition of a standard 40 pin I.C. socket is suggested. Also included is the Turbo-OS, by DataQue for use with the Turbo-816 CPU boards.

The Turbo-816 will not only increase the potential speed of the computer, but also break the 64k memory barrier of the existing systems. Not with the awkward paged memory, but with a fully linear decoded address space of up to 16 megabytes. Benchmarks have put the Turbo-816 into a performance

range ABOVE many of the 'other" PCs/!! Special memory boards will be available to take advantage of the new extended addressing range. These will be mounted internal to the computer cabinet, and in most cases require no hardware modifications.

And here is the amazing feature..... While adding all this power and all this expanded addressing, the Turbo-816 for the Atari 8-bit computer systems will maintain compatibility with most currently available commercial and user written software. Using the Turbo-816 even those older programs will enjoy a speed increase!

The Turbo-OS is a replacement operating system for use with the Turbo-816 which will release the 16-bit processor to its full power. Increased speed will be the most obvious change, but hidden in its code, will be an advanced new floating point library that will speed even the original Atari BASIC to new levels of performance. Again, on most systems it will be just a matter of replacing the existing ROM(s) with the Turbo-OS.

The future holds many more products for the Turbo-816 systems including:

1) a real-time multi-tasking operating system kernal
2) a new assembler-editor-debugger package which supports the new assembly level instructions and addressing modes
3) a new BASIC which will speed past the fastest of the current BASICs for the 8-bit machines
4) a new K&R compatible C development package
5) a new Turbo-GOS operating system (graphical based)
6) a developers development kit for new applications

The NEW Atari Turbo-816 should be available by November of 1988 For more information contact your local Atari Dealer or, write:

DataQue Software

Subject: Re: Boycott Apple Again -- Now about Suns
To: info-atari16@score.stanford.edu

I think that this discussion has gone quite astray. Suns and Macs are, for 99.5% of the computing world, oranges and apples.

A Macintosh is designed to be a standalone personal computer that will basically run correctly from the moment it is turned on. It is designed around the assumption that the user is not very sophisticated about computing.

Suns are diskless workstations, which can be given local disks to allow them to run in standalone mode. A Sun can only be used easily when there is a sophisticated system manager available who will work out the kinks in issues like swap space, disk partitions, etc.. If you are such a person or are part of an organization that already has such a person, a Sun may be a good choice. There is lots of free software that runs on Suns and is useful. For much of it, though, you may need to run make, extract shell archives, and run dbx from time to time. However, I don't think you can find a $150 WYSIWIG word processor for the Sun that will print on a $500 dot matrix printer.

In my experience, the only time that Suns and Macs become comparable is when you talk about the bottom of Sun's line (3/50 with a 70meg SCSI disk) and the top of Apple's (Mac II with 80Meg disk, A/UX, 5+Meg of RAM).

Network based Sun systems do appear to be more fragile than Macintosh systems (which do not depend on the network for critical resources, like virtual memory). Some of the fault lies with Sun's decision to trade-off reliability for speed and simplicity in the Network File System. But much of the time, any problems arise from the decisions made by the administrators of the local system to spend $5000 on a new

3/50 instead of another 4 Meg of memory for the file server. A Sun is a
good machine if you are a programmer or can afford to hire one. A Mac
is a good machine no matter who you are, but is not as good as a Sun for
computer science research and some other technical pursuits.

Pardon my little harangue,

Ethan Munson

>argc and argv with a GEM program the program bombs.

Although I don't use MWC myself, I will make a few remarks:
1) There is no means that I know of to supply parameters to a Gem
program if it is started from the Desktop.
2) If the program is started from a shell, the shell should be a Gem
program, otherwise the program cannot use Gem functions. I'm not very
sure about this one, though.
3) You don't need to do anything different for a Gem program than for
a Tos-Takes-Parameters one.
4) The bus error is perhaps caused by incorrect treatment of the
argc,argv list, e.g. accessing an element argv[i], with i >= argc,
or argv[0], whose contents is undefined (GEMDOS does not pass the
program's name). I even think there are compilers that put a null
pointer (not an empty string pointer) in argv[0], which is in effect
incorrect - argv[argc] should be the first null pointer of the list.

Leo.

Manually compare the tos and gem runtime startup modules. Sources are
provided with Mark Williams C. You might also try linking directly with tos
startup instead of gem startup. The the only thing you have to remember is
that linking with -VGEM also includes the Gem library. Link with something
like;

ld -s -o output lib/gcrts0.o objectlist -lvdi -laes -lc

That should do it.

> You might start by reading the sun-spots digest - you'll see enough bug
> reports to make your eyes bug out.

Well, I've made my share of postings to Sun-Spots, but I surely
wouldn't want them misinterpreted as advising people against buying
Suns. Reading an unedited list of problems from users is always a
frightening experience. The monthly listing of bug reports from DEC
for TOPS-20 was far scarier than Sun-Spots. (Presumably the same is
true with VMS, but I don't look at those.) Back when I looked at bug
reports published by IBM for MVS, it was amazing what sorts of bugs
there were even in that very reliable system. (They even had this
special mechanism for giving you last-minute information on which of
the patches they published shouldn't be installed because they turned
out to create more problems than they solved.) About all one can say
is that there are lots of users out there trying lots of things and so
they run into lots of problems. Many of them are user confusion, but
there are also plenty of bugs. Sun-Spots is mostly a sign of a large
and active user community doing lots of interesting things.

Subject: Re: Apple Talk and Ethernet
To: info-atari16@score.stanford.edu

! There are a couple (at least) of products out that allow you to
!connect an AppleTalk Network to Ethernet. If you did have an AppleTalk
!compatible port on the ST you could then hook it to Ethernet. Of course
!..... If you want Ethernet it is probably going to be
!cheaper to design something to run off the DMA bus instead of going
!through an AppleTalk to DMA converter.
!
! Dan Moore

*Someone asked about ethernet for the atari ST. We (our group at Delft
*University) are currently inquiring about the German product. It is
*supposed to be used at the University of Aachen. I hope to hear from
*it next week. When I hear something, I will post it.

*Hans Buurman

So close yet so far...

BMB Canada made and sold (2?) "ST-network to-PC" dma boxes
called imaginet but the product is no longer available (I just
called 9/15/88).

There seems to be a German ethernet card but how do you get it?

MAYBE SOMEONE AT ATARI CAN SHED SOME LIGHT ON OBTAINING
NETWORKING FOR THE ST?????

maybe this is the kind of product for the entrepeneur (like
MagicSac?)
speaking of which ....
if you had a Spectre 128 AND a DMA-2-SCSI board could you then

run a MAC ethernet or appletalk?

'-s' does not stand for symbol / no symbol, but for strip. This option
is passed to the loader, and means: strip off the symbol table. The
default in Unix is to have a symbol table in your executable (so the
debuggers are not too bad to work with, although -g is preferred if you
want to use dbx).

> This means that to make executables without symbol tables, one cannot use
>GCC, but has to invoke everything manually. Also, all the executables from
>the GNU package themselves have quite big symbol tables. Removing them would
>save several KB, which might help people suffering from storage/memory
>shortages.

I do not quite understand your problem. Put the -s in your makefile, or
add -s to CFLAGS. Now you can invoke make with no special parameters.
As for removing symbol tables, that's a job for strip(1); no doubt there'll
be an ST version soon (if it isn't already there).

> Anyway, thanks to John for his impressive work !

I fully agree.

Leo.

|
|What is wrong with the following code?
[some lines deleted]...
|#include <stdio.h>
|/* #include <math.h> */
|
|#define MAXVAL 32767
|
|main(argc,argv)
| int argc; char *argv[];
|{
| int i, x;
| extern int atoi();
|
| for (i=1; i+1<=argc; ++i) {
| x = rand();
| printf("%d %d %s %d %d %d\n",
| x, i, argv[i], (double) x / MAXVAL, atoi(argv[i]),
| (double) x / MAXVAL * atoi(argv[i]) + 1);
| }
|
| putchar('\n');
|}
|
|The code compiles, but produces bad (atoi()?) results... why? Why are
|the atoi(argv[i]) values bad (negative)?

The arguments supplied to printf() are not conforming to the format:
(double) x / MAXVAL is of type double (probably 8 bytes on the stack),
while you try to print it as an integer (%d) (2 bytes in mwc ?). So the
first three arguments print correctly, but the last three are taken
wrongly from the stack, and besides are interpreted wrong (as integer,
but they are double,int, double. Using a cast (int)(double expr.) for the
double expressions should solve your problem.

Leo.

I got a copy of MegaMatic off of DELPHI and it is great

optional features at config time

* reset surviving ramdisk up to 2Meg in size
* built in screen saver
* Disk verify on/off
* Print spooler (I never used this)
* key sequences for rebooting (warm/cold)

I have used it extensivly to develop a large project for the Megas
and have not had any problems. I usually use a 1.2Meg one on a Mega4.

The program is copyright Lloyd Pulley 1988 TIF Software.
The version I use is 1.15.

Hope this helps

> printf("%d %d %s %d %d %d\n",
> x, i, argv[i], (double) x / MAXVAL, atoi(argv[i]),
> (double) x / MAXVAL * atoi(argv[i]) + 1);

The way printf picks up arguments is as follows:
%d = Pick up 2 bytes of x (which is an int) = OK
%d = Pick up 2 bytes of i (which is an int) = OK
%s = Pick up a pointer to a string argv[i] = OK
%d = Pick up 2 bytes of the 8 bytes that correspond to the value of the
expressiion "(double) x /MAXVAL".
%d = Pick up the next 2 bytes from the previous double-precision value
%d = Pick up the 4th and 5th bytes of the double-precision value
\n = Start a new line (which ignores the 7th and 8th bytes of the first
double precision result, and ignore the 2 bytes of the atoi value,
and ignore the 8 bytes of the 2nd double-precision floating point value.

The problem is in the use of %d with double. You should be using %f
for double, however you don't need double in this program; use ints and
longs instead.

Subject: Re: ST news software / Sobozon C
To: info-atari16@score.stanford.edu

In the referenced article, Dale Schumacher referred to the GNU redistribution
conditions. He was close, but a bit off. In the gnu.gcc newsgroup RMS stated
that he considers the GNU 'copyleft' (essentially meaning free availability
of all source code) to apply to anything that is a 'derivative work' of
a Free Software Foundation product. That's a technical legal term there, and
right now the best guess is that it means BISON output or anything linked
with the GNU libraries, but not anything simply compiled with gcc and
the associated tools.

1) It was "stolen" from me. I guess it's too late to apply for a trademark, right? :-(

2) Stop wondering what it means. It's a dig against Sun for putting such crappy ethernet tranceiver connectors on their machines, and is a direct parody of their "the network is the computer" slogan. You would think that a company which makes products which depend so much on networking (let's face it, a diskless workstations with a disconnected tranceiver cable is just a very large paperweight) would pay more attention to how they plug into that network.

Subject: Re: argc and argv with gem
To: info-atari16@score.stanford.edu

Jim,

You probably compiled your program specifying the -VGEM or -VAPP
option to the compiler driver cc. For an unknown reason, the GEM runti
runtime startup sets ARGV to NULL. Just take a look at the source, or
at the manual at page 141 (entry crtsg.o).

Solution: call cc first with option "-c", and then call the linker
yourself specifying both the correct runtime startup crts0.o and the
VDI/AES libraries (-laes -lvdi). This will work!!

The sun-spots digest is one of the most useful, informative and entertaining
groups that truly reflects the popularity and commitment of Sun's many
satisfied customers.

The comment on the connector is not a Sun specific complaint, it refers to
a long debate on comp.protocols.tcp-ip, regarding the DB15 ethernet drop
cable attachment as used by *all* ethernet vendors ('cos its in the standard).

Read sun-spots, not these flame wars :-) for the full story.

Subject: Re: Wait a Sec... (was Re: Atari fair at Duesseldorf (West Germ
To: info-atari16@score.stanford.edu

There are a few things which may be missing here. First, last I heard, Atari Corporation are selling ST's of all makes as fast as they can make them - which many businesses would probabaly like to be in.

From a consumer's point of view, the ST is a bargain. It isn't very expensive, and is very sophisticated hardware (It even runs Mac software better than a real Mac - thank you Dave Small!). The programs are priced very competitive (the <$100 word processors blow away most of the things for the Mac and PC I have seen - at least in either price or performance).

The problem is for the *DEVELOPERS*. It isn't that hard to write ST software, and there is a lot of quality PD stuff out. Atari has not been very supportive (I realize that there is a new "push" at Atari, but it has not really materialized for the most part). I don't know how many are working for the European market, put that is apparently where at least half of the ST's are. And here, games seems to be a larger segement of the market than common business programs, much less esoteric utilities.

I don't know what Atari can do about this either - their logo is not one that most purchasers or managers recognize, or if they do, "Isn't that a game machine?" is usually the response. And with the DRAM shortage and such, they couldn't provide them in numbers anyway. I really liked the ad in that desktop publishing magazine, and hope to see more, but it is likely to require more. And part of the problem is to get these larger volume customers who are likely to buy site licenses and a lot more software (at least things other than games).

I would also perhaps appreciate some more recognition on the part of Atari that Software is a part of what sells the machine, and in some cases a large part - and not the software Atari writes. Perhaps Atari should consider aiding some of the developers in Atari's targeted ads by simply mentioning that such software is available from..., which they have done in their MIDI ads. I don't think the ST is dead or dying now, but it has to do something soon since the software supply will dry up otherwise (much as your doctor might tell you to quit smoking or lose weight - you won't die tomorrow, but you won't stay healthy indefinitely while indulging).

[closing stuff deleted]

Hmmm... Assuming the entries in ICDFMT.DAT for your controller and
disk drive are correct and you aren't having any cable problems,
I would guess its the Atari Host Adaptor that's causing you grief.
There's a known problem with the PAL chip on Atari's Host Adaptor
that causes it to respond to all LUNs, even if only one drive is
present as LUN=0. Maybe this problem also interferes with operating
more than 1 drive.

There's a couple of possible remedies you could try. First, you can
buy a replacement PAL chip that's supposed to fix the problems with
the Atari Host Adaptor. One such chip is available for about $20 (US)
from:
Berkeley Microsystems
360 Oakland Avenue, Suite 5
Oakland, CA 94611
(415) 465-6956

Second, you could purchase ICD's Host Adaptor board. This will not
only fix the LUN problem. It also gives you a battery-backup clock,
a DMA Daisy-chain port, and greater immunity to cable noise. The latter
allows you to run a 36" DMA cable to the drive. The ICD Host Adaptor
goes for around $135 (US) and is available from:

ICD
1220 Rock Street
Rockford, Il 61101-1437
voice: (815) 968-2228
modem: (815) 968-2229
fax: (815) 968-6888

Here's my Hard Disk Story:

I had an Atari SH204 20Meg Hard Disk. I needed more disk space and
didn't want to spend another $600 for 20megs. (Not to mention the fact
that the SH204 has no Daisy-chain port.) This is what I ended up with:

(From my SH204)
o Seagate ST225 20Meg Hard Disk
o Adaptec 4000 Controller

(From my local Hard Disk Dealer)
o Seagate ST251 42Meg Hard Disk

(From ICD)
o Host Adaptor Board
o 5 1/4 Hard Disk Case (w/HDA Mounting Kit & Cutout)
o Controller-to-Disk Cable Set
o 36" DMA Cable

Using the ICD format software, I'm able to get 22.2 Meg from the ST255
and 44.4 Meg from the ST251, for a total of 66.6 Meg of Hard Disk.
Total cost was about $650 (US), about the price of another SH204.
I've been using this setup for around 4 months without a hitch. I also
feel much more comfortable using the ICD HD software with it's
read-after-write verify. The only problems I had were with the Hard Drive
Case. Some of the drive bracket mounting holes were miss-aligned and had
to be re-drilled, the hardware-kit (screws,etc) didn't have the right
hardware, and space is _real_ tight inside the case. Nothing a drill and
a trip to the hardware store wouldn't solve. Also, saving the leftover
SH204 parts gives me a head-start on my next storage increase. By just
adding an RLL controller, a 96Mb drive, and replacing the PAL chip on the
Atari Host Adaptor board, I'll have more storage than I'll possibly need.
:-) :-)

Hope this helps,

Ric Clayton

Just don't use the GEM switch on your link line. For some
unknown reason Mark Williams uses a different startup routine when you
say you have a GEM program. If you don't use the GEM switch you get the

standard startup routine which lets the program accept command line
arguments when you launch from a command shell.

>much higher) but, of course, 2400 baud cuts your download time in half.
>I would recommend using 1200 baud for interactive online time; log out
>and call up again at 2400 baud just for downloads.

I have learned from painful experience that on Genie and CIS and other systems
that 2400 baud is not necessary twice the speed of 1200 baud. The bits pass
thru the modem at 2400 baud, and you are paying a higher rate; however, there
are more pauses and longer pauses at 2400 baud. If you take two people
downloading under similar conditions and load on the network, but one is
downloading at 1200 baud and the other 2400 baud, it may turn out that the
2400 baud person takes less time than the 1200 baud person, but not close to
half the time. Under heavy conditions both of them may take the same amount of
time. Genie is better than CIS in this regard -- Genie sends the entire file
to the local node that the user is downloading from quickly, and the local node
handles the download. CIS sends the file in packets across the entire network
which slows the download down considerably.

Subject: Re: This "Dying ST" nonsense
To: info-atari16@score.stanford.edu

I was just watching a movie during prime time here in Canada and saw
a commercial for the Atari 520 ST. The ad claimed that the 520 is twice
as powerful as most business macnines and had great graphics and games.
The ad was very well do although they did seem to want to cram a lot
into a 30 second spot. Now why would a company that a lot of people claim
is dying all of a sudden spend lots of money producing spiffy ads, it just

doesn't make sense.

Just thought I would throw my 2 cents worth in.

The media change bug has to do with the type of disk drive used.I ran
into this problem when upgrading my 520stfm to double-sided drives.I
had problems (media change)with a Panasonic JU-364 ,but not with a
Mitsibishi model MF 353B-88UF.
I'm not certain ,but I think it has something to do with the way the
write protect tab is detected.(optical or mechanical)
Maybe someone else can clairify this a little better for us.

I wasn't going to respond to this figuring that there would be a
huge response from Sun users, but since it wasn't posted to the sun newsgroup
I'll put in my $.02 worth.

I've had a Sun on my desk for 4 years now, and my department has
about a dozen. Schools by us have Sun's by the 100's. Compared to other
machines, Sun's software is top notch and we frequently use the sun's to
monitor our networks. I really think that Howard's opinions are in the
minority viewpoint. So much so in fact, that it would be interesting to
find out what he *would* recommend to his worst enemies as an alternative.

> *none* of the bugs have your name on them. Do you work for Kirk Smith?

I do not work with Kirk Smith, and these opinions are my own, and I make
no claims about or related to my employer. Take this in a personal
respect as I am sure we will be contacting Sun in an official manner on
these items and some others.

First, I did *not* mention bugs, although I could have, so you checking
a bugs database is kinda dumb. My *real* complaint is the state
that you send your distribution out in. I have hit three major problems:

1) Some sources are missing completely.

2) Some binaries don't match the sources, and we can't recreate the
binary without loosing functionality

3) Some of the sources even had syntax errors in them

Some other points, good and bad:
o The dyamic libraries are neat, although I have seen them before. (but
sun never did claim they invented them).
o The modifications to make can get pretty annoying.
o The system is also one big security headache, although that is true
of any workstation.
0 You guys were a little haphazard in moving some sources and not others.

I have a color Sun 3 in my office and it is just unacceptably slow.
Especially if you want to use X11R2, but it carries on to Sunview
also. It can get so that scrolling is no better than 1200 baud dial
up. HP's color workstation is about 100 times faster, although they
have thier own problems with networking.

Maybe I was a little harsh to say "my worst enemy". Everyone talks
so highly of Suns equipment that I was really disappointed when i
sat down and worked with one. If you are going to buy a Unix box,
shop around. Maybe Sun is *your* best buy. It is all a matter of
context: what are you getting it for?

I hope that future releases continue to improve, and I would much
rather deal with Sun than Apple (or even Dec).

Again, I am stating what I think, not nessasarily how Purdue feels.

I would love to see some info on the Atari Ethernet. Does anyone know
anything about it? Also, I have TeX for the ST. Someone just ported it
and sent it to our intermediate archive. FTP to clio.math.lsa.umich.edu

(35.195.16.4) and sign on as id ftp with any password. [If you were
using euterpe, switch to clio, you'll get a better connection] We're
still setting up our real archives on the 3090, but until then grab it
off there. Feel free to send something back to us :-), especially suff
that you ported and want to have distributed. Send sources too, we have
next to unlimited disk space.

To: info-atari16@score.stanford.edu

| I have the media change bug on my Mega 2. (The escape key does not always
| update the drive A directory when write protection is enabled).
|
| My Mega 2 is still under warranty. I am having trouble getting it repaired.
| Although my dealer was not aware of the problem, he replaced by drive.
| However, I still have the problem.
| Who can my dealer talk to at Atari to get information on the media change
| bug? My dealer claims he talked to Atari without success. . Although my
| dealer is an authorized Atari dealer, he is not a knowledgeable dealer.
|
| What is the fix for the media change bug? I thought replacing the drive
| would fix the media change bug.
|
| Gregory Gibson
| gibson@trwrb.UUCP

I've seen this on my ST2 as well. It always goes away when I close the disk
and re-open it. I've only seen it twice but both times I had a RAM disk
open. Both times my floppy was NOT write protected.

%%%

As the new owner of an ST2, I'd like to add my two cents about this "dying computer" hoopla.

While shopping around for my computer, many dealers told me whatever they could to discourage me from Atari and get me into an Amiga:

"Atari ST computers are hard to get and we can't keep them in stock. They're backordered and who knows when they'll come in."

"There isn't any profit margin in Atari computers since Atari shut out the discount mail-order activity."

"We don't discount our Atari computers, except for demos, because they're hot sellers and we don't need to."

"Most people are opting for Amigas these days because the Atari is pretty much of a dead end. Look at our software shelves - 90% Amiga and less Atari stuff everyday. No one is buying the Atari stuff."

I ended up buying my Atari from a local music store, from stock, at a discount, and they got me all the software I wanted within a week, again at a discount (music stores don't sell lots of compilers!). The discounts rivaled those mail-order outfits that the other dealers seem to think are out of business.

I can only speculate as to why these dealers are verbalizing these conflicting packs of lies. Somehow they must figure that they can make more money by doing it. Maybe they're overstocked on Amigas? ;-)

Disclaimer: The author has no pecuniary interest in any of the companies mentioned. The opinions expressed herein are solely those of the author.

%%%

scheme. Under the GNU terms don't you have to make any programs COMPILED the GNU C and/or LINKED with the GNU library available under the GNU terms? Sorry I got sidetracked, anyway, at least one of the authors is on usenet, so I'll let them, Tony Andrews, Johann Ruegg, or Joe Treat, tell you more about Sobozon C. In a message Tony left on my BBS, he mentioned that there were some compiler benchmarks in this months STart magazine and Sobozon compared quite well against the commercial compilers, rating better than all the compilers listed in two catagories, one of which was I/O. That makes me happy, since they are using extended dLibs for the runtime libraries, and thus the dLibs I/O routines are apparently pretty fast.

The mail order company E. Arthur Brown Company offers European software. I have never seen what they offer, or ordered something from them, so I cannot tell you if they are trustworthy, but I remember someone on the net reccommeding them for mouse/ball controllers.

Their address is: 3404 Pawnee Drive, Alexandria, MN 56308 If you want to place an order over the phone, their number is: 1-800-322-4405 If you want information their number is: (612)762-8847.

I suggest that you write them a letter telling them what you want, and if they have it, I'm sure they'll send you information.

They also carry a line of PD software for the ST and some software for the Amiga.

Remember, I have never ordered from them, so I don't know how reliable they are.

Hmm. I use a Sun 2/120 with x11r2 and it's not "unacceptably slow"
for most things. If you put xterm into "jump" mode you get good speed
on the scrolling. Of course you can't read it then but most people
can't follow stuff running out at more than 4800 baud anyway; that's
why "more" is there.

On a Sun 3/50 x11r2 performance is much better, although still slow
for really intensive graphics applications. This is mostly due to the
lack of a good x11 server for the sun. A quote from the documentation
of the Sun server:

"The drivers are completely untuned and have inferior performance."

If someone got on the ball and tuned the server you'd see much better
performance, especially on the color systems (like yours) where the
server is *really* untuned. I maintain that it's good enough to get
work done on, though. If you want real performance I suggest using a
Sun 3/50 (or better a Sun 4/110) as a smart graphics terminal to
something like an Encore. Yanking all the non-graphics stuff off the
Sun and putting it on a scream machine gives very nice performance and
is fairly transparent under x11; even my Sun 2 runs nicely when I
offload the application to a Silicon Graphics 4D.

It's true that Sun's are sometimes plagued with hardware problems, but
my experiences with their support were all favorable. In addition
they understand that not all users are stupid and allow them to do
board swapping and the like, something that I appreciate. I haven't
any experience with their newer machines (we have 2 Roadrunners and a
few Sun 4's coming, but nothing yet) so I can't comment on increasing
or decreasing reliability. So far I've had one mono card blow up on
me, a disk problem, and a couple of mono screens have flipped out, but
Sun dealt with them quickly so I've no complaints. I have no
idea just how long my Sun 2 has been around, but considering that it's
a Sun 2 I'd say that it's been awhile.

As for their software, it's a good and bad thing. I *like* SunOS, at least 3.5. Some of the networking stuff -- like the yp server -- is pretty hairy and not so reliable, but if you don't have a big network you don't need it and it runs very cleanly. NFS setup is simple and very easily maintained. Security is a problem but it ALWAYS is when the user has direct access to the hardware, not one manufacturer can say otherwise. It still takes a little ingenuity to really screw things up, to Sun's credit, and putting a password on single-user boots really blocks up some holes that exist in 3.5.

In summary I don't think you've voiced a valid complaint. There is virtually nothing else that works as well as Sun workstations in their price range. 386 PC's don't have anywhere near the networking support that Sun's do, almost never have good support, and cost nearly as much. Higher-end workstations (eg Silicon Graphics) often address these problems but they're for a more specific audience and cost a lot more.

Yes, AmigaDOS has less bugs than SunOS 4.0 indeed. And new Sun releases come out about as quickly as Amiga software releases anyways - and the most well known bugs don't get fixed.

Sun's right hand seems to have a problem with chopping of it's left hand as far as I hear - somewhat alongs what C-A did awhile back..

Subject: unpacking split postings to sources, etc.
To: info-atari16@score.stanford.edu

i would appreciate learning about any tools which others might have
accumulated for unpacking split file postings to the net.
in particular, programs to run on both the host unix system and also
programs to run on the atari to automatically "shuck off" the mail
headers, etc. automatically.
also, does anybody have a shell archive de-archiver which will run on
the ST? thanks.

Subject: Strange '-s' flag behavior in the GNU linker ?
To: VBRANDT%DBNUAMA1.BITNET@CUNYVM.CUNY.EDU, info-atari16@SCORE.STANFORD.EDU
In-Reply-To: The message from VBRANDT%DBNUAMA1.BITNET@CUNYVM.CUNY.EDU

From: VBRANDT%DBNUAMA1.BITNET@CUNYVM.CUNY.EDU

I have found what is not quite a bug, but a somewhat annoying feature in the
GNU C linker. It seems that the '-s' flag does exactly the opposite of what I
think it should do. If you don't specify '-s', the linker appends a symbol
table to the executable, if you do specify it, no symbol table is produced.

Well, I admit it's somewhat counter-intuitive, but the semantics of -s
is unchanged from what it was in the unhacked LD.C. Ie, the default
behaviour really is supposed to be to produce a symbol table. After
thinking about it, though, it seems reasonable to change it in the ST
version, as the ST format symbol tables are never useful.

This means that to make executables without symbol tables, one cannot use
GCC, but has to invoke everything manually.

That's not true. GCC passes the -s flag along if it's specified. (At
least it's supposed to; did I introduce a bug at the last minute?)

Also, all the executables from
the GNU package themselves have quite big symbol tables. Removing them would
save several KB, which might help people suffering from storage/memory
shortages.

Indeed. I'm pretty sure I built all the executables with -s (to GCC),
so if they've really got symbol tables, perhaps I did leave a bug in
there. I'll investigate tonight and post the results.

Anyway, thanks to John for his impressive work !

You're very welcome.

> Setscreen((char *) -1L, (char *) new_phys_base, -1);
> Vsync();

I'm not particularly familiar with the ST, but since SetScreen is asynchronous,
the following code (based on Amiga code) should work better:

Generate animation in newscreen;
Vsync(); /* wait for previous SetScreen (of oldscreen) to work */
SetScreen(newscreen);
Go back to generate next screen.

This way you get to do computations while waiting for SetScreen, and there's
always a screen out there waiting to show up.

jeff@stormy.atmos.washington.edu (Jeff Bowden) writes:
>I grabbed the gcc executables a few days ago. I found that I had
>insufficient resources to run it (sob :-( ).

Gcc can be run on a 1 MB machine! You will not be able to compile any larger
files from GULAM, but you can revert to compiling from the Desktop if memory
is a problem.

To bootstrap you NEED:
a copy of gulam

a diskeditor

1) patch the executable of gcc-cc1.ttp so that only 300 kB of stack instead
of 500 kB are allocated (you can search for the value 500000, it only
occurs once, somewhere around 364kB).

Yah, that's described in the blurb. In fact, 300000 is still far more
than you need; in my experience, 128K is plenty for most things. The
thing that really eats stack is compiling large hairy functions is -O;
the 500000 value is for compiling the instruction-cracking routing in
GAS. If you can live without -O, 64K or maybe even 32K will be enough.

[That you have to do this is really
a bug, there is NO need for a GEMDOS only program, that doesn't exec
another program to give memory back to GEMDOS, I'm changing my crt0
so that it will take -1L in _stksize to mean: "Don't do a Mshrink"]

Careful; memory that is malloc'ed comes from ABOVE the stack, not below
it, so you really do want to keep the stack at the smallest value that
works for you.

2) Now throw all resident stuff out (accessories etc. just keep GEMBOOT
or folderxxx (you do have a HD?)), start gulam and setup the enviroment
as described by jrd. You should now be able to compile most programs
(you can compile all of flex except parse.c and scan.c for an example).
This is a good time to get the sources and extract the documentation
from them, how else are you going to know about -mshort
-fomit-frame-pointer etc.?

Right. If there's sufficient demand, I'll package up the docs
separately; or someone else with more time could do so... hint hint...

3) If a source file is too large to be compiled from GULAM, you will get
a "no more virtual memory" message or someting like that (probably
already from gcc-cpp).

typically from gcc-cc1, actually...

You can workaround this by running the
compiler from the desktop, the current gcc.ttp will NOT work from the
desktop (reasons follow), so you will have to write a small wrapper
program to do this (I'm fixing gcc.ttp right now.....).

Note:
all gcc stuff assumes:
file-handle
0 = stdin
1 = stdout
2 = stderr
since the GEMDOS default for handle 2 is the serial
port, this isn't much good when you start stuff from
the desktop.

Yah, I've since realized that 2 is the serial port (!). If you fix
std-init, would you post the fixed version? Also, does anyone out there
have a description of what file numbers 'default' to what?

So you need a
Fforce(2,Fdup(1))
At the begining of your program to see any error output
(and due to a bug in stdio to see any output at all).

Trying this shows two bugs in the current runtime library:

- Fforce has a wrong binding in osbind.h,
it uses 3 short (aka 16 bit) arguments!
Write a trap-1www function to do this.
[BTW is anybody working on cleaning up
the library, there is a lot of stuff that
should be done]

No kidding. As I said in the doc, the library is pretty ragged. I'm
working on getting rid of the trap_foo functions, and generating the
traps in line; perhaps it makes sense to post a recompiled library whe
that happens?
[...]

Don't get put off by this description, GNC CC is worth it!

Glad you like it.

Subject: SHADOW / BDT decline in sales
To: info-atari16@score.stanford.edu

I've found 2 instances in which SHADOW always crashes.

i) Use GULAM's rx to receive some files. THen invoke SHADOW at some point later. Two bombs (i think).

ii) Use UW.prg. Then invoke SHADOW while in UW.prg or at some point later. Same two bombs.

And doing a warm-boot will not revive SHADOW. It will still crash until a cold boot is done. Has anyone else been hit by this? I'm using version 1.01 with a monchrome and a 20Meg Supra.

I've used BDT Micro-Cshell and AnsiTerm. Both are good programs. However, there're quite a few public domain programs out now which are equally good (if not better) when compared to SOME of BDT's programs. GULAM and Uniterm comes to mind. I think this might be one reason why sales for BDT has declined.

>
> < dave stampf

I think we've seen more than enough of this topic, so I'll try to keep this short. First of all, I'm sure many schools have Suns by the 100's. I'm sure they're also often wondering if they'd made a mistake. I've heard many times how Michigan State University fared, with amazing ethernet broadcast storms and meltdowns rendering their campus-wide broadband completely unusable. We all remember the stories of Sun 3/50's ARP requests getting shunted along cross-country by ethernet bridges, yes? In any case, (consider this a challenge if you wish, I know you will not be able to meet it) you cannot put anywhere near 100 Suns on a single network, and get any useful service out of them. The network would simply collapse under too many collisions. I don't believe you will find any place running more than 40 machines on a single network.

Contrast this with, say, an Apollo network. Our engineering school runs over 300 Apollos on a single Apollo token ring, on two campuses spanning over two miles. There's no such thing as a network meltdown there. Diskless nodes don't have to have disk space pre-allocated on servers, and don't eat up bandwidth trying to find their own internet addresses. There's no need for special partitioning of a drive, no particular use for the mount command except for use with NFS. No need to dedicate any piece of disk to swap space - all disk use is dynamically allocated. All disks on a net are always accessible, quickly and transparently. They have a bunch of Suns now too, but they can't compare in performance to the Apollos. Using NFS, all 300+ Apollo disks are accessible thru a single mount point on a Sun. In contrast, it's an amazing hassle to keep fstab's up-to-date to keep all the necessary Sun disks accessible.

It would be nearly impossible to run a bunch of Suns as a well-coordinated network without Sun's Yellow Page service. All well and good, as long as it works, which is, unfortunately, not All the time. A Sun workstation just isn't configured to work in a network - load it up off the distribution tapes and it wants to think it's a standalone mini, like a big Vax or something. Its own password file, hell, its own copy of /etc. You know how silly it is to have 25 copies of /etc/termcap or /etc/hosts online? I couldn't even keep a full hosts file in the yp database because it was so huge it would timeout during ypxfr updates. When 1 of the 4 ypservers went down, the silly machines were unable to locate any of the 3 other running servers, and the whole network was unusable. YP is supposed to be fault tolerant, and is billed as a dynamically load balanced system, but in practice it is as inflexible and fragile as a piece of thin glass. It was also quite disconcerting, when I went looking for possible ways to improve the code, to note that my sources and binaries were not the same version, even though they had identical SCCS IDs. (Different date stamps, different object files.) And I'm one of the fortunate few to have access to full Sun source code.

Contrast again with an Apollo network - these machines were obviously designed from the start to operate in a distributed computing environment. Sun's network support seems to be more of a hastily added asfterthought in comparison. The password database, for example is dynamically updated among what they call replicated databases. It's the same idea on the surface as yp - a few key nodes playing host to some servers. The implementation is much smoother though. For the password database, or "registry," there is also a locally cached registry, which maintains a selectable history size of local users, so even if the main registry becomes inaccessible due to a network failure, the node can be logged into for use. Apollo's network management software is easily the most sophisticated and mature as any I've seen. And with their filesystem, you won't find your NFS partitions temporarily evaporating, you won't be denied access to files that you own, etc. (This is certainly an odd problem to appear in a "stateless" filesystem, but Sun NFS often gets confused and will deny Joe User access to NFS mounted files that Joe owns. Usually fixed by a couple sync commands, so it's only a minor inconvenience at worst, but nonetheless it's a telling sign.)

So much for keeping it short. I didn't even get to talking about how much faster Apollos are, how much more responsive the Apollo Display Manager is than any Sun windowing system, how much more sophisticated the filesystem is, or a lot of other points. Or Apollo's Network Computing System, with which I can writea huge resource intensive application that will utilize all available CPUs and disks on the network. (250 68020's can solve a lot of problems in one helluvausmall amount of time!) So much for that. I have no vested interest in either Suns or Apollos, I use them both all the time. Obviously I prefer the Apollos, even though I'm maintaining 25 Suns here in Math. It's truly amazing how many people I've encountered have only heard good things about Suns, and never bad. Sure, they have their good points, but there's a lot of bad to be aware of, and, more importantly, there are good alternatives to be aware of.

Subject: Change your titles often!
To: info-atari16@score.stanford.edu

People ought to change the message titles for their posts more often.
If you are continuing a discussion on the same subject, allow your
titles to evolve with the discussion so everybody can scan the titles
and see what the messages are actually about. It seems I've been
seeing "Another great quote from Mr. Good" and "To fix or not to fix"
appearing above a large percentage of posts here, and those aren't the
only ones that are recycled again and again. I'm not bitching, but I
think we would all be well served if everyone made their titles a bit
more original and unique. After all, a title should reflect closely the subject matter of
an article.

I realize you may want someone to recognize the post as a reply to a
previously posted article, so maybe you could put a number at the
end of the title, or modify the wording. (some use "(was: .....)", but
even THOSE are getting recycled, so there ya go.)

This post comes to you as a result of my having to read alot of
articles that don't interest me---due to poor titles. C'mon, it's
not that difficult to come up with original titles, just condense
what you are posting about down to about half a line.

PLEASE don't flood this area with replies to this message. If you
feel an uncontrollable urge to use your flame thrower, E-mail it to me.

Thank you for your time.

Rob

As a result of this "phantom drive" phenomenon, you can't install ram
disks since all the drive letters are spuriously taken. For this reason
I wrote a little program that goes in the AUTO folder (after your hard

disk driver) that reads a file to determine what YOU want the active drive mask set to. Thus, you set the active drives before running the ram disk program which can then install itself correctly. The only trouble with this scheme is that I have trouble with reset-surviving ram disks, though I am not sure why. Does a warm reset leave the drive bits alone, including the surviving ram disk? If that is the case, all I need to add is a check to see if the program is being run after a cold or a warm reset. The way I currently use it is to set the drive bits every time and use a non-surviving ram disk, so I haven't been motivated to fix it up any more. If there is an interest in the program (which can either be run from desktop, shell, or auto folder, and uses command-line arguments or a file if no arguments are found to LIST current active drives, SET the desired active drives, CLEAR the undesired active drives, print a MESSAGE, and HOLD the resulting printout until a key is pressed) I can post it to the sources and binary lists. If someone can make suggestions on how to deal better with reset-surviving ram disks, I will incorporate those changes first.

Suggestions welcome.
Thanks,
Doug Monk (bro@rice.edu)

From: nunki.usc.edu!rjung@oberon.usc.edu (Robert allen Jung)
Subject: Glendale Atari Faire v.3 report(!)
To: info-atari16@score.stanford.edu

Well, it's now Sunday, 9/18/88, and the Glendale Atari Faire v.3 is over.
Here's a report, for those who are interested.
(If you're not interested, I suggest you hit "n" now:)

The Glendale Faire may have been a local event, but there were a few things that net.people would be interested in:

* SPECTRE 128. It's _here_. NOW. David Small brought 200 copies out to Glendale, and were they selling! The price is around $180 -- Make your checks out to "Gadgest By Small". David (a very funny and fun guy) was accompanied by his wife Sandy, his infant son, and a few friends.
And yes, I did see Hypercard running on an ST with my own eyes. David also gave a humorous talk on the development of the Spectre, and denies any plans to do an Amiga emulator for the ST or a Mac emulator on the Amiga.

* 8-bit GEM. You want to revitalize your 8-bit Atari? Then take your picks:

Obviously, the biggest expectation in the 8-bit community is GOE (Graphics Operating Enviroment). Yes, it was at the Faire, and yes, Total Control Systems is selling them. They're not _shipping_ until October, but you can order it now and get a discount. It looks like a TOTAL clone of the ST's GEM (You can even hook up an ST mouse and run GOE through it), and ran solid for the entire show. The author says it will run 95% of all 8-bit programs. It comes on a ICD "piggyback"

cartridge, and takes up only 8K of RAM. There's supposed to be a library of GOE routes, so other developers can easily make GOE calls and write GOE products. Looks really terrific.

From the makers of _Celebrity Cookbook_ comes DIAMOND OS (aka ST jr, depending on what time of the day you were at the booth). For $30, it's a graphics interface that offers drop-down menus, windows, and other good stuff (it doesn't _look_ like GEM, however). Reeve Software is promising to release DIAMOND Paint, Write, Publish, and Programmer's Kits, for $30 each as well. It looks like it's disk based (I can't be sure), but that's okay -- it can support up to 16 megabytes(!) of RAM.

* Genlock for the ST was demonstrated, in an open-board "final" version. JRI says they're only waiting for the FCC, and then they'll ship. It's very impressive -- An ST Cyberpain animation was being superimposed over a music video, and the Genlocked result was being shown on both a standard TV _and_ the SC1224 (how do they do that?). Ready to tackle the Amiga?

* Neocept, makers of FONTZ! and WORDUP (a great word processor -- an unsolicited endorsement) were present. Nothing major was presented, although the new version of WordUp, with numerous minor bug fixes, is expected to ship in two weeks. Registered owners will recieve a card in the mail about the upgrade procedure. Neocept also says they'll gladly take user input for improvements for their products -- Just drop them a line.

* Animation buffs like myself will be happy to hear that FILM DIRECTOR is finally being released. Epyx has gotten the rights to this two-year-old cel-based animation program, and it has been SUBSTANTIALLY improved (16 screens for cels, runs in 512K, better user interface, etc.). It should be out in October, and the $50 price tag gets you both FILM DIRECTOR and ART DIRECTOR -- A bargain! Maurice Molyneaux (a fun guy to chat with, a real professional artist) had a lot of input into the final user interface, and it shows. I can't wait.

* Megamax was also showing their soon-to-be-released Laser DB. It's a source level debugger for Laser C, and offers lots of features -- Source-code trace viewing, register value displays, breakpoints, multiple windows. If you liked Laser C, you'll want this.

* Codehead software was also demonstrating G+PLUS (I won't say anything about this, everybody and his cousin knows about it by now) and a new product called MULTIDESK. MDesk allows you to have 16 accessories of your choice in ONE menu slot. Even better, you can clear out and load NEW accessories at any time! You can also change the name MultiDesk registers itself on the menu, so you can have six copies of Multidesk -- each one with 16 different accessories -- for a mind-numbing total of 96 accessories avaliable simultaneously. Future products promised include FatBack ("A unique hard disk backup system") and CodeHead Utilities (A collection of programs and accessories).

* ICD was present and selling their cartridge-based SPARTADOS X. My friend bought a copy ($80, on a piggyback cartridge), and it appears to work just fine. Improvements include 1000+ files per directory, faster disk access, and built-in ARC/ALFCRUNCH support. The manual is still a preliminary copy, however, but ICD promises to send out the finals to registed owners when they become available. They also showed their FA-ST hard drive, available for 8-bit or ST hookup.

* Regent Software was selling copies of REGENT WORD II for the jaw-dropping price of $15 each -- Not $15 off, $15 EACH.

* Broderbund, surprisingly, was present. They were showing their new _Typhoon Thompson_ game for the ST (known on the Apple // as _Airheart_), as well as _Star Wars_ (imported from Europe; Broderbund is distributing). A version of _Karateka_ for the ST is promised, and "maybe" _Print Shop_, but little else. (The dealer was frank in why there was less Atari support -- "Our biggest market is the //gs"). No word on 8-bit support.

* And now, the word from Atari. Conspicuous by their absence, none of the Tramiel family showed up. Instead, we were treated to Sig Hartman, who promised us that "[1989] will be a critical point for Atari in the US market". He also apologized for the lack of more ST's in America ("We had a limited number of Ataris, and we decided to put them in West Germany -- If we didn't, there would have been a hole for the Amiga or the Macintosh to get in"), and pledged closed attention to the end users, through user groups and public information services. Sig refused to "officially" confirm/deny the existence of the Atari Transputer, the 68020/68030 workstation/machines, or anything else -- except by saying "We're working on 7 or 8 products right now, and I can't say what they are." He did promise that 520/1040 owners will be able to get TOS and blitter upgrades, and that he will personally try to get more companies to produce 8-bit titles.

In a related vein, Federated promised the increased development of "compu-centers" in all their stores, and the possibility of offering in-store servicing for Atari products. They are also supposedly toying with the idea of carrying hardware accessories (boards, wiring, etc.) in the centers.

* Pledged to appear -- but never did -- were Data Pacific and Antic. Dealers who did appear, but didn't produce anything major, included Astra systems, Michtron, Migraph, and Seymour-Radix. Bill Skurski Enterprises was present, peddling copies of his "New User's Guide to the Atari ST" (book and videotape), as well as Best Electronics, Logical Choice for Computing, Mid-Cities Comp/Soft, and Comsoft.

Special thanks to John King Tarpinian, the local user groups, ACENET, and everybody else for makign the whole thing possible.

--R.J.

A SPECTRE COMES BACK TO HAUNT APPLE
Gadgets by Small was showing Release 1.0 (?) of Spectre 128 at the "Southern
California Atari Computer Faire, Version 3.0". It is now selling.
Dave Small has outdone himself again, coming out with a superior product in
an incredibly short amount of time.

What warrants the word 'superior'? In addition to the things you might
expect, like being 20% faster than the hardware it emulates, having a
larger screen with a mono monitor, being compatible with SC1224 monitors,
Translator 1, all Mack System and Finder versions, HFS, and the 128K (not to
mention the 64K) ROMS, Dave's Cartridge now refreshes the screen 400% faster
and writes to floppies 800% faster than the Sac. In addition, you can use
Apple's own SCSI HD's with it if you want. Admittedly not a godsend to most
ST owners (who would balk at Apple's prices, for one thing), but most
probably useful for current Mack users who already have the HD, either at
home or at work.

Where the Spectre really shocked me, though, was when I heard about its HD
transfer speed, which, according to Dave's modest figures, is fully 2.5 times
faster than the Mack itself. Much to the delight of the crowd at the seminar,
and as you could imagine, Dave commented that Apple's ghostbusting lawyers are
furious. I think the decision to release the Spectre now at this
comparatively small Faire (as opposed to say, Comdex in the Fall) was a good

way to keep the lawyers from showing up to harass him. Dave is betting that word of mouth and the networks are going to spread the news of this development further and faster than trade publicity anyway.

I almost forgot: yes, it runs hypercard (with a mere meg, even)...and pagemaker, and adobe illustrator, and...well, in Dave's own words, it is "...far more compatible" than the last mack emulator to appear on the market. Of my own first-hand experience with the setup there, its speed and its (larger screen) appearance made it subjectively very reminiscent of the feel of a monochrome Mack II.

There is a downside to everything, hard to find to be sure, but still there. Dave said that version 1.0 has a minor bug in it, but he noted that updates that contain bug fixes will be free (as usual, right?), and that update charges in the future will be smaller than what Data Pacific levied. The initial cost for the Spectre, however, will be more expensive. It is currently listing at $179.95. But my guess is that this compares favorably with Apple's charge to 'enhance' a 512K mack.

One thing that bugged me is that I didn't see anywhere a list of the software that doesn't run (the list of software that DOES run would probably be too obnoxiously big). But surely something must break? According to Dave, he said he actually finished Spectre "last Tuesday," so just maybe they haven't had the time to compile a long impressive list suitable for printing.

A couple other things: still no support for Mack sound or MIDI. Dave said that he's working on getting the sound to work, but that at present enabling it uses up too much CPU and eventually crashes the machine (funny, I thought that the former was true of the real Mack). As for MIDI, I forgot exactly what reason he gave, but the bottom line is "no go".

Since some of you probably would have asked, here is the address that was given for ordering purposes:

Subject: News from Southern California Atari Faire
To: info-atari16@score.stanford.edu

Report from the "Southern California Atari Computer Faire, Version 3.0"
(a.k.a. The Glendale Atarifest):

The biggest news at this show was the introduction of Spectre 128.
Check out a separate posting for info on this.

CodeHead Software was showing G+plus, a "totally compatible" GDOS replacement program, that is faster and has the added capability of reloading fonts and device drivers without rebooting. I never got to see it in action, so I couldn't verify the above statements. They were also showing MultiDesk, a program that can load up to 96 desk accessories, at any time without rebooting to load and 'unload' them. It takes up one regular acc slot. In addition, it allows the use of some sort of macro files to load in a predetermined group of up to 16 accs. at once, with few mouse clicks. They are also the authors of TopDown, the program that cuts bootup time by putting auto programs and accs at the top of memory. Their address is P.O. Box 4336, N. Hollywood, CA 91607

JRI was showing a Genlock System for the Mega ST. They had a cute animation program running on top of video from a VCR. They showed the animation program by itself in one ST monitor and the combined output in both a TV and another ST monitor. The genlocking is fully hardware based, so that no supporting software is needed (i.e. choose from whatever paint program or animation package already available), it has a lot of features I won't mention here. They are tentatively pricing the card at $500. They are currently awaiting FCC certification, and are planning similar device(s) for the low-end ST's.

Neocept was showing the WordUp wordprocessor there. As has been noted elsewhere, it was enjoying a good deal of popularity at the show, more so than the WordPerfect booth. Text routing is very sophisticated, very natural to use, and reasonably fast, as are screen updates of a window full of big fonts and pictures. The print quality is really professional, as is the screen output on a monochrome monitor. It wins hands down for ease of use over a lot of other WP type programs. For example, to include a picture along with your text, you practically just have to choose a filename, the text will automatically route around it (the picture appears right where the cursor is). Resizing or removing the picture is as easy as manipulating a miniature GEM window. The latest version has reportedly fixed the bugs in the initial release. Some of the printed pictures could have looked a bit better, though.

Practical Solutions was showing a triophonic/true stereo sound adapter board. Solderless and internal, it will be selling for $50 starting November. This, in combination with Yamaha's new 10-bit pin compatible, functionally compatible version of the sound chip (anybody know where I can get one cheap?) could open up possibilities for much better sound right out of the ST. The extra bits make a big difference. Why, just think, 6 more bits and we have CD quality B-). Anyway, PS's Videokey composite/RF converter/audio line box goes for $120. They were also showing their mouse, monitor, and drive master boxes, all three of which simply switch safely from one set of lines to another ($40-50). They say they'll sell bulk ST floppy and monitor connectors for less than $6.00 each.

Somebody (I don't know who) was showing midi-gram, what seemed to be a microphone that converted sung notes (i.e. sounds) into midi notes (i.e. binary), for use with any sequencer for recording. Don't know if this is specifically an ST product or simply a MIDI port hookup or what.

Of the few displays only showing games at this show (maybe the only one?), there was Broderbund. Nothing to note.

Antic Software was showing the usual 3D sterotek glasses (forms a crowd, but not really that impressive, folks). I didn't get to see their new CyberSculpt, the latest of Tom Hudson's creations, so don't ask. A lot of people were showing Spectrum 512 and Cyber pics, however -- mainly to show off their monitors or monitor attachments or the speed of their hard drives and such.

Megamax was showing their Laser C compiler, announcing that by Christmas they will have LaserDB, a source debugger, available.

Seymor/Radix was showing an impressive 75,160,216,300,360,600, up to 1000 dpi image scanner. Of course, the output can be used with all major picture formats and DP programs. Their printed output looked very good.

Last but not least Atari was represented at the show. Sig Hartmann was hard to track down, so I asked Cindy Claveran if she had any info on the 68030 UNIX box, but although she was very courteous, she had no comments about any possible release date. Somebody nearby also asked about the transputer. Essentially what she said about that is that all of the prototypes are now in developers' hands. That would explain, at least, why there was no transputer to be seen there. But I didn't see 1280x960 monitors popping up anywhere either. What *did* Atari show, you ask? Pretty much their whole current product line, all the way down to the game machines, running various types of software.

To: info-atari16@score.stanford.edu

When I uudecoded moriabin, i found that the header file for MORIABIN.ARC
was damaged. Did this happen everyehere, or am I doing something wrong?
BTW, our uudecode is pretty primitive, so I had to knit the files together
to decode it. I doubt this had any effect on this particular error as it
occured on the 2nd file in MORIABIN.ARC

HELP!!!!!!!!!!!

I don't know what I'm doing! I just downloaded LARN from the FIDO files. I unARCed the file
LARN12S.ARC and got:
-README-
FIXED.BUG
LARN.ARC
LARN.DOC
LARN.FTN
LARN.HLP
LARN.MAZ
LARN.OPT
OLARN.HLP
OREADME
TERMCAP.ARC

Was I supposed to get a file called LARN.TTP? What do I do with LARN.ARC and TERMCAP.ARC.
Do I need a special compiler? Would someone familiar with this game please contact me
either on this BBS or call me at 201-932-0597. Thanx.
Sincerely
David Hochhauser

Subject: low cost HARDDISK interface
To: INFO-Atari16@Score.Stanford.EDU

Sorry for the long pause after my first announcement -- but there was a lot
of work to do and I wanted to collect requests.

Due to the number of requests I decided to post some articles about the Atari
DMA port and my hardware solution, because they may be of general interest.
But the software is too large - I will try to store it (as source and as
executables) at a fileserver.

In this article I want to answer some common requests:

Hardware:
- The layout can only be photocopied , there exists no machine readable
version of it.
- The assembly is very simple - there is no need of an oscilloscope ,
a voltmeter is sufficient. Nearly all hardware errors can be detected
and analysed by the software.
- General remarks to Harddisks: (My experience, my own opinion)
- there is no harm in using harddisks with short seek rates (28ms)
instead of `slow' ones (40ms) (28ms are louder than 40ms). But I
couldn't recognice any increase in access speed - the operating
system and it's access to harddisk is more important. So I suggest
to invest your money in harddisk size and not in speed.
- Someone asked if it would be possible to install a ST157 (3"1/2)
instead of the floppy in a ST1040: answer: no :
- harddisks use other mounting screws
- there won't be enough space to mount the interface with the
OMTI controller (especially if you plan or have added an 68020,
memory expansions or SRAMs instead of (E)PROMs)
- hardisks need a lot of power and the ATARI power supplies are
weak (HD-Requirement: c 2A on 12V at power-up, c1A at 5V --
critical at seek operations)

Software:
- A MINIX driver will be written immediately after I have received the
ST version. Please send me a note when you received it in Germany.
- All programs which use legal GEMDOS and BIOS calls will work with my
driver - only programs that try to access the harddisks directly won't
work (besides HD format and partion utilities only a virus would try
to access the harddisk in this manner)
Until now we haven't detected a single program that doesn't work with

our harddisk (besides the ATARI hardisk driver & formater). Even all
harddisk backup programs like Turtle,... work correctly !
(some programs have troubles with too many partitions, so we allow you
to undefine and redefine single partitions)
- The software was developped for high res. monitors - no restrictions for
the driver, but our HD utilities will not work with low res. colour
monitors !!!
- Now all comments and helps are translated to English !
- The software can also be used in connection with the c't-solution (one
short source file must be substituted - no multiple DMA port usage)
- The boot software exits as a disk bootable version as well as a ROM
bootable version (ROM patch)
- Foreign utilities for GEMDOS speed increase and 40 folder bug solution
are necessary:
FATSPEED and GEMBOOT recommended
(Thanks to Ulrich Kuebler & Konrad A. Hahn)

I think the main reason for our solution is in fact the software:
- You can make use of 8 partitions with arbitrary drive IDs (you may use
K: and O: and keep C: for a RAM disk)
- You can connect several drives, several interfaces
- You can create, change, delete partitions at any time (the next version
will even allow you to move,enlarge and shrink partitions)
- The drive recognition scheme is `intelligent': you are allowed to
switch off drives and to reconnect them without rebooting your system
- The driver needs only about 4k of RAM (!)
- The utilities make full use of GEM
- ...

I hope that answers the most important questions. Those of you who had
further special questions I will contact within the next days.

What you downloaded was the complete sources for my port of Larn 12.0 to the ST. There are no executable files in that archive. The subfile LARN.ARC has the actual source code, and TERMCAP.ARC has the source for the termcap library, as well as a description of the ST's built in VT52 emulation.

I wrote this port using Mark Williams C version 2.0. All you need to do to get a working game is unpack the files and type "make," assuming you have that compiler. If not, then you're better off getting hold of the executables. Look for a file named LARN12.ARC (note the absence of the letter 'S' in the name...) and just use that.

A lot of copies of LARN12.ARC were distributed without the termcap description included. I've posted the termcap separately to this group a few times already, so you should be able to find it at an archive site.

Has anyone else run Larn from a BBS? It will work, if you redirect all three I/O descriptors to the serial port. (Actually, it might be best to leave stderr directed to the ST console...) I suppose it's not such a hot idea, after all, since you can't limit the time someone plays for. But since it uses termcap, you can support a wide variety of terminals in the game.

Dan,

I just got Dave Small's newsletter and I am fairly excited about this product. I don't know how to get to Dave on Usenet so I though maybe you could answer a few questions. He talks about a version 2.0 coming up in the near future; will this be a free upgrade from 1.0 or

will there be a charge? Second, is it absolutely necessary to have
a monochome monitor?

Thanks,

Norm Frech

^^^^^^^^^^^^^^^^^^^^^^^^ ^^^^^^^^^^^^^^^^^^^^^^^^
>Atari Host Adaptor board, I'll have more storage than I'll possibly need.
^^^^^^^^^^^^^^^^^^^^^^^^

This is what I thought, too. I replaced the Adaptec 4000 controller by
the 4070, which is completely compatible with the 4000, except that it
uses RLL encoding scheme instead of MFM. I also bought a second drive, a
Seagate ST157R, which is RLL and has a capacity of 49MB. The old drive
in the SH204 was (still is) an Tandon TM262, which is a 3.5", MFM, 20MB
drive. I checked out with Tandon, if that drive accepts RLL (i.e. if it
has plated media), and they said yes (although it was not certified for it).
Formatting the Tandon drive didn't cause any problems, but, however, it
has quite a lot of read errors. The errors do not appear in specific
sectors, but just randomly anywhere, especially on the cylinders with
low numbers, i.e. on the inner cylinders of the drive. It looks like it
mostly works just perfectly, but sometimes there are these read errors.
It seems that timing margins are so close, that it does not work
properly from time to time. A few days ago I got the PAL replacement
from BMS. It doesn't help very much, except that read errors are now
'officialy' being recognized.

If anybody is out there, who has similar experience, or who has a
solution, please post/mail it...

Tomas

I must agree with Dave. I have been using Sun workstations for about 3 years
now and I think it is the best devellopement system around.
The Sunview window environment is a joy to work in compared to other
windowing systems I have seen. Mex on the Iris is totally brain damaged in
comparison to it. I have nothing bad to say about Sun (the computer or the
company). I really hate it when some people give there 2 cents worth when it
is only worth 1. Alot of people don't give things a chance to improve, if
it does not work first time then they refuse to look at it again.

Subject: ibm compatibility
To: info-atari16@score.stanford.edu

im planning to upgrade very soon from my current televideo 803 cp/m
machine to one of the 68000 beasts...i have and have access to a great
deal of scientific and engineering software to run on an ibm pc
compatible machine but i detest the idea of *owning* an ibm
compatible, though inferior system...
could someone, an expert in the respective camps, e-mail information
concerning tthe ibm compatible nature of the atari st, themac, and
the amiga...i can get a mac at a reduced price through the university

and would like to have a hard disk system, a meg of memory, probably
color (but that is not entirely necessary), and ibm compatibility.
i need to know the cost of an ibm compatible system, or at least the
cost of the attachments needed to make it ibm compatible.
i appreciate it...thanks in advance...

> critical at seek operations)

I've done this. I had to use an Atari host adaptor board (since it is the
smallest), but it is quite possible, and was a hit at our local user group
meeting. Might add that it was an ST157N, with imbedded SCSI. It uses the
exact same holes that the 3.5" floppy does.

As Ron said, if you plan to add alot of other crud, it's not a good idea,
though.

The power supply was beefed by replacing the regulators with higher
capacity units, and a fan was installed to keep everything cool.
Otherwise, it works great.

The power supply can't be that big of a deal because Supra sells their
internal drive kits for the Mega ST, and they run off the Mega internal
power supply (which happens to be the same unit in my 520STfm, but
different than the one in the 1040ST the hard drive is mounted in. I bet
the newer 1040STs have the same power supply).

5779. Trying to do the impossible

Newsgroup: comp.sys.atari.st
Date: 1988-09-29 21:15:07 UTC
From: dmb@TIS.COM
Message-ID: <8809292115.AA23868@TIS.COM>
Source record: 250479

From the Western Digital WD1770/1772 Floppy Disk Controller/Formatter Manual:

Page 5 (p.1398, Atari Developers Documentation):

"...Writing is inhibited when the Write Protect input is a logic low,
in which case any Write command is immediately terminated, an
interrupt is generated and the Write Protect status bit is set."

This means that the write protection is checked AND enforced by the
disk controller _hardware_. The software has no choice in the matter.
Unless Western Digital is _lying_, you can't write to a write protected
disk no matter how hard you try.

Dave Baggett
dmb@TIS.COM (arpanet)

Unless we see a program that contradicts the manual, can we consider the
case closed? Unsupported arguments are _heresay_...

Someone mentioned that NeoDesk dodges the write protection. Anyone
want to testify to this?!?!? Will the author of NeoDesk confirm/deny?

I wouldn't dream of doing that, but I will suggest that you take your drive in to an authorized service center for repair. I don't doubt that you can indeed write to write-protected disks, but that is indicative of a broken disk drive, not a design flaw.

These are my opinions, and in no way reflect those of UCSC, which are wrong.

I beg to differ. Write protection is usually a hardwired protection on the disk drive. The OS and programs can, however, neglect to pay attention to this fact and try anyways.

As an example, early versions of Twister (a skewed track formatter) have been known to "format" write-protected disks. That is, they went through the motions but the information on the disk remained intact.

5782. Re: problem with mwc atoi(), version 2.0.1

Newsgroup: comp.sys.atari.st
Date: 1988-09-30 02:43:22 UTC
From: Gribnif@UMass.BITNET
Message-ID: <88092922342756E.BGJC@Mars.UCC.UMass.EDU>
Source record: 250482

I believe the problem with the following:

```
> printf("%d %d %s %d %d %d\n",
> x, i, argv[i], (double) x / MAXVAL, atoi(argv[i]),
> (double) x / MAXVAL * atoi(argv[i]) + 1);
```

is not in the atoi() function, but in an incorrect printf() format spec. Since the two calculations involving "x" are typed to "(double)", the format spec must be "%f", "%e", or "%g" for these two numbers. Otherwise what happens is that printf() reads an incorrect value off the stack.

In order to use floating-point printf() routines under MWC, you must also compile with the -f (or -VFLOAT) option.

I am a member of our local university Centre of Musical Activities' Electronics Music Laboratory (EML). Currently, we are working on a project on the Atari ST computers to sequence compositions made by our members. We have in mind a Audio and Video presentation of our works in Electronic/Computer Music. Recently, we got a software Trip-A-Tron from LlamaSoft - U.K. - written by Jeff Minter. It can use MIDI to control this 'light-synthesizer'. It has great potential but we are overwhelmed by the capabilities of the software. Does anyone have any experience with this particular software? Any help will be much appreciated.

>Is there a way to capture postscript output from Timeworks Desktop
>Publisher into a file? I don't have a lazer printer, but have access to

I don't think so. I have looked, with a protocol analyser, how Timeworks
manages a Postscript printer. First, Timeworks asks the printer for its
comm parameters in order to know which kind of flow contol is used.
If the options value of this parameter is not 0 (which is the default value
for a Laserwriter) Timeworks assumes RTS/CTS. If the printer does not answer,
TW asks you for a new printer.sys.
Is there anybody who has used TW with a parallel interface PS printer, such
as QMS PS810?
>
>This probably means re-installing it for a postscript lazer printer
>(mine is installed for the Epson LX) and then somehow capturing or
>re-routing the data that would go into the printer port upon printing.
>
>Is this possible? If so, how?
>
At least, you must install TW for a PS printer because fonts names and kerning
info are NOT the same!

What is the last version of Timeworks? What about ZapfDingbats and Symbol fonts?

Here in France, the distributor of Timeworks is .... Atari France!
All ads for 1040/Mega ST line are about the theme: you can't find a better
choice for laser wordprocessing than the ST (the WP package includes, for the
1040st a french wordplus clone, written by D. Laurent (et al.), the author
of Turbodos. VERY quick - and Timeworks for Mega ad)

The wp software, called LE REDACTEUR (The writer) has been developped
for a french newspaper, LIBERATION, hence speed and some features for this
type of business: text analysis, index, word occurences...

LIBERATION has bought around 100 ST, and now another newspaper, OUEST-FRANCE
(800 000 ex/day) used Atari! Good references for an advertisement!

See you later

5785. GCC Problem

Newsgroup: comp.sys.atari.st
Date: 1988-09-30 12:41:27 UTC
From: paone@topaz.rutgers.edu
Message-ID: <Sep.30.08.41.26.1988.449@topaz.rutgers.edu>
Source record: 250485

Help...

I downloaded the gcc arc files about a week ago. I think I followed the directions exactly, but I keep getting two bombs. I am running it from gulam as suggested and I have 1 meg of memory.

Another thing is the stack size. Someone posted a change of 500000 to 300000. Is that a decimal value? The hex is 7A120, but changing that didn't help either.

Any suggestions?

>Those guys have the potential for spreading the doom and gloom over a vast
>geographical area...and it sounds like some of them intend to do just that.

I really feel sorry for Atari, sometimes. No matter *what* they do,
they catch flames. Many moons ago it was noted that when you bought a
computer via discount mail-order, you got what you paid for (a
computer), and that was it. No support, no hands-on demos, no contact
with other users. On the other hand, when you buy from a dealer, that
dealer can demo software for you, repair the machine in-house
(usually), give you pointers and help, and you can meet other users in
their store. For all of this, you pay a higher price than mail-order.

You can see the latest whizz-bang frob, watch somebody get blown away
by the latest hot new flight-simulator dungeon arcade adventure game,
or find out if the latest word processor program will really print Old
High German in genuine gothic lettering. With mail-order, you pays
your money and you takes yer chances.

Atari wisely, in my opinion, decided that if they were going to ever
establish the ST as a "serious" computer (on par with the Mac and the
IBM PC), they had to give dealers an incentive to carry and *support*
their machines. What was the dealers' main gripe? "We're being
undersold by mailorder!" Solution? Stop selling STs to
mail-order-only suppliers. It was a logical, carefully considered
business decision.

Think about it. A company does not arbitrarily cut off sales outlets
for its products. It has an obligation to its stockholders to try to
make a profit. They are trying hard to make a distintion between
Atari game machines, sold by mail order and in department stores
everywhere, and the ST line, now sold only by "qualified computer
dealers". Atari needs now to get the word out that the ST is
"Available at your local Atari Computer Dealer". It is the right
move. I only hope it was made at the right time.

>On the upside, word is that the university discount prices of macs are about
>to take a jump upwards, which will make STs look better. On the downside,
>IBM, Toshiba, and Zenith are now offering discounts here, and they have some
>good deals.

I don't know what the discount looks like on a Mac, but given what it takes to make the Mac a usable computer (it *requires* a second drive), I couldn't touch one for less than $2000, and that's monochrome-only. I have only $1500 invested in my ST hardware, with both color and mono, and two double-sided floppy drives. I could add a hard disc for about $700, but I feel no need to; the ST is usable with two double-sided floppies. I couldn't touch a PC for less than $4000, nor would I want to.

No, price isn't really the issue here; marketing and image is the issue. If Atari is going to make inroads into the business mainstream, they are going to have to grow out of their games/ hobbyist/hacker machine image. Unfortunately when they do this, they will leave some of us behind.

^Y (control-Y) is the delayed suspend character. You can change this to
anything you want on most UNIX systems (including Sun) by doing (e.g.):

% stty dsusp ^A

to change it to ^A (control-A). I do this all the time so I can run up-left
in certain screen-oriented programs :-) without popping out to the shell.
Once you have set dsusp to something else, ^Y is just an ordinary character.

There, wasn't that easy?

This is correct. I did the same test. Well, I did put in onto the net also.

> It _is_ true that the physical screen base doesn't actually set until
>the vertical blank. This is because Setscreen simply writes a value into
>a location in page 4. The _vertical blank routine_ looks at this location
>and sets the physical base. We're talking about an interrupt here.

No. This is not correct. The physical screen base *IS* altered
immediately; the reason this has no effect until the next vertical
blank is that the video counter that generates addresses pointing into
the screen memory is still happily incrementing and will be reset to
the new screen start location only when it is about to rebuild the next
screen, i.e. at vbl time. This is hardware stuff, and has nothing to
do with the code that the vbl routine consists of; you can try it for
yourself by setting the vbl semaphore ($452): decrement the vbl
semaphore making it negative; now the code inside the routine won't get
executed, but still the screen start address is updated! Note: you must
not disable the vbl itself by setting the status word, as this will
effectively disable the interrupt and hence the refill of the video
counter.

I think you're mixing up some locations in page 4.

$44e _v_bas_ad (logical screen base)
$45e screenpt

The first one is the logical base that is used by all routines that want
to produce output to the screen. Having logical and physical screen

different means you can prepare a picture in the first, while showing
the old picture in the other.

The second one, screenpt, is used in the vbl routine as follows: if
screenpt is not zero, both the physical and logical screen base will be
reset to this value. Note the physical screen base has no associated
RAM location; it is set by filling in two I/O addresses, which
correspond to the shifter's counting base register.

Screenpt is *NOT* set by SETSCREEN! SETSCREEN sets either physical,
logical base or resolution or any combination of the three. Only if the
resolution is being set, SETSCREEN waits for a vbl.
Screenpt could be used for animation, were it not that setting both
logical and physical screen starts make it less usefull for that.

> So you do have to Vsync after setting the physcial screen to be sure
>you won't get flicker. To illustrate:
>
[example omitted]...

Not quite true. In fact this can slow down fast animations considerably.
If you generate new frames at a rate lower than the vbl frequency it's OK,
but if you generate at a higher rate this means you'll have to wait each
time for the vbl. You could argue you still can't display at a higher rate
than the vbl, which of course is true, but not waiting for the vbl means
in effect once and a while skipping a frame (as you indicated).
The flicker does not result from not using Vsync but from writing in a
screen memory that's being displayed. I posted this before, but some extra
explanation won't harm:

Most people use two screens when animating. This is ok if you synchronize
by using Vsync(), but it leads to trouble when you don't. For clarity I
introduce the notion of actual screen memory, which is the memory currently
being addressed by the shifter. Having screen memories A and B:

```
Actual A A A B
Physical A B B B
Logical B A A A
^ ^ ^
| | |
time axis ---> SETSCREEN write log vbl etc.
```

If the logical screen gets updated between a SETSCREEN and a vbl it
also affects the actual screen (they're both A), so there's trouble.
The solution is to use (at least one) extra screens, traversing them
cyclic and having the physical screen walk 'one behind', viz.:

```
Actual A A A B B
Physical A B B B C
Logical B C C C A
^ ^ ^ ^
| | | |
time axis ---> SETSCREEN write log vbl SETSCREEN etc.
```

It can be shown that having two SETSCREEN's within a vbl period still can lead to flicker; the solution is to use more screens, or to await the vbl if you already had two - the wait time now being much less than in the original case. Trial and error are good judges in these cases, along with your criteria for what looks nice on the screen and how much screen memory you have to waste.

> Unless my compiler is different from everyone else's (I'm usnig
>Laser C), this is how Setscreen works.

Well, close.

> David Baggett
> dmb@TIS.COm (arpanet)

Well thats true if you take the Apple `lets do everything in
software' approach. The other alternative is to use buffers from/to
which the CPU can transfer data as needed. In fact, it is conceivable
that all the packetiztion etc be done by a simple processor, and then
shipped thru the cart. port., a packet worth at a time, or at some
appr. granularity.

In article <1425@nunki.usc.edu> rjung@sal6.usc.edu (Robert allen Jung) writes:
>> I was looking through one of the Amiga rags he other day and - surprise -
>>Soft Logik is doing a PP for the Amiga. Isn't that strange?
>
> Nope. Quality software eventually gets translated for lesser machines. B-)

Nope. If you talk to the author you will discover that PP was written
for the ST first because ``If we could make it work on that pig, we
could make it work on anything.''

I'm only in this for the mummy.

>Jos Vermaseren asks:
>> This leaves the question: why is the American preference for color so much
>> greater than in Europe? I posed this question a long time ago, but nobody
>> could come up with an explanation. Anybody has one?

Americans, in general, have more disposible income than the rest of
the world.

I'm sure the European preference for colour is just as great, but
the *relative* cost is higher. Same for other toys like CD players.

I'm only in this for the mummy.

=========================================================================
COMP-U-SERVE ~ GENIE ~ DELPHI ~ THE SOURCE
=========================================================================

From the Editor's Desk,

In more ways than one we can agree that in the Atari Community strange
things are happening and that Atari is trying to make it seem normal. It
gets to such a point that I, speaking very frankly, wonder where it will
all lead us. We have now lost one of the people who has been a part of
the Atari scene for quite some time. Neil Harris, (I don't want this to
sound like a eulogy), has, at times, caused all of us to raise an eyebrow
or two but believe me,....

"you ain't seen nuthin' yet!"
```

As an individual who has a certain amount of responsibility to the folks who work diligently in different parts of the country for ST REPORT, it is safe to say that if one of them were to hand in a resignation with a terminating date we WOULD honor that date. I have always found that the abrupt method and abuse of power by company execs usually offends more folks who are observers of these sort of things than you could imagine. The entire Atari Userbase is, in fact, observers in this matter.......

I know that when you see a high official in any company say, "Ah,...your two week notice eh? Well, you have two hours to clear out your desk and get gone!" This will irk even the calmest of individuals. From all outward signs Neil tried to do the very best he could for Atari. For that reason and perhaps that reason alone the parting of company for both entities should have been more amicable. It is easy to say now .. "You got your rewards for all the days you worked damn near around the clock for those guys..." The sad truth is, most of us have said the same thing to ourselves at one time or another!

We all have read humorous stories and heard dark tales about how the head honchos at Atari like to stalk the halls "upstairs" puffing out their chests in temper tantrums and such, well, it's situations like these when you see folks like Neil Harris get the "out the door" treatment to an otherwise calm, normal 2 week notice of resignation that you begin to believe the stories and rumors are TRUE!

ST REPORT feels Atari owes the ENTIRE USERBASE an explaination.

- You can't tell us Neil had a "45 day contract".

- You can't tell us he was abusive to the people he dealt with.

- You CAN tell us exactly why NEIL HARRIS is no longer with you.

- Why, in the last 18 months has the turnover INCREASED.

The Revolving Door at Atari has indeed become a NATIONAL JOKE! (Disgrace). In fact, Atari's entire attitude toward the U.S. Marketplace is sad and quite confused. The situation demands an information release detailing:

"THE US GOALS AND IMPROVEMENTS BY ATARI U.S."

This is a very much needed prescription. (a word to the wise)

We have "heard" that Neil has very strong personal reasons for wanting to be on the east coast of the nation and had asked for a "leave of absence" only to find that the "Federated" assignment was far too critical to be without Neil's attention and therefore... the resulting resignation. (Federated is getting VERY costly)

A final thought..to you Neil, we have thoroghly enjoyed your comments, even though at times it seemed otherwise, you have displayed a unique way to "keep the juices flowing". Good Luck to you at GEnie and above all else we at ST REPORT do include your Mom in our prayers and hope everyone will.

Rex..........

SPECIAL SUPRA MODEM OFFER!!!
==========

CompuServe's Atari Forums have made very special arrangements with
Paramount Products Inc. to offer the members of our forums the chance to
upgrade your system to 2400 baud service at a very special price.

For a limited time, CompuServe subscribers may purchase the

SUPRA CORP. 2400 baud Hayes-compatible modem
for the very **LOW** price of just $139.95 !!!!!

These are brand new, not reconditioned units, with the full SUPRA CORP.
warranty. The SUPRA MODEM uses the Hayes Smartmodem 'AT' command set and
operates at 300-1200-2400 baud. It's an outboard unit (not an internal
plug-in card) allowing ease of transfer to other computers.
Connection is thru the standard RS-232 interface. (Just plug it into the
back of your ATARI ST).

To take advantage of this special offer, Phone the 800 number
listed below or write to:

Paramount Products Inc.
1405 S.E. Pacific Blvd.
Albany, Oregon 97321

***** Phone orders: (800)444-4061 *****

Price: $139.95 + shipping
UPS ground: add $4.00
UPS Blue label: add $8.00
C.O.D.: add $2.25

MasterCard or VISA accepted Orders will be shipped the next business day

If you've been accessing CompuServe at 1200 baud, this is a great way to lower your total online bill since CIS does *NOT* charge a premium for 2400 baud access. (You can get the same amount of information or download the same amount of programs in approximately 1/2 the time as 1200 baud users!) This modem will PAY FOR ITSELF in just a few sessions.

THE PRESIDENTIAL CONFERENCE
==========

ATARI TOP EXECS TO ATTEND PUBLIC FORUM

The Atari Forums on CompuServe will be sponsoring a world-wide electronic Teleconference with Sam Tramiel, President and Chief Operating Officer, Sig Hartmann, Executive Vice President and Software President of Atari Corporation and Neil Harris at the keyboards on Monday, September 26 at 9:00pm EDT. Your participation in this conference is welcomed and encouraged!

Due to recent events the presence of Neil Harris as an intermediate for Sam Tramiel is doubtful, but we are fully confident that Sam Tramiel, in keeping with the Atari Tradition, will, by all means possible, be present for this landmark conference along with other (TBA) Atari Execs.

Heroes of the Lance
==========

Loaned from I.B. Computers

by Nabil Pike(PAC)

Ok! Tired of the same old games? Haven't seen any really good adventures out lately? Want something new? Then Heroes of the Lance is the game for you. Based on one of the many plots in the bestselling Dragonlance Chronicles, this game takes you the player into the world of Krynn, where mortals have forsaken the gods and the dark goddess Takhisis plots to take over the land with her hordes of evil dragons. You control the eight companions (you're not heroes unitl you succeed in your quest) and venture into the shattered ruins of Xak Tsaroth to recover the Golden Disks of Mishkal and restore belief in the old gods.

You have eight characters in your party, but only one may be active at any one time. Tanis, the half-elven fighter. Caramon Majere, warrior and brother to Raistlin. Raistlin, mage and brother to Caramon. Sturm

Brigthblade, the aspiring Knight of Solamnia. Goldmoon, the chieftain's daugther, who ran away with Riverwind. Riverwind, the outcast member of a tribe of plainsmen, who fled from his tribe with Goldmoon. Tasslehoff Burrfoot, the member of a race of short thieves. And last but not least Flint Fireforge, the continually grumpy but good natured dwarven fighter.

With these eight adventurers you must venture into the depths of the ruined city in hopes of recovering the Disks of Mishkal and restoring belief in the old gods.

The game is based on the Advanced Dungeons and Dragons Role Playing System, but it is designed so that the computer takes care of all the mechanics, "behind the scenes." To allow you play the game without the extra work of continually stopping to roll dice, subtract hit points, ect. Each character is given full stats and Raistlin and Goldmoon have the ability to cast spells.

Maneuvering is done with the joystick as is combat. Pushing the joystick in the various directions gives you the option of walking or running either left or right. You may also enter into or out of doorways by pressing up or down on the joystick. Pressing the fire button does one of two things, if you are standing still when you press the button you enter into either close or ranged combat mode, remaining there until you release the button. If you are running when you press the button it allows you to jump, which is neccesary in overcoming certain obstacles.

Combat is of two types either ranged combat, involving the use of a missle weapon like a bow, or close combat which uses the character's sword, staff, ect.. Combat is entered into by pressing down on and holding the fire button. When you enter this mode the word "combat" will appear in red letters in the lower left hand corner of the screen. Combat gives you the option of shooting/hitting(depending on whether you are in close or ranged combat) either high, center, or low. Along with these options you can also dodge by pulling down on the joystick, this makes the active player duck until you release the stick again.

Any other actions are done from the main menu which you get to by pressing the space bar. On this menu you can change the active character(the one that shows on the screen), cast mage or cleric spells, take, use, give, or drop items, plus the option of saving the game.

Now that you know a little about the game you're ready to go. But don't be too eager because after you fight your way past dragonmen, mercenaries, trolls, wraiths, spiders, spectres, and young black dragons you must attack and defeat Khisanth the ancient black dragon who guards the disks. To aid you on your way, you will find various scrolls and potions in the ruins. Remember, success doesn't come easy, if you don't succeed the first time, play again! After all, the fate of Krynn is now your sole responsibility.

ST REPORT CONFIDENTIAL
======================

Sunnyvale, California Sept. 23, 1988 (c) APEInc. ST REPORT (RReade)
---------- Neil Harris, known to the majority of users in
the Atari Community has resigned from His position
at ATARI CORP.

Rockville, Maryland Neil Harris, formerly of Atari, will assume new
---------- responsibilities in the employ of GEnie
Information Services.

Sunnyvale, California Jim Eisenburg, one of two who created the artwork
---------- for the desktop we enjoy using is no longer with
Atari.

Houston, Texas The story from here is the folks at the C of C are
---------- rather "tired" of waltzing Matilda, and are about
to drop the entire issue like a HOT ROCK!

Las Vegas, Nevada Insiders say the "cheap" accomodations are booked
---------- for the Comdex Dates. There are plenty of medium
to expensive rooms available though.

Miami, Florida Seems there are real problems in the SE US for
---------- Atari. Florida, long known for it's large Atari
userbase is starving for HONEST LEGIT DEALERS.
The few good ones left are on the verge of dumping
Atari because they can't get a REP to call on them
or get product.

GOLDEN GOUGE AWARD
==================

Jacksonville, Florida

A rather enterprising Atari Dealer has taken the term, FREE ENTERPRISE, a
stretched step further. Seems this dealer offers the Early Atari RGB
Color Monitor for 499.00 (used)!

He accepts trade-ins against the new stylish (mega) monitor and then
resells the old used monitor for almost $500.00!

This same guy gets 2.00 per page to run off docs on "his" SLM804.

A PERFECT EXAMPLE OF REAL ETHICS!

ED. NOTE....the Golden Gouge Award is a new feature of ST REPORT, if you
have a dealer in your area that is exploiting the fact that Atari dealers
have little or no competition, or, is just plain ripping people off..let
us know by nominating that dealer for the Golden Gouge Award.

TRUE ATARIAN AWARD
==========

Orlando, Florida

Our very FIRST nominee and Winner of the coveted ST REPORT True Atarian award goes to:

McDONALD'S COMPUTER CENTER
4921 East Colonial Drive
Orlando, Florida 32803-4309

Bob McDonald, by his efforts has nurtured and guided the Atari Userbase in his area in many ways..one of which is allowing the user groups to meet at his dealership after business hours. That means long days and short rest periods for him.

Your ongoing efforts to display the true characteristics of good business practices and the example you set by your own actions are a tribute to Atari and are excellent guidelines for all to follow.

ED. NOTE... You may nominate a dealer for the "TRUE ATARIAN AWARD" which, as the name denotes, goes to the real good guys, those dealers you are proud of, who take care of the userbase, who respond to the needs of the community and are ethical and upstanding in every way. Nominate your favorite dealer today...if he deserves it.

#: 111449 S7/ST News/Reviews
24-Sep-88 15:06:53
Sb: Farewell
Fm: Neil 70007,1135
To: All

Since the word is already spreading, let me make it official:

I tendered my resignation to Atari on Friday. As is customary, they made it official at the end of that day.

Within the next 2 weeks I will be joining GEnie in the DC area. I am very much looking forward to the position and to moving my family back to the East Coast.

Thanks to everyone for making my 4+ years with Atari Corp. interesting.

--->Neil

INSIGHT into the ST'S FUTURE
==========

Part II-Hardware

by Micheal Arthur

One developer who has already had a great effect on the ST market is Dave Small, bringing Macintosh compatibility with the Magic Sac. For reasons too lengthy to discuss here, he left Data Pacific, the maker of the Magic Sac, starting his own company, Gadgets by Small Inc.

The Magic Sac WAS good, but it only used the 64K Mac ROMs, not being able to run some old Macintosh programs, and not beign able to run most of the new ones, such as Hypercard or Multifinder.

To remedy this, he has made another Mac Emulator, called Spectre 128, that uses the 128K Mac ROMs. This means it can run virtually ALL Macintosh software (except MIDI programs), including Hypercard. Using 128K ROMs also results in screen operations being four times faster than with 64K ROMs, and that the serial (modem) drivers WORK, so most to all Macintosh modem programs (like Red Ryder) work with Spectre.

Besides the benefits brought with the 128K ROMs, Spectre 128 also has an INCREDIBLE increase in Disk I/O, having floppy disk operations up to three times faster than the Magic Sac, and hard disk operations up to TEN times faster than before.

Alas, in its first release it does NOT fully support Multifinder, however, Version 2.00 will support Macintosh sound, the Atari Laser Printer, and will FULLY support Multifinder. This will mean many things to the ST market, as it will now fully emulate the Macintosh, and with a price that will definitely be preferable.

Especially to Mac Users, who, as a result, will see the ST as a Mac Clone, buying it mostly to use a cheap Mac to do work at home, or to have an extra Mac for the office, in addition to the "real" ones there.

This will cause a LARGE, sophisticated group of computer users to become ST users, as familiarity with the ST will breed enthusiasm for it, instead of contempt, bringing Macintosh developers to the ST market, and more software, in the process.

Special Note: As this is a small company (no pun intended), they cannot advertise that well, but WILL provide good support. You owe it to yourself to find out about Spectre, from Gadgets by Small, Inc.

Megabyte Inc.

One company, that in the coming months, will come to be a household name in the ST world, and which will definitely have an effect on the future of the ST.

Megabyte Inc. will be releasing a product shortly called Turbo ST, that will use a 16 MHZ 68000 to speed the ST to 16 MHZ, with a switch to go from 8 MHZ to 16 MHZ instantly, even within an application, so as to be able to use that speed when you want. This will make the ST even faster than Amigas with 16 MHZ 68020's, which only go at 14.32 MHZ. It will require a motherboard modification, though.

A major modification. This board uses 18+ chips to perform its job, and installing it in an ST will take 2 HOURS for an experienced technician, making it more like a quadruple bypass operation than anything else. It DOES fit completely into an ST, having sort of an odd shape as a result.

There will have to be a piece cut out of your ST, though. In the back, where the 8 MHZ/16 MHZ switch will go.

This is the ONLY ST Accelerator board that is coming out any time soon, costing about $250.00, including the 16 MHZ 68000. It is also guaranteed.

This will certainly have a great effect on the ST market, and although a certain few doubted it could be done, Turbo ST will be coming out within a few weeks.

But it's the *OTHER* product that Kenneth George (maker of Turbo ST) is developing that will REALLY be interesting.

Ever since the beginning of the ST, one of its worst handicaps was that there were no expansion slots in any model, hampering attempts to expand its capabilities. The Mega ST solved this problem in part, by having one expansion slot, but anyone who has ever used an IBM knows that even four slots aren't usually enough, so only having one decreased its value.

The Amiga 2000 has 8 expansion slots, resulting in that there is a growing market for Amiga expansion cards, causing some people to think that the Amiga is a more viable option than the ST.

But now, that is ALL going to change.

Megabyte Inc. is planning to come out with an Expansion Slot Box called the ST Expander), that will give 520/1040/Mega ST's eight Expansion Slots, for around 200 dollars. It will be out in December.

This will also require a motherboard modification, but this will be MUCH less drastic than the Turbo ST's, and will be SIMPLE if you have the Turbo ST, as there will be a socket built into it so you can just plug in the ST Expander, but even if you don't have Turbo ST, your dealer can make the necessary modifications with little trouble.

The ST Expander also solves one other thing that the Amiga has over ST's.

As we all know, the Mega ST's have more built in memory than ANY other computer. But that memory could not be expanded beyond 4 Megabytes. This has been because the "MMU" chip inside the ST only lets it address that much memory.

Although the 68000 itself can address 16 Megabytes of memory, and ALL models of the Amiga support 9 Megabytes of memory with the 68000 chip, and 16 Megabytes of memory when a 68020 chip is used.

Noticing this, Megabyte Inc. decided to put an improved version of the MMU chip inside the ST Expander at NO additional cost that supports the ENTIRE memory addressing range of the 68000, 16 Megabytes of memory, when you buy one. Compared to the Mac II, which only supports 8 Megs with a 68020.

Two of the slots in the ST Expander will be dedicated RAM slots,to support memory expansion cards. These will be easy to obtain, as ST users will be able to get them from one of the many companies that will be making expansion cards for the ST.

CREATING an entirely NEW market for the ST, and having MANY implications. Some products that will probably come out at first are:

1) A LAN System that would be compatible with IBM, SUN, and DEC Networks.
2) A GLUT of Memory Expansion Cards for the ST.
3) A 1280*960 Monochrome Monitor with an expansion card to make it work.
4) An Expansion Card with the 68881 chip for a floating point coprocessor.

And MANY more developments, including......

A "Bridgeboard" for the ST, having the 286 or 386 chip....

This product has the potential of causing an upsurge in ST hardware AND software development. It also will make Megabyte Inc one of the biggest companies in the ST market, and possibly in the microcomputer market, as it (and Turbo ST) might help make the ST a standard among microcomputers, and definitely help MANY ST's to sell, making their products have even greater demand.

In fact, I would say THAT after the next 10 months, 1 out of every 10 new ST's sold by dealers will either contain Turbo ST, ST Expander, or BOTH, and that within a YEAR, 1 out of every 10-15 STs currently out in the US will have at least one of these products.

These predictions might seem incredibly bold, but it might turn out that they will have been very conservative, and that Megabyte Inc. will have a quicker effect on the ST market than ever thought of. And most ST hardware made next year will probably be designed for the ST Expander.

ST XFORMER Interface Announcement
==========

by Darek Mihocka

Always wished there was an easier way to transfer files from your 8 bit floppies to the ST? Are null modem cables just not your style?

Finally! Move all your Atariwriter and other word processing files to the ST. Graphics screens and icons. Database files and spreadsheets.

It's ready! About a month ago I first announced the development of an interface to allow STs to communicate with 8 bit disk drives, like the 810, 1050, and XF551 drives. I will start shipping them on Oct. 3.

The interface consists of a cable that connects between the ST and the disk drive, and allows for two way disk and file transfers, with the proper software. This software is in several forms, for different users.

Because the cable does not necessarily require that it be used with the ST XFORMER emulator, it is going to be sold separately from any software.

To be fair to current registered users of the ST XFORMER Atari 8 bit emulator, they will have first crack at the cables. To qualify, you must have already registered your copy of Xformer 2.1 ($20). (I have your names on file, so don't cheat!) The cable will then cost you $20 US (or $25 Canadian). In conjunction with the release of the cable, a new version of the ST XFORMER will be made available on Oct. 1, and as usual, will be made available on Compuserve, Genie, and Delphi. XFORMER 2.2 will have all of the features of version 2.1x with the added capability of using the cable to boot the Atari emulator directly from an 8 bit drive. (Even from copy protected disks, although not all of them)

The few users who have just registered recently for version 2.1 are being kept on file until October and will receive version 2.2, since other enhancements have been added to the program.

This leaves tens of thousand of ST and 8 bit users who do not qualify. For you folks, the cable is $25 US (or $30 Canadian), and of course, you will have access to ST XFORMER by modem or by registering. Registration for the XFORMER is $20, but since I am eager to get more users, you can get the cable, XFORMER 2.2 and the printed manual for $40 US (or $45 Canadian).

For those people who want the cable to transfer files, but are not interested in the emulator, I have a utility for you! The XFORMER Quick Transfer Utility allows you to grab files of entire disks and transfer them quickly. Those of you who saw the several megabytes of 8 bit ANALOG files that I recently uploaded to Compuserve and Genie may be interested to know that each floppy disk took under two minutes to transfer to the ST (the same time it takes to read the disk into a sector copier on an 8 bit). Imagine how quickly you can transfer your entire 8 bit library to the ST (where, one day, you will decide to run it on the emulator).

The current limitation is that the disks must be in DOS 2.0 format to allow the files to be extracted, although if you plan to use the emulator, the disks can be formatted by most DOSes, and even be boot disks.

I am still working on several other major utilities, including one that allows most other ST programs to read and write directly from the 8 bit disk drives, and more. When it is ready, I will let everyone know.

Also in the works is a 520ST version of the emulator that supports the interface (an enhanced ST XFORMER JUNIOR).

To order, send a MONEY ORDER or (no personal checks from the US!!! because Canadian banks are not too swift at processing them) to me:

Darek Mihocka
310-D Bluevale St. N.
Waterloo, Ontario N2J 4G3
CANADA

Thank the almost 100 registered users of ST XFORMER who motivated me (and demanded!) that this interface be created.

Pricing is as follows.

Registered users:

US $ Canadian $
ST XFORMER Interface Cable 20 25
ST XFORMER 2.2 update
(with Quick Transfer Utility) 10 10

(note, users who just registered in the last couple of weeks will get the update free in October)

Non-registered users:

US $ Canadian $
ST XFORMER Interface Cable 25 30
Quick Transfer Utility 10 12
ST XFORMER 2.2 registration 20 20 (shareware)
All 3 of the above 40 45

Please add $3 per order for my postage and shipping costs.

I would like to get users groups involved in this. I have visited about half a dozen local user groups and found a lot of interest in the emulator and interface. The problem was that many of the users, both 8 bit and ST, do not have access to Compuserve or Genie, or even a modem, and so, were unaware of the existense of the emulator. Therefore, I would like to give discounts to large orders placed through user groups, because it helps me. Call me by voice for details.

Oops, did I mention the BBS yet? As mentioned last month, I am going to put up a support BBS shortly. I am writing it from scratch, but it is coming along. It will provide additional support for all Atari users, by providing information about the emulator and interface, and files for downloading,

ST XFORMER BBS / voice support (519)-747-0386

BBS: 12am-6am EST (sometime soon)
voice: other times

During other hours, I will answer by voice and provide support for the products.

Thanks again for your support.

CIRCUIT MAKER
==========

by Bill Pike (PAC)

review copy loaned
by IB Computers

My field of endeavour, that which I do when not using a computer, involves a lot of logic circuit design. Well anyhow I was going thru the local software store and happened to see a program on the shelf that immediately caught my eye. The name of the program is CircuitMaker and it was written by Ozzie Boeshans. The cost is $69.95, why not make it a even $70?. The program is published by ILLIAD Software.

For those who havn't used this type of program in the past, this includes until now me, this is the cats meow. No more breadboarding of circuits. No more burning out chips. No more tangles of wire, piles of parts, and general mess laying all over the place. Also, for those who are married, no spouse telling you to clean up your mess.

Version 1.2 of the program allows you to design various logic circuits on screen and TEST AND DEBUG THE CIRCUITS ON SCREEN. The program then will print the circuit on your Epson compatible printer. You can also go back to the last saved version of the circuit if you have made a mistake. The next version, 2.0, is said to allow you to specify and make a library of your own favorite IC's. Didn't I say that the program comes with 1 library of various logic gates and IC's? Well if I didn't, it does.

Here is what is in the library: All of the various types of gates including, a inverter, 2-4 input AND & NAND, 2 input ORs, 2 input NORs, and 2 input exclusive ORs, LED's, seven segment displays including the BCD to 7-Segment decoder, switches, two types of quad latches, 7474, 74138, 74151, 74168, 74169, 74109, and 74194 IC's.

There is a snap-to-grid feature so everything looks neat. The various logic devices can be rotated in 90 degree increments, you can label either vertically or horizontally. When you are wiring the circuit the curser is accompanied, once you move out of the device area, by a set of full screen cross-hairs that show you where the wire will end up both vertically and horizontally if you extend it the full screen. This allows you to be much neater in the layout of wiring. There is also a dot placed where wires join so that you are sure of the connection. You can also move devices around or delete them if you decide that the location is bad. You are working in a window of the design, the window is approximately 15% of the working area. You can wire outside of the screen area. I find that you should make a printout of just the device placement so you are able to easily find the devices not on screen when you start to wire. A zoom command would have been nice.

There are programmable pulse generators for signal inputs, each generator is independently programmable as to waveform and start time as well as well as when it starts. The speed is variable in

common. There is a four input oscilloscope that can be used to check any four points in the circuit simultaneously.. You are able to either use a continous run or set for 5 or 10 cycles. The various wires show you the logic level on that wire by either being solid black (logic 1), dark dotted (logic 0), or light dotted (not active) as the test is running. If you are using a color monitor the colors of the lines change to indicate the same conditions. You are able to move around the screen during the run so you can see the functioning of the entire circuit.

There is a tutorial on fundamental logic circuit design included in the small 50+ page manual. The tutorial doesn't go into much depth and those who are unfamiliar with logic design should pick up a book on the subject as well as a TTL Device handbook so you can figure out just what the various chips are and what they require to work. The program doesn't go into microprocessor logic and if it did it should/would probably cost about 10 times as much, if not more.

This program is designed for the average designer and builder not for someone who does this for a living, he/she would probably have the $700 to $7000 version of this type of program and a main frame to run it on. This is a MUST HAVE program for anyone who designs logic circuits including those in college level logic design courses. It is also a must have for anyone who just does logic design at home for their computer interfaces or anything else, this is most logical (sorry about that it slipped out). So dig into your pocket and BUY THIS ONE.

Professional GEM by Tim Oren
Column #5 - Resource Tree Structures

This is the fifth issue of ST PROFESSIONAL GEM, concluding our trek through GEM dialogs and resources with a look at the internal structure of object trees. Also, I'll answer a number of questions of general interest which have been received via the ANTIC ONLINE FEEDBACK. As always, there is a download file associated with this column: GEMCL5.C, which you will find in DL3 of the new Atari 16-bit SIG (type GO PCS-58 or GO ATARI16).

Even if you have no immediate use for this issue's code, be sure to take the download anyway; some of the routines will be used in later articles.

In the last installment, we established that resources trees are pointed to by the tree index, and that they are composed of objects which contain pointers onward to other structures. However, we passed

over the issue of linkage among the objects within a tree. It is now time to go back and cure this omission.

The technical term for the linkage scheme of an object tree is a "right-threaded binary tree". If you already know what this is, you can skim over the next few paragraphs. If you happen to have access to a copy of the book "FUNDAMENTAL ALGORITHMS", which is part of the series THE ART OF COMPUTER PROGRAMMING by Donald E. Knuth, you might want to read his excellent discussion of binary trees beginning on page 332.

For the following discussion, you should have a listing of the C image of a resource tree in front of you. For those who do not have the listing from the last column, I have included a fragment at the beginning of the download. Before we begin, I should warn you of one peculiarity of "computer trees": They grow upside-down! That is, when they are diagrammed or described, their root is at the top, and the "leaves" grow downward. You will see this both in the listing, and in the way the following discussion talks about moving through trees.

Each GEM object tree begins at its ROOT object, numbered zero, which is the object pointed at by the tree index. There are three link fields at the beginning of each object. They are called OB_NEXT, OB_HEAD, and OB_TAIL, which is the order in which they appear.

Each of the links is shown as an index relative to the root of the current tree. This means that the link '0' would refer to the root of the tree, while '2' would indicate the object two lines below it. The special link -1 is called NIL, and means that there is no link in the given direction.

Each object, or node, in a tree may have "offspring" or nodes which are nested below it. If it does, then its OB_HEAD will point to its first (or "leftmost") "child", while the OB_TAIL will point to the last ("rightmost") of its offspring. The OB_NEXT pointer links the children together, with the OB_NEXT of the first pointing to the second, and so on, until the OB_NEXT of the last finally points back to its parent, the object at which we started.

Remember that each of these children may in turn have offspring of their own, so that the original "parent" may have a large and complex collection of "descendents".

Let's look at the first tree in the download to see an example of this structure. The very first object is the ROOT. Note that its OB_NEXT is NIL, meaning that there are no more objects in the tree: the ROOT is both the beginning and the end of the tree. In this case, the OB_HEAD is 1 and the OB_TAIL is 3, showing that there are at least two different children.

Following OB_HEAD down to the next line, we can trace through the OB_NEXT links (2, 3, 0) as they lead through a total of three children and back to the ROOT. You will notice that the first two children

have NIL for the OB_HEAD and OB_TAILs, indicating that they have no further offspring.

However, node three, the last child of the ROOT, does have the value 4 for both its OB_HEAD and OB_TAIL. By this we can tell that it has one, and only one, offspring. Sure enough, when we look at node four, we see that its OB_NEXT leads immediately back to node three. Additionally, it has no further offspring because its OB_HEAD and OB_TAIL are NIL.

You will find that object trees are always written out by the Resource Construction Set in "pre-order". (Again, see Knuth if you have a copy.) This means that the ROOT is always written first, then its offspring left to right. This rule is applied recursively, that is, we go down to the next level and write out each of these nodes, then THEIR children left to right, and so on.

For a further example, look at the next tree in rs_object in the download. You will see that the ROOT has an OB_HEAD of 1 and an OB_TAIL of 6, but that it actually has only three offspring (nodes 1, 2 and 6). We see that node 2 itself had children, and applying the rule given above, they were written out before continuing with the next child of the ROOT.

Why was this seemingly complex structure chosen for GEM? The reason has do with the tasks of drawing objects in their proper locations on the screen, and determining which object was "hit" when a mouse click is detected.

To find out how this works, we must look at four more fields found in each object: OB_X, OB_Y, OB_WIDTH, and OB_HEIGHT. These fields are the last four on each line in the sample trees.

Each object in a tree "owns" a rectangle on the screen. These fields define that rectangle. When a resource is stored "outside" the program the fields are in character units, so that an object with OB_WIDTH of 10 and OB_HEIGHT of 2 (for instance) would define a screen area 10 characters wide and 2 high.

When the resource is read into memory with an rsrc_load call, GEM multiplies the appropriate character dimension in pixels into each of these fields. In this way portability is achieved: the same resource file works for any of the ST's three resolutions. Knowing how rsrc_load works, your code should treat these fields as pixel coordinates.

(I have committed one oversimplification above. If an object is not created on a character boundary in the RCS, then the external storage method described will not work. In this case, the lower byte of each rectangle field is used to store the nearest character position, while the upper byte stores the pixel remainder to be added after the character size is multiplied in.)

Non-character-boundary objects may only be created in the "FREE" tree mode of the Resource Construction Set (also called "PANEL" in RCS 2.0). You should use them only in programs which will run in a single ST screen mode, because pixel coordinates are not portable between resolutions.)

The first real secret of object rectangles is that each OB_X and OB_Y is specified RELATIVE to the X and Y coordinate of its parent object within the tree. This is the first property we have seen that is actually "inherited" from level to level within the tree.

The second secret is more subtle: Every object's rectangle must be entirely contained within the rectangle of its parent. This principle goes by the names "bounding rectangles" or "visual hierarchy". We'll see in a moment how useful it is when detecting mouse/object collisions.

HOW GEM DOES IT

Knowing these secrets, and the linkage structure of object trees, we can deduce how a number of the GEM operations must work. For instance, consider objc_offset, which returns the actual screen X and Y of an object. We can see now that simply loading the OB_X and OB_Y fields of the object does not suffice: they only give the offset relative to the parent object. So, objc_offset must BEGIN with these values, and then work its way back up to the ROOT of the tree, adding in the offsets found at each level.

This can be done by following the OB_NEXT links from the chosen object. Whenever OB_NEXT points to an object whose OB_TAIL points right back to the same location, then the new node is another level, or "parent" in the tree, and objc_offset adds its OB_X and OB_Y into the running totals. When OB_NEXT becomes NIL, then the ROOT has been reached and the totals are the values to return. (By the way, remember that the OB_X and OB_Y of the ROOT are undefined until form_center has been called for the tree. They are shown as zeroes in the sample trees.)

We can also figure out objc_draw. It works its way DOWN the tree, drawing each object as it comes to it. It, too, must keep a running X and Y variable, adding in object offsets as it descends tree levels (using OB_HEAD), and subtracting them again as it returns from each level. Since the larger objects are nearer the ROOT, we can now see why they are drawn first, with smaller objects drawn later or "on top of" them.

(If you write an application which needs to move portions of a dialog or screen with respect to each other, you can take advantage of inheritance of screen position in objc_draw. Simply by changing the OB_X and/or OB_Y of an object, you can move it and its entire sub-tree to a new location in the dialog. For instance, changing the coordinates of the parent box of a set of radio buttons will cause all of the buttons to move along with it.)

Objc_draw also gives us an example of the uses of visual hierarchy. Recall that a clipping rectangle is specified when calling objc_draw. At each level of the tree we know that all objects below are contained in the screen rectangle of the current object. If the current rectangle falls completely outside the specified clipping rectangle, we know immediately that we need not draw the object, or any of its descendents! This ability to ignore an entire subtree is called "trivial rejection".

Now it's rather easy to figure out objc_find. It starts out by setting its "object found" variable to NIL. It begins a "walk" through the entire object tree, following OB_HEAD and OB_NEXT links, and keeping a current X and Y, just like objc_draw.

At each node visited, it simply checks to see if the "mouse" X,Y specified in the call are inside the current object's rectangle. If they are, that object becomes the found object, and the tree walk continues with the object's offspring, and then siblings. Notice how this checking of offspring makes sure that a smaller object nested within, i.e., below, a larger object is found correctly.

If the mouse X,Y position is not within the object being checked, then by visual hierarchy it cannot be within any of its offspring, either. Trivial rejection wins again, and the entire sub-tree is skipped! Objc_find moves on to the OB_NEXT of the rejected object.

THOUGHT EXPERIMENTS

Thinking about the objc_find algorithm reveals some information about its performance, and a few tricks we may use in improving the appearance of dialogs and other object trees.

First consider the problem of a dialog which contains many objects. If we lay them all out "side-by-side", then they will all be immediate offspring of the ROOT object. In this situation, the trivial rejection method will gain nothing. The time objc_find takes to complete will vary linearly with the total number of objects. This is called an "Order N" process.

Suppose that instead we broke up the dialog into two areas with invisible boxes, then broke up each of these areas in a like fashion, and so on until we got down to the size of the individual selectable objects. The number of bottom level objects in this scheme is a power of two equal to the depth of the tree. Trivial rejection is used to its fullest in this case. It is called an "Order Log N" process, and is much more efficient for large numbers of objects.

In practice, the speed of the ST will allow you to ignore this distinction for most dialogs and other trees. But if you get into a situation when speed is critical in searching a large tree, remember that nesting objects can improve performance dramatically.

If you have been following closely, you may have also noticed a hole in the visual hierarchy rule. It says that all of a node's

children must lie within its rectangle, but it does NOT guarantee that the children's rectangles will be disjoint, that is, not overlap one another. This peculiarity is the basis of several useful tricks.

First, remember that objc_find always tries to scan the entire tree. That is, it doesn't quit when it finds the first object on the given coordinates. As mentioned above, this normally guarantees that nested objects will be found. Consider, however, what happens when the mouse coordinates are on a point where two or more objects AT THE SAME LEVEL overlap: they will replace one another as the "found object" until objc_find returns with the one which is "last", that is, rightmost in the tree.

This quirk can be used to advantage in a number of cases. Suppose that you have in a dialog an image and a string which you would like to be selected together when either is clicked. Nesting within a common parent achieves nothing in this case. Instead, knowing that form_do must use objc_find, you could use our trick.

You have to know that the Resource Construction Set normally adds objects in a tree left to right, in the order in which you inserted them. You proceed to build the dialog in the following order: insert the image first, the string next, then carefully add an invisible box which is not nested within either, and size it to cover them both. Set the SELECTABLE attribute for the box, and the dialog manager will find it, and invert the whole area, when either the image or string is clicked.

By the way, remember that the SORT option in the RCS will change the order of an object's offspring. If you are going to try this trick, don't use SORT! It will undo all of your careful work.

A TREEWALKER OF OUR OWN

Since the GEM system gets so much mileage out of walking object trees, it seems reasonable that the same method should be useful in application programs. In the download you will find map_tree(). As many LISP veterans might guess from the name, this code will traverse all or part of an object tree, applying a function to each node. It also allows the function to return a true/false value specifying whether the sub-tree below a particular node should be ignored. Let's examine map_tree() in more detail as a final review of object tree structure.

First, look at the parameters. "tree" is the long address of the object tree of interest, as retrieved by rsrc_gaddr. "this" is the node at which to begin the traverse, and "last" is the node at which to terminate.

In most cases, the beginning node will be ROOT, and the final value will be NIL. This will result in the entire tree being traversed. You may use other values, but be sure that you CAN get to "last" from "this" by following tree links! Although map_tree() includes a safety

check to prevent "running off" the tree, you could get some very strange results from incorrect parameters.

The declaration for the final parameter, "routine", makes use of C construct which may be new to some. It is a pointer to a subroutine which returns a WORD as a result.

Map_tree() begins by initializing a temporary variable, tmp1, which is used to store the number of the last node visited. Since no node will follow itself, setting tmp1 to the starting node is safe.

The main loop of the routine simply repeats visiting a new node until the last value is reached, or the safety check for end of tree is satisfied.

At any node visited, we can be in one of two conditions. Either we are at a node which is "new", that is, not previously visited, or else we are returning to a parent node which has already been processed. We can detect the latter condition by comparing the last node visited (tmp1) with the OB_TAIL pointer of the current node. If the node is "old", it is not processed a second time, we simply update tmp1 and continue.

If the node is new, we call "routine" to process it, sending the tree address and object number as parameters. If a FALSE is returned, we will ignore any subtree below this node. On a TRUE return, we load up the OB_HEAD pointer and follow it if a subtree exists. (If you don't care about rejecting subtrees, simply remove the if condition.) Finally, if the new node had no subtree, or was rejected by "routine", we follow along its OB_NEXT link to the next node.

A simple application of our new tool shows its power. From a previous column you may recall the tedium of deselecting every button inside a dialog after it was completed. Using map_tree(), you can deselect EVERY OBJECT in the tree by using map_tree(tree, ROOT, NIL, desel_obj); You must use a slightly modified version of desel_obj() (included in the download) which always returns TRUE. Be sure to define or declare desel_obj() in your code BEFORE making the map_tree call!

In future columns, I will return to map_tree() and show how it can be used for advanced techniques such as animated dialogs. In the meantime, experiment and enjoy!

The BEAT Goes On
================

by T."Rex" Reade

Who are Alan Pratt, Roy Good and Shiraz Shivji? What do they all have in common and how do they effect us?

We have all seen these names in print at one time or another but have we ever really known who or what these guys do?

Alan Pratt works for Atari .
---------- He programs for them and is largely responsible for working on Tos.

Roy Good (who just loves Unix) works for Atari.
-------- He is the "main man" in software programming, "The Boss".

Shiraz Shivji (The Father of The ST)
------------- works for Atari and is a hardware WIZARD. Shiraz relies on Roy Good for the software goodies for the ST.

I made a different lead in to give you an opportunity to have an idea about why there is another bruhaha brewing at Atari.....

We all know the 68000 chip is really not designed for multi tasking and on this matter we should all agree...but by this time we have all heard about the "new" cousins to the 68000 chip.

68020 - 68030 - 68050

Did you know that TOS was rewritten for the 68030? Did you also know the 68030 was designed especially for multi-tasking. The facts are.... from a VERY reliable source, that Roy Good, has seen to it that this "new version" of TOS does not support multi-tasking either! How incredibly lame can they get. We know he simply loves Unix and would be overjoyed if TOS died a slow and horrible death by attrition.

Consider this ....there are many folks who enjoy using TOS and want to continue using TOS. These people are PAYING customers and deserve to have ALL the features TOS is capable of delivering. THAT INCLUDES MULTI-TASKING and contemporary accessing of ALL peripherals. 16mb per partition is from the ICE AGE!

Perhaps the next candidate for the revolving door is already headed that way.....to have Mr. Shivji rely upon Roy Good for sound software advice and then see that the new TOS for the 68030 has NO MULTI-TASKING is, without a doubt, another point blank foot shot! It would appear that Mr. Good (yes, the guy who has been making all the fancy releases about TOS 1.4), has dropped the ball on this one.

Rex......

5799. COBOL-compiler

Newsgroup: comp.sys.atari.st
Date: 1988-10-01 03:07:12 UTC
From: chris@neabbs.UUCP
Message-ID: <38466@neabbs.UUCP>
Source record: 250499

Hello world!

I've been looking for a COBOL-compiler (stop laughing) for quite a
while
now, but it seems no software-company is interested in making
such a compiler.
Has anyone heard of such a compiler on the market? (Has anyone heard
of COBOL at all in this newsgroup?)
I'm very interested, because there are several sources of usefull
programs lying around here.

Chris
(an aging programmer who still understands the ancient COBOL-language)

I have been thinking about getting an Atari 1040ST, so I want to ask a few questions. Any reply is appreciated.

1. What is Meag St anyway? What's the price range?
2. What's the difference between Atari 1040St and Mega St?
3. Which one is a better buy, and why?
4. I have hear about the accelerator cpu (a new and faster cpu), can anyone tell me more about it? I also need the price tag too.
5. What about the Mac Plus cartridge? How compatiable is it (in %)? any comment on it? What's the price?

THNAKS!!!!! in advance for any comment.

From: hmm@laura.UUCP
Message-ID: <644@laura.UUCP>
Source record: 250351

In article <803@cacilj.UUCP> paul@cacilj.UUCP (Paul Close) writes:
>Question: why are all the boards for 2.5 or 4 meg? As I understand it, the
>ST can have 2 banks of memory. I have a 1040, so that's one bank with one
>meg. If I add 1 meg on the other bank, that's 2 meg (just like the mega-2).
>Where, then, do the 2.5 meg boards come in?

Due to the sizes of memory chips (256K*1, 1024K*1) and the number of memory
chips required for one bank (16), one bank has either 0.5 or 2 Megabyte.
So the 1040 has 2 banks of 0.5 each, the Mega 2 has just 1 bank of 2 meg.
The options for upgrading a 1040 are therefore:
1. rip out one bank, make it 2 meg, get 2.5 meg total
2. rip out both banks, make them both 2 meg, get 4 meg total

> Has anyone heard of such a compiler on the market? (Has anyone heard
> of COBOL at all in this newsgroup?)

If you care THAT much about it, you should be able to use an IBM PC compiler (Utah COBOL, frequently advertised in thick magazines, comes to mind) with PC-ditto. Of course, what you'd get out would be PC programs which would still have to be run under PC-ditto. This leads to the idea that you might want to find out if the p-system (UCSD Pascal, that stuff: I forget the name of the company that handles it now---something cute like Peachtree) includes a COBOL compiler.
Anyhow, if you get a compiler from COBOL to pseudo-assembler that runs under PC-ditto, that leaves you to implement the pseudo-machine on the ST. You might even enjoy doing it. You might even be able to sell it.

5807. Where do you go from GFA Basic?

Newsgroup: comp.sys.atari.st
Date: 1988-10-02 23:53:00 UTC
From: Friesen@PCO-MULTICS.HBI.HONEYWELL.COM
Message-ID: <881002235307.544734@PCO-MULTICS.HBI.HONEYWELL.COM>
Source record: 250357

Hi all

Ever since I purchased my ST (over a year ago), I've been programming with GFA Basic. It's a really good language, easy to program, fast, etc. However, I feel that I'm outgrowing it. I often program video games, and GFA Basic just dosn't seem to have the power or the speed to make a fast action arcade game. I will see how much speed increase you get with the new version, but I don't think it will do it. What I would like in a language is:

1. Fairly easy graphic support for games

2. Fast execution of graphics (this is where GFA Basic falls short)

3. Very powerful use of GEM, I/O, and graphics

I'm not sure what language is best for this. I know that the assembly language is the fastest, but I really don't want to learn it. I am learning Pascal, and am planning in a year or two on learning C. I'd rather stick with one of these two. Can anyone reccomend a package for me?

Thanks in advance.

5809. 9600 color CAD animation package!?!?!

Newsgroup: comp.sys.atari.st
Date: 1988-10-02 23:56:00 UTC
From: Friesen@PCO-MULTICS.HBI.HONEYWELL.COM
Message-ID: <881002235649.240064@PCO-MULTICS.HBI.HONEYWELL.COM>
Source record: 250359

According to a newsletter I just got from Mitchron/Microdeal (the makers of GFA Basic), they have just released a CAD package similar to CAD 3-D by Antic. It has some interesting features, such as ray tracing, a language similar to cyber control for moving objects, but most imprtantly, it can display 9600 colors!!!

If anyone has any info on this package, I would greatly appreciate it. I was planning on going out and buying Cyber Control, Cyber Sculpt, and Cyber Texture in a few weeks, but before I invest any more money into Cyber Studio, I would like to find out about this new package.

If I get anything interesting, I'll summerize to the net.

I am soon going to be scrapping my XT clone and getting a ST. However, I'm not too sure of what setup is best, and could use some of the net's expert advice. What hardware/software setup would you recommend, or are happily using right now? IE: 1040/Mega? Mono/Color? Etc.. I intend to use this system as a tool for school and programming, ie. games are a distant second. Please E-MAIL me your suggestions.

--Jonathan

PS. I am aware that this is probably the (e**n)th time that this has been asked, so hopefully someone has an archive file containing the answers to these questions. If not, I'll build one from the responses I get.

5812. Re: Memory expansion

Newsgroup: comp.sys.atari.st
Date: 1988-10-03 10:02:21 UTC
From: alfred@dutesta.UUCP
Message-ID: <1208@dutesta.UUCP>
Source record: 250362

The 1040ST has indeed 2 banks of memory. Each bank has 512K DRAM in it.
To expand your memory de-activate one bank (512K) and then you can add 2M.
This gives you 2.5 Mb of memory. If you de-activate the other half as well, and
put 2Mb back in it then you have 4Mb of memory!!. That's easy, isn't it. The
only problem is that 1Mb chip are a bit expensive here.
Each bank used in the 1040ST can, if my memory banks are operating at the moment (monday
morning), have 128K, 512K or 2Mb of RAM. This is probably restricted by
the MMU.

5813. ccprint improvements

Newsgroup: comp.sys.atari.st
Date: 1988-10-03 11:54:57 UTC
From: mike@ncrcpx.UUCP
Message-ID: <1821755@ncrcpx.UUCP>
Source record: 250363

Some time ago I got a program called ccprint from the atari binaries group. It appears to be a very nice program. I do have one small problem with it. I have an Epsom FX-85 printer and when I use ccprint, there is no form feed between the pages. This would be one really nice program if it would. Am I doing something wrong ? Yes, I selected the skip perforations option.

Is there any chance of getting the source for this program? I wouldlike to play around with it myself.

thanks for your time,

mike

5814. VT52 Emulation ..

Newsgroup: comp.sys.atari.st
Date: 1988-10-03 12:57:32 UTC
From: Hugh_Messenger.EuroPARC@Xerox.COM
Message-ID: <881003-055901-3134@Xerox>
Source record: 250364

Hi,

I've only just subscribed to Info-Atari16, so no flames if this is an old, old question ..

I'm having hassle with the VT52 emulator DA. I use a Dowty Quattro modem, talking at 2400, 7 bits, one stop bit, even parity, flow control on, full duplex. As I am currently only using it to read my email from home, I'm not using any comms packages, just the emulator. It is running on a Mega ST4.

It all works just fine for a while, then the Atari seems to to chuck out a massively long string of nuls (^@'s), interspersed with everything I have typed so far in the session. Once it finishes outputting everything I have typed (including my password in legible format!) it carries on working just fine, for a few minutes, then .... you guessed it ...
^@1itscambsitshippo********yyy12,45,67nnn^@^@^@^@
[etc etc etc].

I am fairly sure that the Atari is responsible for the spurious crap, as the TX light on the modem is lit while the above is happening.

Another slight annoyance is that when I log in to any Un*x systems (most often a Sun 3/140 running SunOs 3.4), the terminal type is not recognised and defaults to DM2500. set term=vt52 works OK, but surely the emulation should answer Un*x's request for terminal identification? Or is SunOs getting it wrong, after all, we all know what terrible machines Suns are :-)

Any suggestions, answers, hints, gratuitous insults etc gratefully received.

5815. SLM804's, ASSIGN.SYS, etc

Newsgroup: comp.sys.atari.st
Date: 1988-10-03 13:36:18 UTC
From: Hugh_Messenger.EuroPARC@Xerox.COM
Message-ID: <881003-063651-3167@Xerox>
Source record: 250365

I'm busy trying to sort things out having just taken delivery of a Triangle 40Mb hard disk and an SLM804 laser printer. My main problem seems to be with ASSIGN.SYS files. At the moment, if I want to run (say) Timeworks DTP after having run Easydraw, I have to fart about renaming the various assign.sys files on the root directory of drive C and then reboot. Hardly satisfactory.

I have tried combining the two assign.sys files, but whichever way I try it one of the applications barfs and complains about not being able to find its font files. My general approach is to put *all* font files and drivers into one directory, set the path correctly in the 'master' assign.sys, then for each device make a list of all fonts specified in the various assign.sys files of the applications I need. The problem with Timeworks DTP and Easydraw appears to be that they have different names for the same device number .. ? As I have no documentation whatsoever on GEM, I'm kind of blundering about in the dark. Speaking of which, can anyone recommend any GEM documentation?

If anyone out there has an SLM804 and has managed to sort out some sort of working assign.sys, I'd be very glad to hear from them.

Oh, while I'm here, another question. Is there such a thing as a Postscript driver/emulator for the SLM804, ie. something that will let me print Postscript files as if the SLM804 was a Postscript printer? OK, so considering who I work for I should be asking for an Interpress driver, but ..

5819. GEM programming

Newsgroup: comp.sys.atari.st
Date: 1988-10-03 16:48:23 UTC
From: pa1132@sdcc15.UUCP
Message-ID: <586@sdcc15.UUCP>
Source record: 250369

Here is some questions about GEM:

1. Why is the number of windows limited to 8? Why did DRI design this way? With a miminum of 512k memory for the ST, memory shouldn't be a problem. Even on the earliest 128k Mac, there is no limit on number of windows you can have on the screen. Is there any way to modify the AES so we can get rid of the memory limitation?

2. How to get the menus to appear on other parts of the screen instead of the top line of the screen? I have seen some desk accs to have menu bar under their window title bar. How is that done?

3. How to get bottons, editable (spelling?) text fields and other objects, that used to appear in dialog boxes, to appear in a window?
4. How to modify the appearance of windows? For example, in PageMaker for the Mac, icons are added to the border of windows to show the current page. Is that kind of trick possible under GEM?

PageMaker is a trademark.

> Consider me out of it for the past five years, but.....
>
> Can you run the new Spectre 128 on an old 520 ST or STFM?

The Spectre 128 runs on any ST (old, new, Mega, non-Mega). The only thing that changes is the amount of RAM available to the Mac. On a 520 ST you can only emulate a 128 or 256K Mac, which is a fairly limited system. If you really want to run Mac software you need at least a 1 Meg ST (upgraded 520, 1040, whatever), that gives you enough RAM to run almost all Mac programs including HyperCard. I don't know of any Mac programs, other than one compiler, that won't run in the 832K the Spectre gives you on a 1 Meg ST.

5824. TeX distribution from clio (35.195.16.4)

Newsgroup: comp.sys.atari.st
Date: 1988-10-04 01:37:27 UTC
From: schell@iris.ucdavis.edu
Message-ID: <3143@ucdavis.ucdavis.edu>
Source record: 250374

HI, y'all. I just downloaded the ST version of TEX from the ftp server at clio (35.195.16.4). After getting lplain.tex, hyphen.tex, lfonts.tex, and latex.tex (plus about 47 .tfm files) from my local un*x machine, I ran the INITEX.TTP program to produce LPLAIN.FMT. Everything goes fine until it hits the end of all the input files at which time it prints '*' prompt on my screen and waits for me to type something. I've tried '\bye', '\end', '\dump', all to no avail. It either doesn't understand my command or complains of stack overflow.

Question: what do I type in response to the final prompt?

Another ?: has anyone successfully built an LPLAIN.FMT this way on a 1Meg 1040ST ?

Help me, please.

Thanks.

Source record: 250375

I was very disgusted about the October issue of Antic. For one thing, they gave a review of the game Obliterator, and it was obvious that they hadn't played it, they had only read the instruction book. But even mor annoying was an article on page 27. It is supposed to be a stock analasis of Atari by some analyst named Isgur. Basically what the article says is the types of things Atari has stopped saying. He says Atari by this fall Atari will release a 68030 based machine as well as a laptop with a built in hard drive. He says that in January Atari will introduce their first 68000 game machine. He says the Atari transputers should be on sale before the end of the year. I do think this sounds interesting, but I just cannot believe any of it. This all sounds like the kind of thing Atari stopped doing. I guess stock analysts are going to fill the void of rumor hungry people!

I am in the process of programming an all resolution painting program in GFA Basic, and I decided to put in a routine to show you how much free disk space you have on a disk. I ran the procedure and it said that I had 0K available, but only 622367 of the 720000+Bytes were used. I used the show info. option on the desktop and got the same results. What does this mean? Can it be corrected?

Thanks in advance

Source record: 250377

I just logged on Genie, and noticed a new PD game in the ST library that sounded good. It was the file ROCM.ARC. I unarced it to find that Thomas Stoker (the programmer) definatly deserves a compliment! This is about the best game I've seen on the ST (PD or pay). It has great graphics, good story, and is hard but not immpossable (I improve everytime I play). This is one shareware program that I am definitly going to send in my $5 for!

PS I'm not being mean, but don't ask me to send this to you, because I the mainframe I bounce my 'stuff' off of dosn't support binary transfers.

Everyone wants a program that will do it, well here it is:

********** * * * PINBALL FACTORY * * BY: * * MITCHRON *
****

It uses a wierd forrmat (it always makes weird noises on my floppy) for copy protection. If you try to save a pinball game you have made to the original disk whether it is write protected or not, it won't save the whole thing, but part of it will be saved. The only way you (or at least I) can save a game, is if you save it to another disk.

5829. Where's the message?

Newsgroup: comp.sys.atari.st
Date: 1988-10-04 01:57:00 UTC
From: Friesen@PCO-MULTICS.HBI.HONEYWELL.COM
Message-ID: <881004015706.271647@PCO-MULTICS.HBI.HONEYWELL.COM>
Source record: 250379

How come I never see the messages that I post, but other people do, because I get replies to them. Also, it seems that I miss other messages, because I'll see a relply to a message that I never saw the original to. I really don't pay attention to the volume number, so I may be missing whole volumes.

Any help is appreciated

ST Report and ZMAG are copyrighted publications, not true public domain.
However, the folks at ApeInc allow it to be distributed freely, provided
that it is distributed in its original form. Therefore, you may edit out
the ads if you wish, but it is illegal to distribute it after editing it.
I hope that ApeInc keeps the ads to a minimum, but I really have no say in
the matter. If there is excesive complaint about the ads, I can stop posting
them. It is up to you.

>
>Here is some questions about GEM:

I suspect that someone more experienced will answer, but here's what
I know on the topic (not much!)

>
> [stuff deleted]
> Is there any way to modify the AES so we can get rid of the memory
> limitation?
>

Atari might be able to do that, but who knows. Haven't heard them say
the limit was raised in TOS 1.4. If you have too many windows things
get very cluttered anyway. This isn't a Sun with space for 4 or 5 big
windows on the screen at once.

> 2. How to get the menus to appear on other parts of the screen
> instead of the top line of the screen? I have seen some desk accs
> to have menu bar under their window title bar. How is that done?
>

You'd have to write your own menu handling routines. The standard ones
are easy to use, but limited.

> 3. How to get bottons, editable (spelling?) text fields and other
> objects, that used to appear in dialog boxes, to appear in a window?

You can write your own dialog handler and integrate it with code to
handle it being in a window (redrawing it, moving, sizing, etc.) Tim
Oren's ProGEM columns provide an alternate dialog handler which would
make a good start. This is also the only way to provide non-modal
dialogs, which are nice in a lot of situations.

> 4. How to modify the appearance of windows? For example, in
> PageMaker for the Mac, icons are added to the border of windows to
> show the current page. Is that kind of trick possible under GEM?

Laser C does this but I'm not sure how. I assume that they simply open
a window and draw the border elements themselves. When the mouse is in
the window, they essentially operate the window and border elements
like a big dialogue and internally generate messages for arrows being
clicked on, etc.

You could try to trick GEM by, for example, drawing the page number inside
of the vertical slider box each time you reposition it. However, you'd

have to be very careful to make sure that GEM never erases it without
it being redrawn.

>
> PageMaker is a trademark.

yawn.

I'm not going to venture a guess on DRI's motives for the window-limitations, but I suspect that it was probably easier to code :-) Does anybody know whether the REAL GEM (the one that is still supported by DRI -- not Atari's version) has this limitation?

About putting buttons, editable strings, etc. in Windows (instead of Dialog boxes): When I wrote a calculator program, I created a Dialog box with all these objects. In my program, I created a window with dimensions set to the width and height of that dialog box. Then I displayed the dialog box inside the window (and redrew it whenever a redraw-event happened.) The toughtest part was getting the dialog box to appear in places OTHER than the center, since that is where these boxes appear by default.
This was done by accessing the dialog-boxes data-structure (and I think that was a kludge.)

Hope this helps a bit.....BTW, I think this method (of accessing the object's data-structure directly) might also work for menus -- but I could (and probably am) wrong.

Message-ID: <881004-002919-2478@Xerox>
Source record: 250384

Here is a thought for the people who are having digestive problems

consuming all those digest . Would it be nice if we had a program

that:

would display all subjects on the screen

allow for selection of each piece of mail

allow for adding this mail to files covering the topic/subject

deleting the mail from both the digest

deleting the processed digest(s)

all also applicable to the topic/subject files

I would like to create a program like that assuming that

it does not exists already (life is too short). Any constructive

ideas are welcome!

>

If it were that simple I wouldn't have asked. For your information:
CD players were available in Europe before they could be bought in the US.

The best theory I have heard thusfar is:
Americans want to have something they can show off with, even when it means
that their everyday comfort is less. Europeans place everyday comfort higher
on their list.
It still doesn't sound convincing.

COMP-U-SERVE ~ GENIE ~ DELPHI ~ THE SOURCE
=========================================================================

From the Editor's Desk,

Having had the time to ponder the course of current events I find
many reasons to rejoice in the changes coming about in the Atari Corp.
and it's methods of dealing with the US Userbase.....In fact, I HOPE that
they will soon have the Federated, or whatever name they care to use,
stores all over the country and eliminate the goniffs they have now for
dealers.

Granted, not all the dealers are bad guys but, at this point in time
with all the doomsayers in full bloom the average "I got my life savings
tied up here" dealers are going to react unfavorably and thus "score" for
```

every buck they can. This type of situation warrants Atari to get the national chain into full swing ASAP. To the doomsayers I say...you folks are pure bad news unto yourselves and are doing more harm to the Atari Userbase than any good you can possibly imagine. The time is at hand to stand by the machine and company we have embraced, changes are being made.

We were extremely vocal in gaining the attention of Atari and we did so. Now, with Atari being responsive to our input, we stand ready to accept the changes we have clamored for. We dont expect total alignment with the userbase suggestions. We do however, expect some similarities. After all, we ARE the ones paying the bills (collectively) and should be heard and responded to..and we have been. Atari is on a course of corrective measures that can only lead to true and lasting success.

Having heard that certain members of the Harris types of online folks from Atari had a "mini" conference a day or so ago with one of the doomsayers amazed me. It would seem rather foolish to add fuel to the fires of those that say, "THE ST IS DEAD" ! To insinuate that Atari will have little or NOTHING to show at Comdex is truly a hypocrisy of the word loyalty to one's employer! In addition, it is just plain vile to perpetrate such acts while ONLINE representing ATARI!! That particular department needs further adjustments.

Long Live Atari,

Rex.....

SPECIAL SUPRA MODEM OFFER!!!
==========

CompuServe's Atari Forums have made very special arrangements with
Paramount Products Inc. to offer the members of our forums the chance to
upgrade your system to 2400 baud service at a very special price.

For a limited time, CompuServe subscribers may purchase the

SUPRA CORP. 2400 baud Hayes-compatible modem
for the very **LOW** price of just $139.95 !!!!!

These are brand new, not reconditioned units, with the full SUPRA CORP.
warranty. The SUPRA MODEM uses the Hayes Smartmodem 'AT' command set and
operates at 300-1200-2400 baud. It's an outboard unit (not an internal
plug-in card) allowing ease of transfer to other computers.
Connection is thru the standard RS-232 interface. (Just plug it into the
back of your ATARI ST).

To take advantage of this special offer, Phone the 800 number
listed below or write to:

Paramount Products Inc.
1405 S.E. Pacific Blvd.
Albany, Oregon 97321

***** Phone orders: (800)444-4061 *****

Price: $139.95 + shipping
UPS ground: add $4.00
UPS Blue label: add $8.00
C.O.D.: add $2.25

MasterCard or VISA accepted Orders will be shipped the next business day

If you've been accessing CompuServe at 1200 baud, this is a great way
to lower your total online bill since CIS does *NOT* charge a premium for
2400 baud access. (You can get the same amount of information or download
the same amount of programs in approximately 1/2 the time as 1200 baud
users!) This modem will PAY FOR ITSELF in just a few sessions.

THE SKY IS FALLING!
==========

****

NOTE:

This is Dave Small's response to the announcement by Neil Harris
that he has resigned from Atari. For those who don't know Dave he is the
developer of the Magic Sac and Spectre 128: devices that emulate the
Macintosh computer on the Atari ST.

****

This is really stunning.

If you think this is just another "Atari employee splits" note, consider:

1) Neil was the spearhead of Atari online. Here, Genie, Usenet, Delphi, you would find Neil. The support other than Neil has been fragmented to be charitable. (Due credit goes to Julius, though). Given the power of the online networks for marketing, and Atari's upper management completely missing that, this is big trouble.

2) Unless I am much mistaken, I'll guess Neil had Atari stock options. What does it tell you that he's leaving? I don't know how Atari stock could drop more (it's down to 6), but there's always a way. Maybe they can "unsplit" stock to get it back to 12, *grin*. This means Atari is in big trouble.

3) Neil is the *only* effective public speaker Atari had. Atari did manage to waste much of it by forcing him to go say things that weren't so, or were only a little bit true. Neil gave innumerable talks and presentations to user groups at shows across the country. Just who is going to replace him? You don't find people like that easily, or sometimes, at all -- look at the number of corporations who have *no one* like that. This means Atari is in big trouble.

4) This happened right before the "big" CO here online with Sam. Big trouble.

5) This happened right before Comdex. Big, big, big trouble. Neil was one of the few people in an autocratic, 1950's-style management office that had any feel at all for reality. Now, what are we going to get? A repackaged ST game machine with a laser tag pistol? A VCS / ST? You can bet that when it appears (if) at Comdex, there will be ghostly vapor surrounding it, the signal of a product not to appear for another year. Big, big trouble.

6) Atari has no grasp of the current US marketing situation; you can't stop support the instant the customer walks out the door with their ST and you cash their check. Atari tries to do that, of course. I remember well Alex Leavens getting canned for daring to support people who hadn't bought the developer's kit (among other peccadillios). "Business is war", when the people you are warring on are your *customers*, is dumb. We are in a service economy now; people expect *service*.

No? Atari top management held up release of the auto hard disk booter for a LONG time, claiming it would "cause a lot of tech support calls". The author, one Landon Dyer, is now at Apple, disgusted with Atari. He *wrote* most of the ST's BIOS; losing a lore-master like that is always very painful for a company.

7) Neil Harris has been with Jack T. a *long* time. What does it tell you that he's bailing out now? Do you think he would if he saw any hope of things changing? Do you think he'd go through the shock of job loss, moving, new company, etc, if he saw any chance at all? *Neil is not stupid*. Atari made him say stupid things, and folks like ST-Report interpret that to mean Neil is stupid. Wrongo.

8) John Skruch -- whose word I trusted, a rarity at Atari -- is gone. Sandi Austin, who did those user group shows (remember?) is gone. Richard Frick, who was *instrumental* in getting the Magic Sac going, only to watch Atari's top management cold-shoulder it (Quote: "Why would anyone want to run Mac software when they have TOS?"), is gone. They've all left Atari recently.

9) Just who is going to get Atari publicity from folks like Jerry Pournelle anymore? Neil sold a lot of Ataris that way, and made the Tramiel people a lot of money.

10) Is it possible that Neil feels he's getting out before his reputation is ruined by an Atari crash? Already it's been damaged by things he had to say (Atari corporate policy).

11) The Comdex timing is especially significant. If Neil saw a future at Atari, it would be new products announced at Comdex. I have heard from other sources that Atari's top level management is now backing off from introducing ANYTHING new or interesting at Comdex -- wouldn't want to distract people from the ST, folks. Quote: "Atari's domestic market is Europe. The US is Atari's international market". Unquote. This makes Comdex look like a splash to me -- much like the May one, in the Abandoned Booth.

12) It says a LOT to me about working conditions at Atari that even Neil,
who is pretty tough and good at political infighting, is leaving. If you've never seen a 1950's style autocracy, well, check it out. It is hard to stand (look at the number of people Atari has gone through at top management), clearly. Other companies don't tax their personnel like this; they realize that this is not the 1950's anymore, people are scarce and hard to find, and need to be *part of the company*, not just some slave-employee. Many other reports of working conditions at Atari make it sound like hell to work at.

13) If Neil doesn't think there's going to be profit in his stock options, you ought to be thinking about it too. (Again, this is a guess). It is possible that Atari is folding up; the collapse will just take awhile to reach the public.

14) Most ST developers are seriously considering jumping ship; a lot already have. Even Tom Hudson, arguably the best, is gone. Given how little Atari supports its developers (something Neil fought for) and gives online support (ditto), and that it could care less about selling into the US, it seems a waste of time to develop for the ST for the US market, when there's markets like Amiga, IBM, and Mac to develop for -- who have good documentation, people who aren't propeller-hat-heads online, and so on.

15) I think this marks the end of Atari US. The Spectre 128 is almost certainly my last ST product.

Dave Small

Fm: Neil 70007,1135
To: David and Sandy Small 76606,666 (X)

I refuse to allow my departure to be used as evidence for such a gloomy scenario for Atari, even by someone I like as much as you, Dave.

Yes, I passed on some stock. But not nearly enough to qualify me for the "golden handcuffs" club that binds some of the vp level and above.

To address a couple of minor points, John Skruch is most certainly not gone. He seems to be doing very well -- with the success of Atari video games, members of that division are being treated decently.

And as for Alex Leavens -- it was *my* call, period. He spent a fair amount of time online, which was good. But he did not spend enough time on the rest of his job with the tech support group, and that was why I brought him in. It was painful to have to let him go, but that's the price you pay when you're in management.

Yes, I share some of the concerns you expressed. Mainly I am concerned for my coworkers at Atari who are underappreciated and underutilized.

There is also some concern over product directions, but it ain't over until it's over, and that isn't quite yet.

Finally, for the record, I take with me a fair amount of Atari stock, which I have no immediate plans to sell.

--->Neil

THE BEAT GOES ON
==========

by T."Rex" Reade

AN APOLOGY FROM REX!

Having been given a line of seemingly credible information from a very credible source within Atari, I now apologize to all concerned for the information contained in the ST Report 54 article "The Beat Goes On". There absolutely WILL be multi-tasking in the 68030 series of ST machines. I doubt I will receive any further erroneous info from this person as they are no longer with Atari.

It is very difficult to disagree with a people you know and respect, but..

To credit ST Report with having caused the demise of certain Atari employees is wild. Actually, to those who would say these things, we say thanks ....but NO THANKS for such flattery.

We are flattered to see that one of the so-called leaders of the Atari community feels we wield such power. I find it equally amazing to

see this particular item attempt to portray the idea that it is composed of FACTS... it is NOT!...frankly speaking, this item by Dave Small is ...

HIS OPINION and HIS OPINION ONLY!

We all know the joke about opinions.....right? , <<<Big Grin>>>

All the crepe hanging going on is about to turn my stomach! Atari is NOT going anywhere but on the sales and service improvement path. To pointedly say, (as if armed with facts and figures), that the days of Atari are "numbered" is a slanderous misrepresentation. A "better" way of expressing this is..the days are "numbered" for certain detrimental individuals in Atari's Employ.

To the respected members of the Atari Community I plead with you.. "TAKE DOWN THE PURPLE AND BLACK FLAGS there is no death of anything that we must take notice of. Besides, there really are those of us who wish to continue to support Atari and it's future. We may be critical towards Atari at times but let me tell you this; We will support Atari until such time that either they or us are no longer a viable enterprise.

Speaking of Atari needing to get the rest of it's "outspoken" employees in line.....how about Mike Dendo, the new Vice President in charge of Computer Sales, going to Michigan, telling the good folks there that Atari had three soft quarters this year and that they needed the fourth to be a huge success to "bail out"!!??? What is this guy? He certainly is NOT an accomplished salesman let alone a VICE PRESIDENT! Maybe he works for the other competition! This bird needs to hit the revolving door! Also, the online folks need to concern themselves ONLY with what they are there for, (representing Atari) stay out of politics, personalities and endorsements of "other" related products for the ST that are not manufactured by Atari. There is NO need to resurrect certain practices Neil took with him.

In addition;

ALEX LEAVENS...was encouraged to leave because of his spending too much time "online" and not enough time at his assigned duties.

John Skrutch has NEVER left Atari, in fact, his division is having a very good year.....
Furthermore, anyone who attended the SPRING COMDEX will recall the fact that Neil Harris, *** ex-ATARI SPOKESMAN *** spent the best part of the time there online playing Games!!!! AND....when he was away from the cpu, he left FLASH booted and the system online (he has a system wide free flag) so no other person would attempt to use the computer. I saw this as did a host of others. In my humble opinion, the handwriting was already on the wall.....Neil didn't really care anymore at that time and his departure from Atari would soon be forthcoming. I am NOT putting Neil down, I AM saying he did the right thing in making a career change before his depressed attitude caused him severe personal problems.

In conclusion, because of the recent shakeups at Atari, I am lead to
believe that the bosses and most of all, Sam Tramiel, are bent on making
the U.S. Marketplace Atari's best success story. If such is not the case,
then it would be wise to say ...."they had better go underground" because
a lot of "not so wealthy" people tied up some "big" bucks in the Atari
Dream.....Personally, I feel all is well in Sunnyvale, and we still
haven't seen the end of the major changes in staff or in policy. Besides,
Mega 4s and Laser printers make terrible hats!

Rex.......

HARD DISK FACTS AND FIGURES
==========

The Straight Info!

To begin, 99% of all hard disks are made to conform to IBM standards. With
this thought in mind we shall proceed.....

The most readily available and in my opinion, the most reliable hard disk
is from Seagate......next in line is the Miniscribe. There are
others but you must make sure they conform to the IBM standard.

IBM STANDARD: ST-506/ST-412

Most commonly found hard drives do not have controllers built in. These
are the most reliable and economical drives to use.

WHAT IS THE CONTROLLER???
==========
This goodie is the custodian of your hard disk! It directs all I/O
functions to the hard disk and it points to and accesses each cylinder.
It "controls" everything.

Be Advised, as of 01/01/88, Seagate began using the new I'ntl light code,
the front light on the drive is GREEN ONLY if it is made after Jan.01 1988.
If you purchase one and the light on the front is red, it's either old
inventory, used or rebuilt. I do not advise the use of the "N" type H/D,
they're limited in their flexibility of use by the embedded controller and
are more expensive. Seagate may cost more, but they are the workhorses of
the industry. The Seagate Hard Disk is extremely RELIABLE. Seagate units
40mb, and above, have auto-park.

All of the above are:FCC,TUV/UL/CSA [CERTIFIED]

The list of other types of drives is large, some are, Disctron, Lapine,
Microscience, Micro-memories, Miniscribe, Priam, Rodime, Shugart, Tandon
and Tulin. The formatted size of these range anywhere from 5-???Mb.

I purposely avoided Brand Names of packaged drives because in most
cases they use Adaptek and Seagate or Miniscribe...I have found that
Atari and Supra have gone to the 3.5 hard disk. I will cover those next
time. As far as Atari is concerned, they would have saved a fortune in
R&D if they had used the standard assembly, as the method they used is so
typical of Atari, "they walked all 'round the barn to walk in the front
door", why did they have to change the 'prom, it made the SH204 a problem
maker, why the dip switches?,,do they really think the Atari user cant
```

handle Terminal resistor packs and jumpers??? Bad Move! Some of the companies have gone to Miniscribe, (the coffee grinder) to cut production costs, they will go back to SEAGATE as soon as they realize the RMA numbers are eating their lunch!

Remember that all these drives (except for a few) come without a controller, you really want it without a controller..it's less expensive and works out much better for you in the long run.....you will see!

The actual chain of connection for a hard drive is:

1-hard disk
2-controller
3-interface..and the DMA port.

MFM- This is a format style most commonly found in use although recently, RLL has been becoming far more popular as it is a condensed compact format thus allowing more data to be stored on an equivalent size hard disk. The major difference is the media itself in the hard disk is PLATED to insure accuracy and longevity. Think of it like plain recording tape and Cr02 Chromium Dioxide tape. The recording media in the "R" drives (Seagate) is of a high quality and plated.

In most cases, the Interface, (Host Adapter) determines what type of system the hard disk will comply with. It also (usually) has a clock/ calendar built in.

In reality you can take a hard drive system made for an 8bit XL/XE and change the interface to one for an ST and it will now work on the ST (after a format).

The two most widely used controllers, and I might add, ARE REALLY THE BEST, are made by Adaptek they are designed with the user in mind and provide for expansion for the future.

ADAPTEK 4000 SERIES CONTROLLERS

ACB-4000A ACB-4070
--- ---
Interface SCSI dr type ST506/412 ST506/412 [RLL-Certified]

While Adaptek does offer other controllers, the 4000 series seem to be the most reliable. Note: the 4070 does require sheilding when mounted close to the drive.

These hard disk systems are special in one way, they have embedded controllers.
IOMEGA

ALPHA 10H BETA XXX interface

XEBEC

1410 1410A interface
SASI dr type ST506/412 ST506/412

* These devices are SASI and are slowly fading into the sunset......

ADAPTEK CONTROLLERS
===================
ACB4000A / ACB4070 are highly recomended and of excellent design. These
controllers will handle most any application.

HARD DISK INTERFACE
===================
There are three types available for the ST: ICD, Supra, and Berkley

THE ICD ST HOST ADAPTER INTERFACE
=================================
The Host Adapter is designed for the 16 bit ST hard drive system or for
most anything you care to couple to it...ie, tape backup and hard disk
and laser printer etc..

The host adapter interface is also equipped with an setable clock
made non-volatile thru the use of a lithium battery.

SUPRA

All of Supra's interfaces are quite good, and as flexible and have the
same features as ICD in fact, at this time we reccomend the use of the
Supra system as it has more recent updates. Also, Supra provides
additional chaining thru scsi ports.

The configurations for the hard disk systems are variable, for example,
if you wished to use the stand alone system with a different computer you
would be able to do so simply by changing the interface.

Expandable means you can add another drive at a later date in the
existing cabinet without major circuitry changes. The proper cabinets are
those made for the IBM twin half height disk drives. They take up less of
a footprint than the SH204 and have a 70watt switching power supply and

blower included in the cost. Also included in the price is a blank panel for the empty drive space if you are using only 1 half height drive to start with. The cabinet fits like a glove not like an old garbage bag..

-TANGERINE DREAM-
==========

REVIEW SEPT 24 1988 CONCERT, BERKELEY CA.

For those of you out there who do not know who or what Tangerine Dream are, here is a short explanation.

Tangerine Dream are a 3 piece sythesizer group from Germany. They have been around making music since the late 60s/early 70s. I have been listening to them since around 1975. They are probably the pioneers of modern electronic music. They have put out at least 20 albums and many soundtracks. The band has gone through lineup changes a few times and of the original three only one remains, Edgar Froose. They have retained much of their original style although they have evolved as any group worth their artistic talent should. As electronics itself has evolved in music so comes the use of computers in electronic music. Tangerine Dream

has adopted the Atari ST into their world to control much of what they do. The computers (they use 11, 5 in concert) control sound patches and rhythms and do a lot of musical housekeeping.

Tangerine Dream performed live at the Berkeley Community Theatre, Saturday September 24th. It was one of three tour stops in California. They have criss-crossed their way from Canada through the States and will finish up in Vancover BC this week. The tour promoted their latest album 'Optical Race'. It states on the back side of the album cover 'This album has been produced on the ATARI ST using Steinberg/Jones Software'. Even though I have been following them for many years, this was the first concert of theirs I had ever seen. Atari Computers sponsored the tour and you could tell the moment that you walked into the theatre. We were greeted with a big banner with Tangerine Dream and Atari logos plastered all over it, a treat for an Atari freak like myself. The stage setup consisted of three stations with many synths and a couple of ST's (Megas I think) at each one. What a sight for these Atari lovin eyes, especially with thousands of Tangerine Dream fans all around. Enuf' of this, on to the performance.

Andy Summers (ex-Police guitarist) opened up the show for them with a very short set (thank heaven), just a rhythm machine and a guitar. It was not exciting. When Tangerine Dream began their set they were greeted with cheers that told you were in the company of some very excited and loyal fans. I had not known they had such a following. The music was very well projected with the complexity and synchronization that one rarely has the pleasure of witnessing. About half of the material was from the 'Optical Race' album. The other must have been new, at least to me. The rhythm tracks, synth drum sounds and lead keyboard work was simply amazing. I found myself chuckling with the enjoyment that I was in, sometimes wondering if I was listening to a giant CD player. That is how clear and precise it all was. The music was more mainstream, rhythmically 'rolling' and more intricate than their past works I am accustomed to. Their previous stuff was more spacy and eerie with a more heavy,synthetic sound. They had a great light show that seemed to be controlled by one of the sythesizers. Lights flashing,moving and pulsating creating something visual out of the audio. A few times we were shown the individual qualities of the group with piano solos and Edgar Froose's electric guitar work. They were called out for two encores which they played two or three more numbers each. It was a evening that I enjoyed very much. I hope some of you also share my feelings about the concert and were able to attend one of the many tour stops. Some diehard Tangerine Dream fans are undoubtedly feeling that they are maybe going commercial with their new sound. Well, Yes I guess they are. But it is a healthy step forward to reach a wider audience than they have had and they sure sound GREAT. Don't get scared off, they are not nearly as commercial as

say Windham Hill, and I consider myself THE diehard Tangerine Dream fan. I wish I could explain to you better what Tangerine Dream are all about. The only way to know is to experience them yourself. If you are a seasoned fan of electronic music buy anything and everything by them. If you are new to the field or are more mainstream (normal?) in your musical tastes then start with 'Optical Race' and go backwards from their. If you share my interest in Tangerine Dream drop me a line.

If anyone can tell me where I may find the video that they were selling at the concert please let me know.

Professional GEM by Tim Oren
Column #6 - Raster Operations

This installment of ST PRO GEM, is devoted to explaining the raster, or "bit-blit" portion of the Atari ST's VDI functions.

Please note that this is NOT an attempt to show how to write directly to the video memory, although you will be able to deduce a great deal from the discussion.

DEFINING TERMS

To understand VDI raster operations, you need to understand the jargon used to describe them. (Many programmers will be tempted to skip this section and go directly to the code. Please don't do it this time: Learning the jargon is the larger half of understanding the raster operations!)

In VDI terms a raster area is simply a chunk of contiguous words of memory, defining a bit image. This chunk is called a "form". A form may reside in the ST's video map area or it may be in the data area of your application. Forms are roughly analogous to "blits" or "sprites" on other systems. (Note, however, that there is no sprite hardware on the ST.)

Unlike other systems, there is NO predefined organization of the raster form. Instead, you determine the internal layout of the form with an auxiliary data structure called the MFDB, or Memory Form Definition Block. Before going into the details of the MFDB, we need to look at the various format options. Their distinguishing features are monochrome vs. color, standard vs. device-specific and even-word vs. fringed.

MONOCHROME VS. COLOR

Although these terms are standard, it might be better to say "single-color vs. multi-color". What we are actually defining is the number of bits which correspond to each dot, or pixel, on the screen. In the ST, there are three possible answers. The high-resolution mode has one bit per pixel, because there is only one "color": white.

In the medium resolution color mode, there are four possible colors for each pixel. Therefore, it takes two bits to represent each dot on the screen. (The actual colors which appear are determined by the settings of the ST's pallette registers.)

In the low resolution color mode, sixteen colors are generated, requiring four bits per pixel. Notice that as the number of bits per pixel has been doubled for each mode, so the number of pixels on the screen has been halved: 640 by 400 for monochrome, 640 by 200 for medium-res, and 320 by 200 by low-res. In this way the ST always uses the same amount of video RAM: 32K.

Now we have determined how many bits are needed for each pixel, but not how they are laid out within the form. To find this out, we have to see whether the form is device-dependent or not.

STANDARD VS. DEVICE-SPECIFIC FORMAT

The standard raster form format is a constant layout which is the same for all GEM systems. A device-specific form is one which is stored in the internal format of a particular GEM system. Just as the ST has three different screen modes, so it has three different device-specific form formats. We will look at standard form first, then the ST-specific forms.

First, it's reasonable to ask why a standard format is used. Its main function is to establish a portability method between various GEM systems. For instance, an icon created in standard format on an IBM PC GEM setup can be moved to the ST, or a GEM Paint picture from an AT&T 6300 could be loaded into the ST version of Paint.

The standard format has some uses even if you only work with the ST, because it gives a method of moving your application's icons and images amongst the three different screen modes. To be sure, there are limits to this. Since there are different numbers of pixels in the different modes, an icon built in the high-resolution mode will appear twice as large in low-res mode, and would appear oblong in medium-res. (You can see this effect in the ST Desktop's icons.) Also, colors defined in the lower resolutions will be useless in monochrome.

The standard monochrome format uses a one-bit to represent black, and uses a zero for white. It is assumed that the form begins at the upper left of the raster area, and is written a word at a time left to right on each row, with the rows being output top to bottom. Within each word, the most significant bit is the left-most on the screen.

The standard color form uses a storage method called "color planes". The high-order bits for all of the pixels are stored just as for monochrome, followed by the next-lowest bit in another contiguous block, and so on until all of the necessary color bits have been stored.

For example, on a 16-color system, there would be four different planes. The color of the upper-leftmost bit in the form would be determined by concatenating the high-order bit in the first word of each plane of the form.

The system dependent form for the ST's monochrome mode is very simple: it is identical to the standard form! This occurs because the ST uses a "reverse-video" setup in monochrome mode, with the background set to white.

The video organization of the ST's color modes is more complicated. It uses an "interleaved plane" system to store the bits which make up a pixel. In the low-resolution mode, every four words define the values of 16 pixels. The high-order bits of the four words are merged to form the left-most pixel, followed by the next lower bit of each word, and so on. This method is called interleaving because the usually separate color planes described above have been shuffled together in memory.

The organization of the ST's medium-resolution mode is similar to low-res, except the only two words are taken at a time. These are merged to create the two bits needed to address four colors.

You should note that the actual color produced by a particular pixel value is NOT fixed. The ST uses a color remapping system called a palette. The pixel value in memory is used to address a hardware register in the palette which contains the actual RGB levels to be sent to the display. Programs may set the palette registers with BIOS calls, or the user may alter its settings with the Control Panel desk accessory. Generally, palette zero (background) is left as white, and the highest numbered palette is black.

EVEN-WORD VS. FRINGES

A form always begins on a word boundary, and is always stored with an integral number of words per row. However, it is possible to use only a portion of the final word. This partial word is called a "fringe". If, for instance, you had a form 40 pixels wide, it would be stored with four words per row: three whole words, and one word with the eight pixel fringe in its upper byte.

MFDBs

Now we can intelligently define the elements of the MFDB. Its exact C structure definition will be found in the download. The fd_nplanes entry determines the color scheme: a value of one is monochrome, more than one denotes a color form. If fd_stand is zero, then the form is device-specific, otherwise it is in standard format.

The fd_w and fd_h fields contain the pixel width and height of the form respectively. Fd_wdwidth is the width of a row in words. If fd_w is not exactly equal to sixteen times fd_wdwidth, then the form has a fringe.

Finally, fd_addr is the 32-bit memory address of the form itself. Zero is a special value for fd_addr. It denotes that this MFDB is for the video memory itself. In this case, the VDI substitutes the actual address of the screen, and it ignores ALL of the other parameters. They are replaced with the size of the whole screen and number of planes in the current mode, and the form is (of course) in device-specific format.

This implies that any MFDB which points at the screen can only address the entire screen. This is not a problem, however, since the the VDI raster calls allow you to select a rectangular region within the form. (A note to advanced programmers: If this situation is annoying, you can retrieve the address of the ST's video area from low memory, add an appropriate offset, and substitute it into the MFDB yourself to address a portion of the screen.)

LET'S OPERATE

Now we can look at the VDI raster operations themselves. There are actually three: transform form, copy raster opaque, and copy raster transparent. Both copy raster functions can perform a variety of logic operatoins during the copy.

TRANSFORM FORM

The purpose of this operation is to change the format of a form: from standard to device-specific, or vice-versa. The calling sequence is:

```
vr_trnfm(vdi_handle,source,dest);
```

where source and dest are each pointers to MFDBs. They ARE allowed to be the same. Transform form checks the fd_stand flag in the source MFDB, toggles it and writes it into the destination MFDB after rewriting the form itself. Note that transform form CANNOT change the number of color planes in a form: fd_nplanes must be identical in the two MFDBs.

If you are writing an application to run on the ST only, you will probably be able to avoid transform form entirely. Images and icons are stored within resources as standard forms, but since they are monochrome, they will work "as is" with the ST.

If you may want to move your program or picture files to another GEM system, then you will need transform form. Screen images can be transformed to standard format and stored to disk. Another system with the same number of color planes could the read the files, and transform the image to ITS internal format with transform form.

A GEM application which will be moved to other systems needs to contain code to transform the images and icons within its resource, since standard and device-specific formats will not always coincide.

If you are in this situation, you will find several utilities in the download which you can use to transform G_ICON and G_IMAGE objects. There is also a routine which may be used with map_tree() from the last column in order to transform all of the images and icons in a resource tree at once.

COPY RASTER OPAQUE

This operation copies all or part of the source form into the destination form. Both the source and destination forms must be in device-specific form. Copy raster opaque is for moving information between "like" forms, that is, it can copy from monochrome to monochrome, or between color forms with the same number of planes. The calling format is:

```
vro_cpyfm(vdi_handle, mode, pxy, source, dest);
```

5842. ST Report Volume II No. 55 (part 2/2)

Newsgroup: comp.sys.atari.st
Date: 1988-10-04 19:16:01 UTC
From: gdtltr@vax1.acs.udel.EDU
Message-ID: <1996@udccvax1.acs.udel.EDU>
Source record: 250392

As above, the source and dest parameters are pointers to MFDBs (which in turn point to the actual forms). The two MFDBs may point to memory areas which overlap. In this case, the VDI will perform the move in a non-destructive order. Mode determines how the pixel values in the source and destination areas will be combined. I will discuss it separately later on.

The pxy parameter is a pointer to an eight-word integer array. This array defines the area within each form which will be affected. Pxy[0] and pxy[1] contain, respectively, the X and Y coordinates of the upper left corner of the source rectangle. These are given as positive pixel displacements from the upper left of the form. Pxy[2] and pxy[3] contain the X and Y displacements for the lower right of the source rectangle.

Pxy[4] through pxy[7] contain the destination rectangle in the same format. Normally, the destination and source should be the same size. If not, the size given for the source rules, and the whole are is transferred beginning at the upper left given for the destination.

This all sounds complex, but is quite simple in many cases. Consider an example where you want to move a 32 by 32 pixel area from one part of the display to another. You would need to allocate only one MFDB, with a zero in the fd_addr field. The VDI will take care of counting color planes and so on. The upper left raster coordinates of the source and destination rectangles go into pxy[0], pxy[1] and pxy[4], pxy[5] respectively. You add 32 to each of these values and insert the results in the corresponding lower right entries, then make the copy call using the same MFDB for both source and destination. The VDI takes care of any overlaps.

COPY RASTER TRANSPARENT

This operation is used for copying from a monochrome form to a color form. It is called transparent because it "writes through" to all of the color planes. Again, the forms need to be in device-specific form. The calling format is:

vrt_cpyfm(vdi_handle, mode, pxy, source, dest, color);

All of the parameters are the same as copy opaque, except that color has been added. Color is a pointer to a two word integer array. Color[0] contains the color index which will be used when a one appears in the source form, and color[1] contains the index for use when a zero occurs.

Incidentally, copy transparent is used by the AES to draw G_ICONs and G_IMAGEs onto the screen. This explains why you do not need to convert them to color forms yourself.

(A note for advanced VDI programmers: The pxy parameter in both copy opaque and transparent may be given in normalized device coordinates (NDC) if the workstation associated with vdi_handle was opened for NDC work.)

THE MODE PARAMETER

The mode variable used in both of the copy functions is an integer with a value between zero and fifteen. It is used to select how the copy function will merge the pixel values of the source and destination forms. The complete table of functions is given in the download. Since a number of these are of obscure or questionable usefulness, I will only discuss the most commonly used modes.

REPLACE MODE

A mode of 3 results in a straight-forward copy: every destination pixel is replaced with the corresponding source form value.

ERASE MODE

A mode value of 4 will erase every destination pixel which corresponds to a one in the source form. (This mode corresponds to the "eraser" in a Paint program.) A mode value of 1 will erase every destination pixel which DOES NOT correspond to a one in the source.

XOR MODE

A mode value of 6 will cause the destination pixel to be toggled if the corresponding source bit is a one. This operation is invertable, that is, executing it again will reverse the effects. For this reason it is often used for "software sprites" which must be shown and then removed from the screens. There are some problems with this in color operations, though - see below.

TRANSPARENT MODE

Don't confuse this term with the copy transparent function itself. In this case it simply means that ONLY those destination pixels corresponding with ones in the source form will be modified by the operation. If a copy transparent is being performed, the value of color[0] is substituted for each one bit in the source form. A mode value of 7 selects transparent mode.

REVERSE TRANSPARENT MODE

This is like transparent mode except that only those destination pixels corresponding to source ZEROS are modified. In a copy transparent, the value of color[1] is substituted for each zero bit. Mode 13 selects reverse transparent.

THE PROBLEM OF COLOR

I have discussed the various modes as if they deal with one and zero pixel values only. This is exactly true when both forms are monochrome, but is more complex when one or both are color forms.

When both forms are color, indicating that a copy opaque is being performed, then the color planes are combined bit-by-bit using the rule for that mode. That is, for each corresponding source and destination pixel, the VDI extracts the top order bits and processes them, then operates on the next lower bit, and so on, stuffing each bit back into the destination form as the copy progresses. For example, an XOR operation on pixels valued 7 and 10 would result in a pixel value of 13.

In the case of a copy transparent, the situation is more complex. The source form consists of one plane, and the destination form has two or more. In order to match these up, the color[] array is used. Whenever a one pixel is found, the value of color[0] is extracted and used in the bit-by-bit merge process described in the last paragraph. When a zero is found, the value of color[1] is merged into the destination form.

As you can probably see, a raster copy using a mode which combines the source and destination can be quite complex when color planes are used! The situation is compounded on the ST, since the actual color values may be remapped by the palette at any time. In many cases, just using black and white in color[] may achieve the effects you desire. If need to use full color, experimentation is the best guide to what looks good on the screen and what is garish or illegible.

OPTIMIZING RASTER OPERATIONS

Because the VDI raster functions are extremely generalized, they are also slower than hand-coded screen drivers which you might write for your own special cases. If you want to speed up your application's raster operations without writing assembly language drivers, the following hints will help you increase the VDI's performance.

AVOID MERGED COPIES

These are copy modes, such as XOR, which require that words be read from the destination form. This extra memory access increases the running time by up to fifty percent.

MOVE TO CORRESPONDING PIXELS

The bit position within a word of the destination rectangle should correspond with the bit position of the source rectangle's left edge. For instance, if the source's left edge is one pixel in, then the destination's edge could be at one, seventeen, thirty-three, and so. Copies which do not obey this rule force the VDI to shift each word of the form as it is moved.

AVOID FRINGES

Put the left edge of the source and destination rectangles on an even word boundary, and make their widths even multiples of sixteen. The VDI then does not have to load and modify partial words within the destination forms.

USE ANOTHER METHOD

Sometimes a raster operation is not the fastest way to accomplish your task. For instance, filling a rectangle with zeros or ones may be accomplished by using raster copy modes zero and fifteen, but it is faster to use the VDI v_bar function instead. Likewise, inverting an area on the screen may be done more quickly with v_bar by using BLACK in XOR mode. Unfortunately, v_bar cannot affect memory which is not in the video map, so these alternatives do not always work.

FEEDBACK RESULTS

The results of the poll on keeping or dropping the use of portability macros are in. By a slim margin, you have voted to keep them. The vote was close enough that in future columns I will try to include ST-only versions of routines which make heavy use of the macros. C purists and dedicated Atarians may then use the alternate code.

THE NEXT QUESTION

This time I'd like to ask you to drop by the Feedback Section and tell me whether the technical level of the columns has been:

A) Too hard! Who do you think we are, anyway?
B) Too easy! Don't underestimate Atarians.
C) About right, on the average.

If you have the time, it would also help to know a little about your background, for instance, whether you are a professional programmer, how long you have been computing, if you owned an 8-bit Atari, and so on.

COMING UP SOON

The next column will deal with GEM menus: How they are constructed, how to decipher menu messages, and how to change menu entries at run-time. The following issue will contain more feedback response, and a discussion on designing user interfaces for GEM programs.

ST REPORT CONFIDENTIAL
======================

Sunnyvale CA Sam Tramiel will press for continued upswing in
------------ activity at Atari by personally overseeing all PR
releases for accuracy.

New York NY Atari will be showing a number of new products at the
----------- Comdex show this fall. The rumor mill has it just the
opposite ....why?

Washington DC The show was a success but why the NO SHOWS?? Migraph
------------- Astra, Alpha etc....

Rockville MD GEnie Online Services has awarded Gadgets by Small
------------ it's own Roundtable. Congratulations Dave! It will
open in a few days.
```

Toronto CA Seems a Beta Copy of Calamus got loose and is now in
---------- the US even with a translation of the RSC file! From
what we have seen, the "other DTP packages" had better
watch out, this one is ULTRA SUPERB.

Orem UT Word Perfect Corp. has announced through Jeff Fowler,
------- that Version 4.1 will be the FINAL release of the ST
VERSION. Hmmm, here we go again! ARRRRG!

Sunnyvale CA Watch for all the ST units to be shipped with "mega"
------------ type cases and keyboards.

Long Island NY Magic Shadow Archiver will process a "boot" disk so it
-------------- can be arced and sent over the modem, unarced and
processed and be as good as the original. Look for
this program it is shareware!

INSIGHT into the ST'S FUTURE
==========
Part III - Software
---

by Micheal Arthur

Of course, NO computer has a future without innovative software.

PC-Ditto is an example of how innovative ST software can be, and has also had a great effect on the ST market. Right now, it is about 80 percent as fast as an 8086 chip, only in SOFTWARE.

Avant Garde is upgrading PC-DITTO, though, so it will be JUST as fast as the 8086 chip. Meaning that it, a $90 product, will be just as good as the Amiga Bridgeboard, a $590 product.

But Commodore is making a new Bridgeboard, having the 286 chip inside, and although it will probably not support OS/2, it WILL support other 286 specific programs, like Windows/286,(A new version of Windows custom made for the 286 chip, intended to replace Windows 2.0)and will be MUCH faster, at 10-12 MHZ. Although PC-Ditto will run at a similar speed with Turbo ST, it won't have much room for improvement after the update in December.

So Avant Garde might take either of two paths:

1) Make a 286 version of PC-Ditto, which could only effectively run with Turbo ST. Although this would be logical, as well as pretty good, as it would upgrade PC-Ditto's capabilities, it would require MUCH more work, and might not be of much advantage to a lot of ST users.

2) Make a Hardware/Software combination, with most of the emulator itself in software, but having the parts that would hamper the software's performance, or could be done better in hardware in an expansion card that would go in the ST Expander.

This would be more versatile than software, as it would make support of OS/2 possible, shorten the time that the emulator would take to be made and could be subject to further improvement, including built-in graphics chips letting PC-Ditto support the EGA standard with an ST Color Monitor.

Avant Garde could also take a third route, deciding to make other products for the ST (Although they have said that they are a "one trick pony") or making an expansion card so PC-DITTO can use the ST's extra (above 703K) memory as LIM/EMS memory.

Omnicard

NOT Hypercard, Omnicard. A company called BerrysBit A.S.C is planning to come with a "Hypercard-like" application, called Omnicard, at around November. This program will have an Iconic User Interface, which is now lacking in similar programs such as Zoomracks.

From their announcement on GEnie:

"A completely integrated software package is also available from the new desktop, including a word-processor, paint program, database, telecommmunications, mini-desktop (particularly of interest to the power user with a lot of folders), and an exceptionally easy to use program "Authoring Environment" akin to Hypercard itself."

"This Authoring Environment allows the novice to begin programming in the most effective way, without him even realizing it! A card metaphor is used throughout, to heighten the Stack (We call them decks) image. If you can organize a speech, you can write a program. Buttons, icons, graphics and text replace hundreds of lines of code, that to most look like Greek!"

"Optimized on a Mega 2 or above, this will be THE program for the Atari ST."

In this respect, they are partly right, as Omnicard would give the ST many benefits that Hypercard has brought to the Macintosh, like a simple, but powerful programming language using the latest concepts in how computers work.

While it will not be THE program for the ST, it will have a great impact, at least on how OTHER computer users view the ST.

Desktop Publishing

Desktop Publishing (or DTP) products for the ST will begin to rival their IBM and Mac counterparts, as shown by the upcoming Publishing Partner Professional, and Calamus (by ISD, the makers of VIP Professional). The ST will also become a very good choice for it, as the 1280*960 monitor w/card being made in Europe makes it to the US, maybe also being sold by ISD.

While the Mega ST and SLM 804 will also help the ST to further penetrate this market, the ST will never become remotely as successful in the DTP market as they have,and will continue to be in the MIDI market, as IBM and

Mac products will continue to bring more performance than ST programs, causing it to only be considered in a small degree

Spreadsheets

Spreadsheets are the most widely used applications for computers today, and it is not coincidence that most computers setting a standard have had their first big break with a spreadsheet having features above and beyond what had been previously seen. (Lotus 123 and Excel, for examples)

Even though some GOOD spreadsheets are coming out for the ST, and one in particular, LDW Power, will be better than Lotus 123 Revision Two, I don't think the ST has much chance in this area, as Lotus is making a Revision THREE of 123, and products like Wingz for the Macintosh,which OUTDO Excel, will be light years ahead of the ST, which won't have anything even half as good as Excel for a while.

As ST users can just get a Spectre 128, this won't really matter if you need to use its features NOW, but that doesn't count when people consider a computer based on its own merits and applications. In fact, this might just be a "chicken and egg" problem, as ST spreadsheets as good as Excel won't come out as quickly unless more businesses buy ST's, and more businesses WON'T buy ST's if it doesn't have a spreadsheet powerful enough for them.

Advertising, and Public Opinion about Atari

Contrary to opinions of a few, MOST people will NOT consider the ST based on the rational, "Is it a good computer, with good applications out for it at a decent price?", but will most likely express strong reservations towards the ST.

NOT because they have anything against it, but simply because of the belief out there that an Atari is not really a computer. While this is an OBVIOUS fact to almost ALL ST Enthusiasts, it seems that some people at Atari do not seem to realize that the general consensus of opinion is that the name Atari stands for "Good Game Machines". Thanks to the Atari 2600, and the Arcade Machines that Atari Games (the only part of Atari still owned by Warner Brothers) is noted for.

And usually, the ONLY way to completely cure a bad PR problem is to do the ONE thing that Atari has not said they will do, the MAIN thing that Apple did to make the Macintosh popular among IBM users, who never before saw a need for anything other than DOS, the MAIN thing that caused the C-64 to become the second best selling microcomputer of ALL TIME, and one of the things that Commodore has said they WILL do for the Amiga.

ADVERTISE.

And NOT just in ST Magazines, where the readership ALREADY owns Ataris.

I am NOT suggesting that Atari start a major advertising campaign when they are obviously not ready to meet the demand that it would bring, but I DO suggest this:

That Atari start advertising,at least on a small scale,with a few good ads on TV for the ST, or with a few good business-related ads in computer magazines such as Byte.

When the Atari Factory starts up next year, and Atari WILL be able to meet the demand that advertising will bring for the ST's, then Atari will probably start a major advertising campaign.

Their main focuses should (and probably will) be:

1) In TV advertisements, to educate the American public about the ST's capabilities, and to FIX the perception that Atari is just a Game Machine company.

2) To start advertising in business-related publications, emphasizing the ST's raw power with the good products now out for it, while showing the option of using Mac software.

IBM applications won't be emphasized so much, as PC-Ditto is only as fast as an IBM PC.

3) To support large-scale advertisements of ST software products.

4) In the Educational Market, advertising HEAVILY to both Universities directly,trying to displace the trend of using Macs and IBMs there, and to publications that deal with this market, with ads showing its superiority to the Apple II series.

To better aid this, though, Atari MUST support ST software developers in making products for this segment of the market, as well as supporting a network of educational dealers, who would already have been full-service ST dealers, but who would have a staff specifically targeted for the needs of this market. Commodore has already begun to do this with the Amiga.

IF Atari is smart, they will also give GOOD Educational Discounts and Specials to Schools for the ST, maybe having a 520 or 1040 ST with Color Monitor and a package of several good pieces of educational software, for a price of under 1000 dollars, directly competing with the Apple IIgs.

Also, Atari's problems with "Atari Bashers" will definitely decrease SOON, maybe even STAYING at a tolerable level if Atari makes sure that the Atari Factory is open before December. Also, Atari will be MUCH more open to suggestions in the future.

The Atari Factory

Of course, ANY plans that Atari makes must be dependent on the ability to manufacture these products, as experienced business executives know that you cannot successfully come out with a product that will be VERY popular unless you have a decent manufacturing base to meet the demand.

Seeing this, Atari plans to make a manufacturing plant in the US, to be in Houston, Texas. This plant will primarily attend to the demands of the US ST market, and will probably preclude any advertisements by Atari.

IF Atari is smart, they will seriously consider making their OWN RAM chips for the ST in THIS factory. Not only would making their own RAM chips be less expensive than buying them, in ANY RAM market, but the import fees of things made in Europe and Japan are generally more than the price of importing things from the US there.

However,they haven't yet gotten the facilities, and it will probably not be producing ST's or ST peripherals with it until the beginning of next year.

This would be a disaster, meaning that there would be little to no advertising for the Atari ST during most of the Christmas season. Also meaning that the momentum generated by the new ST computers/peripherals would be a fraction of what it could be.

And Commodore plans to advertise HEAVILY for the Amiga, both coming out with new Amiga products (like the 286 Bridgeboard) and advertising to sell Amiga 500's in the home and educational markets.

Miscellaneous ST Info

Here are the addresses and phone numbers for info on some of the products previously mentioned:

OmniCard

BeerysBit ASC,Inc;
8174 Century Circle East #8
Indianapolis, In 46260
(317)872-8622

Spectre 128

Gadgets By Small, Inc.
40 W. Littleton Blvd., #210-211
Littleton, Colorado 80120
(303)791-6098

Turbo ST, ST Expander

Megabyte Inc.
109 W. Bay Area
Webster, Tx 77598
(800)255-5786

(A little sidenote on this; Megabyte Inc.'s 800 Number is VERY GOOD, superlative in fact, having people who KNOW a LOT about their products, and who are VERY courteous. THIS should be the model for ALL companies, ST or otherwise, to follow, as even the LONG DISTANCE numbers of some companies tend to bring less than preferable service.)

GEM Multi-Tasking

30-Sep-88 20:50:31
Sb: #111893-#Farewell
Fm: JOHN RULEY 76227,117
To: Neil Harris 73256,3275 (X)

I just got the word that I can let the cat out of the bag NOW:

I spent last weekend at DRI in Monterey. GEM multitasks. Read that again: GEM MULTITASKS!
No compromises - and a *nice* interface, with multiple "virtual

consoles", each of which can hold several windows. Desk accs are gone - but, then again, they really aren't. The DESK menu still has 6 positions for application names, which can be used to launch any GEM app as if it was an accessory.

This is all running RIGHT NOW - I saw it work. And here are two biggies: I saw it running on a Hercules monochrome system (720x348 BW graphics) and it was updating as fast as the graphics would allow WITH FOUR WINDOWS OPEN, and you can run DOS programs in it! It traps the screen I/O and displays inside a window - I saw WORDSTAR running on screen concurrently with GEM output.

Folks - it's a whole new ballgame!

John.

---

a short but sad note...

WORD PERFECT & ATARI
==========

a few words from:

Jeff WILSON, Word Perfect Corp

....Once again, the situation has changed, probably for the last time for a while. I will still be working on the ST, but at this point primarily to support and enhance the existing version of WordPerfect. New major versions of WordPerfect and other products have been placed on hold for primarily one reason: WordPerfect Corporation has watched the presence of Atari Corporation in the US marketplace significantly diminish over the last year.

Atari has reduced the number of dealers supporting them, and been allowing only a minimal number of ST's into the US marketplace, has failed to support dealers, developers, or Atari owners, and has, quite frankly, lost WordPerfect Corporation's faith. WPCorp will not commit itself to several years worth of R&D for a market in this condition.

The hold will probably remain in effect until Atari market conditions change significantly. This is not an official statement, but I will not misrepresent the current state of affairs.

As a die-hard Atari fanatic, it disappoints me terribly to have come down to this. However, from a business standpoint, I understand and agree with the decision. I hope that WordPerfect Corporation will be able to complete and release the many exciting projects that have been underway since the release of WordPerfect 4.1 for the Atari, but this will only happen on the condition stated above. We will continue to fully support 4.1 for the Atari, in fact, you will probably see enhancements that would not have come about any other way.

Jeff R. Wilson

5843. 96TPI (80 cylinder) 5.25" floppy on a ST - what problems does this entail?

Newsgroup: comp.sys.atari.st
Date: 1988-10-04 19:37:00 UTC
From: HELLER@cs.umass.EDU
Message-ID: <8810041939.AA19135@crash.cs.umass.edu>
Source record: 250393

I have a 1040ST with its built-in 3.5" DSDD floppy and a home-brew/Supra 40Meg hard disk. I am thinking of adding a second floppy of the 5.25" flavor. I am *not* doing this for PC-Ditto or to access MS-DOS stuff. My "other" machine is a Stride 440 which has 96TPI floppies. I run OSK on the ST most of the time and am now in the process of porting OSK to the Stride and want to be able to format and create boot floppies for the Stride. Other than fun & games with connectors, are there other things I need to fuss with?

5845. Re: GEM programming

Newsgroup: comp.sys.atari.st
Date: 1988-10-04 21:52:49 UTC
From: pa1132@sdcc15.UUCP
Message-ID: <596@sdcc15.UUCP>
Source record: 250395

Just a question about Laser C: Do they use standard windows, or they also create some pusedo-GEM windows? If so, are those pusedo-GEM windows also used by the programs created in Laser C? From the review I see on magazines for Laser C, their windows indeed look different. Also, does Laser C's labrary contain routines to support scrolling within windows?

Just aN after-thought: Since GEM is so slow, so dumb, anything which replaceS GEM's component is desirable.

5846. GEM and TOS

Newsgroup: comp.sys.atari.st
Date: 1988-10-04 22:07:13 UTC
From: pa1132@sdcc15.UUCP
Message-ID: <597@sdcc15.UUCP>
Source record: 250396

Is there any way to limit the text output of TOS to a section of the screen instead of the whole screen so that printing, scroLling, etc just happens inside that section? If this can be done, we can put a TOS text window inside a GEM window and by calling TOS routines instead of VDI scrolling of text can be much faster. Of course, this may mean that we have to limit the boundary of windows to be on the multiple of 8 pixels.

5847. Umoria lockup

Several people had reported problems with the version of Umoria which had been posted to the net.

I'm wondering how widespread the problem may, or if these are isolated instances where the file may have been damaged in spite of the error checking of ARC...

I've had the same problem of the game locking up within the first 5-10 moves on the town level, about 75% of the time. The cursor stops flashing, and the system is completely dead, requiring a total re-boot and re-load of the game. As annoying as that is, the problem is compounded by the fact that Moria erases your "saved" game file, which means you have to make a .BAKup of the save file every time you play, in case the machine dies *after* deletin the file..! This is on a 1Meg machine with *nothing* else in memory..

If this is just an isolated case, I may try redownloading the files and trying again...

5848. gulam problems - please help

Newsgroup: comp.sys.atari.st
Date: 1988-10-05 10:53:41 UTC
From: klute%trillian.irb@unido.uucp
Message-ID: <646@laura.UUCP>
Source record: 250398

I have some problems with parameter transmission to gulam shell scripts. First, after reading $* *once* (e. g. echo "$*") it appears to be *empty*. So if you want to use it several times you have to copy it to some more "resistant" gulam variable (e. g. set param "$*").

Ok, I can live with that. But now comes the real problem: I want to give some options beginning with a minus sign '-' to a gulam script like

script -a -b <files>

What happens is that only a crippled parameter string is transferred to the script: *no* minus-options and not all <files>. If the minus-options are omitted everything works just fine. Try the following script:

```
set param "$*"
echo "$param"
echo "$*"
foreach i { $param }
echo $i
endfor
```

I have already tried things like
script '-a' '-b' file1 file2
script '-a -b file1 file2'
but nothing works. Any ideas?

Thanks in advance
Rainer Klute

From: achowe@lily.waterloo.edu
Message-ID: <30@orchid.lily.waterloo.edu>
Source record: 250401

I have a problem. I bought a second hand Epson FX-286 printer about a month ago except there was no printer manual. Now the dealer who handled the private sale managed to get me a manual for an FX-286e. The only problem is that all the features in the 286e are not in the 286 (the older model). Epson Canada apparently didn't not have any old copies.

Could someone please tell me where I could get a copy of the correct manual, or tell me the ALL the codes I have available to me. I know some but not the ones related to graphics. I don't even know if this model was capable of graphics. HELP.

Thanx
- Ant

>does this mean? Can it be corrected?

"Do not be alarmed. There is nothing wrong with your Desktop."

What's going on is that ALL of the sectors on your disk are full, and that
622,367 bytes of that is being used for data. The rest of it is used for
"overhead", such as disk directories (and folders), FAT records (to keep
track of how a file is linked), and unused sectors. (In short, each sector
is allocated for 512 bytes. If you created a file that was only 10 bytes long,
you would have 502 bytes "wasted" because the sector is not completely full)

That depends on what news software you are using. With our
implementation of "rn" here at Schlumberger, I *do* see the messages I
post, but not in the same session in which I post them. Also, much of
the news software in the United States has a "Distribution: " field,
which can restrict the propagation of articles. I suspect that many
of the articles you miss are not marked for "world" distribution.
(Correct me if I'm wrong; I assumed that you are not located in the
U.S.)

>
> I'm only in this for the mummy.
>richard@gryphon.CTS.COM {well connected site}!gryphon!richard

This is the kind of statement which, on the face of it, appears very,
very difficult to take seriously. If the author of PP really thinks
the ST is a dog (er, sorry, I mean a pig), it would be stupid wasting
time trying to develop software for it just to prove it can be done.

This is a little like the story I read years ago about the track coach
who had his runners run with weights on during practice on the theory that
running without them in the real meet would help them run faster.
In the actual track meet, his runners did poorly; the strategy of runninng with
weights proved to have no relevance to running faster without them. By
the same token, if you want to develop programs on system A, spending
time working on system B (or system ST :-) would make little sense.

The only reason a serious programmer (i.e., one who is a professional)
would have to develop a massive program on a specific system would be to
sell that program to users of the system and make money. You don't
spend months and months working with no hope of return on effort unless
you are a dilettante.

I suspect that if PP's author really did say this, and we only have
unsubstantiated heresay evidence to that effect, it was meant as a joke.
Which brings me to my final comment; why can't we have more informative
disucssions of programs such as PP instead of the foolish remark which
prompted this response?

Well, I was just asking!

Personally, I feel that if "ApeInc" wants to distribute their magazine
on the USENET, then *they* should trim the ads, and do so themselves.
By propagating their newsletter, you are giving them more credence
than they deserve. I have read several "issues" now, and it is clear
that they are expressing lots of personal opinion, with very little
(if any) independent investigation or research to corroborate. Much
of the factual information they publish is available elsewhere, in
places such as the Atari Forums on Compuserve, the Atari Roundtables
on GEnie, in printed magazines such as STart, STLog, etc.

So, bottom line, if it's a question of ads or no ZMAG, I won't miss
it.

>the show info. option on the desktop and got the same results. What
>does this mean? Can it be corrected?

Here's what actually goes on as far as disk free space is concerned:
Free space is defined as the number of bytes available in free sectors
on the disk. Used space is defined as the total number of bytes used
in all files on the disk. The thing is that space on the disk is
allocated in multiples of 1k (2 sectors). Therefore while in your case
622367 bytes are being used the other 90K+ bytes are being "lost" in
chunks of between 1 and 1023 bytes per file. (This is a case of what is
known as internal fragmentation; the same thing can happen with memory
allocation (except for the Malloc bug which doesn't let you go on that
long (TOS 1.4 will let you see this in action (from what I've heard a
lot of work has gone into it)))).

This can be confusing since it means that even though there are 0 bytes
free on a disk you can still write up to 1023 bytes PER FILE by
appending the data, and there's nothing you can do about it.

If you think it's fun on a floppy, try a 10Mbyte hard disk partition with 3000+
small files. It looks like about 1.5Mbytes is missing!

Hope this helped.

5857. Blitter problem

Newsgroup: comp.sys.atari.st
Date: 1988-10-05 17:36:47 UTC
From: root@yale.UUCP
Message-ID: <39610@yale-celray.yale.UUCP>
Source record: 250407

I just got a Mega-4 and am having a problem with the blitter chip. With the blitter turned off, everything is fine. With it on, partial "shadows" of the window border get left behind when I drag a window across the screen with the mouse. These are little vertical lines of random height running up from where the bottom of the window was as it was being moved. It looks as if the CPU is not synchronizing itself properly with the blitter chip, perhaps aborting a blit in the middle. The problem occurs with both TOS 1.2 (the Mega ROM) and the new Developer's version of TOS 1.4.

Has anybody seen this problem before? Do I have a bad blitter chip, or is the problem systemic with all Mega's?

>satisfactory.

One solution you might wish to look into is a program called G+Plus, which replaces the Atari GDOS with a functional equivalent. The nice thing about G+Plus is that you can have individual ASSIGN.SYS files for individual programs (ie. WORDUP.SYS, DGELITE.SYS, etc.) which you call up from a desk accessory.

I've been using the package for about a week, and it hasn't interfered with any of the many programs I've run, and I haven't seen the system slowdown which I've associated with the GDOS program itself.

You can get more information through GEnie, or write to the folks at CodeHead Software (Box 4336, N. Hollywood, CA 91607) for more information.

5860. Allocating long-lived memory blocks

Newsgroup: comp.sys.atari.st
Date: 1988-10-05 18:31:16 UTC
From: root@yale.UUCP
Message-ID: <39617@yale-celray.yale.UUCP>
Source record: 250410

The following problem came up while writing a resizable ramdisk. What I wanted was a ramdisk which could be installed, resized, and deinstalled without causing a reboot of the system and without losing memory blocks. The idea was to break it into two parts: a small memory-resident driver program and an ordinary transient program RD to interact with the user and allocate/deallocate memory for the ramdisk.

The problem is, how can RD allocate a memory block that outlives the invocation of RD, for GEMDOS automatically frees all memory allocated by a process when it terminates. I have found two hacks which both seem to work, but both violate official Atari specs for safe programming:

1. After allocating the block, search GEMDOS's memory allocation chain to find the descriptor of the just-allocated block, and change its owner field to that of the oldest process in the process list. That way, the block is not recognized as being owned by RD and is not freed when RD terminates.

2. Change Gemdos's current process pointer to point to the oldest process in the process list, Malloc the memory block, and then restore the current process pointer. Again, the memory block ends up looking like it belongs to some other process and hence is not freed when RD exits.

In both cases, the memory can be subsequently freed by a reverse of the above, namely, force the block's owner to agree with the current process pointer and then call Mfree.

The first method requires the undocumented location of the head of the memory allocation chain and also relies on internal Gemdos data structures. The second method uses a location that has been newly documented in TOS 1.4, but it involves writing to that location, which is not supported.

Question: Is there a supported way of accomplishing this?

5861. Re: GEM programming

Newsgroup: comp.sys.atari.st
Date: 1988-10-05 18:41:07 UTC
From: apratt@atari.UUCP
Message-ID: <1179@atari.UUCP>
Source record: 250411

What you are forgetting about GEM is that the window stuff is provided for your convenience: you don't HAVE to call or enable them; you can just write your own.

For example, create a window with no title bar, no close box, no full box, no size box, no sliders and no arrows. Wow! A rectangle! But this is a rectangle which gets redraw messages and other window handling. Now, you put your OWN stuff into the window: your own scroll bars (with page numbers if you like), your own title bar (with extra gadgets if you like), etc. All these things can be objects, and AES will help you manage them and tell when the mouse is clicked on them.

AES provides the primitives for doing these things, IN ADDITION TO the high-level management routines, which you can use if you're satisfied with them. If you aren't, go out and make some of your own.

(the author wonders how a disk can be full if all the file sizes total less
than the amount of space on the disk...)

Remember that disks are split up into 1K blocks, and that those blocks are
the minimum unit of disk space that can be allocated. When you create a
1-byte file, you lose 1024 bytes of free space on the disk (or 2048, if you
are writing to a folder that needs to get bigger to hold the new file entry).
Thus, 360 1-byte files would fill up a single-sided disk, though show info
(and the "bytes used" field in desktop windows) would only show 360 bytes
being used.

These are my opinions, and in no way reflect those of UCSC, which are wrong.

NOTE!!!

Please be considerate of the other users of netlib as well as those sites who are kind enough to process email! Limit yourself to no more than five file parts per request per day.

Some sites have been protesting about handling the large volume of mail which is created by long requests. Without their cooperation, our file server could not exist in its present form. Also, long requests also tie up our limited resources here on lakesys while processing the email. (lakesys is not a mainframe, it sits on top of a desk :-)

Help netlib@lakesys to continue serving the ST community with UUCP access and cooperate with us. Thanks....

==========

To request files, send a message to netlib@lakesys.UUCP consisting of:

send volume1/filename/part.uaa from archives.atari
send volume1/filename/part.uab from archives.atari
send volume1/filename/part.uac from archives.atari
etc.

Be sure to include the volume name in your request (the example is volume1).

Note there is no space between the word "volume" and the number of the volume.

Subject for the message is not necessary.

Use the form above to assure that the parts will arrive as separate messages. The parts are no larger than 50k each.

This index can be obtained by sending:

send index from archives.atari

to netlib@lakesys.UUCP

A path which has proven to be successful for some users is:

lakesys!netlib@csd1.milw.wisc.edu

Any comments, problems or suggestions, please mail to martin@lakesys.UUCP.

I have two Magic Sac Plus cartrages and one Professional kit
for sale. These all have 64k roms installed.
The professional kit includes 1 Magic Sac, 1 printer driver, and
the Translator Box for reading Mac disks.
All are New! (and tested with the roms)

I just need $100 for Magic Sacs and $300 for the Professional Kit.
A hard drive on your system is highly recommended if you are considering
running the Magic Sac.

I personally still use a Magic Sac and can't afford to switch to
that more expensive new product which uses the 128k roms.
The Magic Sac still has it's place regardless of what some
people say just because a new version comes along.
The Translator works with that 128k cartrage by the way.

I was in the business of selling these items but I no longer have time.

In reply to Aric Freisen's comments that MichTron's "Pinball Factory" uses a weird format and writes to the disk, write protected or not...

In order to save time when mass-producing their disks, MichTron generally does NOT format the entire disk, but only formats the actual tracks that the program and files will be using. Thus customers have had difficulty backing up some disks by using the "Drag the disk drive Icon" method of copying an entire disk. In these cases, the disks may possibly be backed up by copying them file-by-file (assuming the disk is not otherwise copy-protected).

I can't say for certain, but what *might* have happened when Aric tried to save a pinball game he'd created, to the master disk is... with the write protect off, a partial file could have been written on whatever spare sectors were left over from the partial formatting. This partial file may have still shown up when trying to write to the disk when subsequently write-protected.. it's possible that the Pinball Factory does not report an attempt to write to a protected disk as an error (many MichTron games do not), but simply returned to the menu, leaving the partial file from before...

(Naturally this last is all speculation on my part, as I'm not about to try writing to my original Pinball Factory disk to check it out..! :)

5874. MIDI Interrupts

Newsgroup: comp.sys.atari.st
Date: 1988-10-06 08:48:13 UTC
From: SCHWIETZ@DBNUOR1.BITNET
Message-ID: <8810060809.AA13023@ucbvax.Berkeley.EDU>
Source record: 250425

Perhaps somebody has an answer to the following:

XBIOS function Kbdvbase() returns a pointer to a structure where - among others - three pointers (*kb_midisys)(), (*kb_vmiderr)() and (*kb_midivec)() are stored. As far as I know from several books on the ATARI ST, kb_midisys() is called, when an interrupt has occured (in one of the ACIAs), kb_vmiderr() is the MIDI error handler and kb_midivec() is responsible for receiving a byte from the MIDI port. But I couldn't find any further description of what the routines should do EXACTLY and when/how they are called. Therefore, I've disassembled the relevant XBIOS code in order to determine the precise entry/exit conditions for these routines, but with respect to old and future TOS versions I wonder whether I should rely on the information obtained in this way ...

Is there some sort of "official", detailed and reliable documentation of these (and possibly other) routines and TOS pecularities? Is the documentation, if any, available to "normal" users? Where? In W-Germany?

Any help would be appreciated.

-Edgar

PS: Please don't refer to "The complete, hmm ... almost complete TOS-Listing" compiled by S.T. Expert, author of the well-known books "GEM-Programming with XYZ-BASIC Version 2.10.1.13c" and "Inside the 74LS04". Or will this really be the "ultima ratio"?

>the world.
>
>I'm sure the European preference for colour is just as great, but
>the *relative* cost is higher. Same for other toys like CD players.
>

No, this is not the reason. Maybe, the Americans have more money than the
average European (although I have some doubts on this, especially with
Germany). But the price difference is not high enough (100$ -200$ from
monochrome to color monitor, less if you use a TV) to cause such a difference
between sold color and monochrome systems.
I guess the reason is that Americans use the ST often as a game machine
while Europeans do real work with it (text processing, programming and so on).
For this kind of work the monochrome monitor is an absolute need.
You get a system that has a better screen, higher speed and better user inter-
face than any 'industry standard' PC you can buy for double the money.
Especially students like the ST much for their work.
Isn't the rumour true, that the Americans didn't discover the ST as a
real PC, isn't it true that we have more Sts here in Europe than you in
America?
I for myself never thought of buying a ST without color monitor not because
of the price (I connect him to my Color TV with a scart cable for playing
games) but because of the superb screen.

PS. Apologies for my bad english.

5877. Re: Atari's hush hush policy dosn't stop Antic

Newsgroup: comp.sys.atari.st
Date: 1988-10-06 13:49:41 UTC
From: saj@chinet.UUCP
Message-ID: <6740@chinet.UUCP>
Source record: 250428

Aric Friesen posted an article bemoaning Antic's recent publication of a summary of Lee Isgur's recent stock analysis opinion of Atari Corp., filled with the kind of crystal ball announcements we used to get direct from Atari spokespeople. For what it's worth, a lot of magazines fill space by quoting securities analysts, Lee Isgur is highly regarded among both producers and consumers of stock analysis, and possibility is the analyst's stock in trade. It was the analysts who made the Wankel engine exciting a few years ago. As regular as Atari's possible products used to be, drug companies hint at possible
e
future drugs more regularly, with similar follow-through, and the analysts report it, and value vapor at so many cents on the dollar.
It's hard not to repeat Phillipe Kahn's comments: the ANALists (pronounced with a long a) PENILEize the computer industry. And his complaint that he saw nothing wrong with Lotus releasing their new version of 123 later than originally planned, but it bothered him that they seemed to be advertising lateness as a *feature*, and that the analysts believed it.

>look different. Also, does Laser C's labrary contain routines to
>support scrolling within windows?

Laser C's GEM-based shell does, indeed, use their own windowing routes
(at least it looks that way to me). Similarly, they use their own file
selector, and other custom dialogues.

HOWEVER, this applies to the shell only. The programs YOU create will use
standard GEM windows and GEM dialogues -- Unless you expend the extra energy
to write your own window handler routes.

As for scrolling, that's another thing for the programmer to sweat over
(What do you want, it's _only_ a compiler B-)

--R.J.

You basically have the right idea as described in the second algorithm, ie. change the _run variable pointer to point to the basepage of the oldest process which should be the desktop. This however is a problem if allocated within a program. We have just implemented this for SHADOW, and have it working very well, with some helpful advice from ATARI.

The _run pointer MUST point to a valid basepage, not the desktop's, which we found to cause trouble. Of course, the location of _run is not documented for pre-Mega ROMs, so you will have to hack out the location and hardwire it.

In article <586@sdcc15.UUCP> you write:
>
>Here is some questions about GEM:
>
> 1. Why is the number of windows limited to 8? Why did DRI design
> this way? With a miminum of 512k memory for the ST, memory
> shouldn't be a problem. Even on the earliest 128k Mac, there is
> no limit on number of windows you can have on the screen. Is
> there any way to modify the AES so we can get rid of the memory
> limitation?

My information is, that the Microsoft Company who developed GEM got some
trouble with Apple because of the violation of copyrights. As you know,
GEM is very similar to the Mac's user interface and Apple did not want
to see such a plagiate. I don't know the details, but the result was that
Microsoft was not allowed to produce an own user interface that is to
much Mac-like. Therefore, GEM got the eight-window restriction.
I don't know if there is an easy way - such as just to change a constant
value somewhere in the GEM-System - to modify GEM so you can get more
windows. But because of the fact, that I've never seen such a modifyed GEM,
I don't think that this is possible.
Of course, it's not a must to use GEM windows. Basicly, a window is just
some rectangular area on the screen. GEM provides only a little bit of
support for manipulating windows. The main think it does is to remark
existing windows and to send messages to your application if you click
somewhere in a window. So, the main parts of window actions are to be solved
by you application. Of course you can ignore the little bit of help GEM gives
for windows an write window routines by your own. This can be done without
the 8-window-restriction, of course...

> 2. How to get the menus to appear on other parts of the screen
> instead of the top line of the screen? I have seen some desk accs
> to have menu bar under their window title bar. How is that done?

GEM menus are just as they are. If you want something else, you have
to write your own procedures. You know the location of the active window,
and you know the mouse coursor postion on the screen.By comparing this
informations, you can detect if the mouse is in a position where you want
to have a menue. So, just paint one onto the screen. Highligt the selected
items when the mouse is pointing to them by redrawing the proper part of
the menue. Finally, dicard the menu by replacing it with the thinks you
saw in its position before the menue was created...

> 3. How to get bottons, editable (spelling?) text fields and other
> objects, that used to appear in dialog boxes, to appear in a window?

I guess this is possible. But have to know the GEM's Object Library very good. Menus, Boxes, Icons are stored in certain data structures which are described in the GEM's AES Guide. Every object has an position on the screen. This can be manipulated...

> 4. How to modify the appearance of windows? For example, in
> PageMaker for the Mac, icons are added to the border of windows to
> show the current page. Is that kind of trick possible under GEM?

Yes, it is. Some GEM Programms also use such icons. For examle look, look at GEM-Draw. But again, there are no standard procedures for this task and it has to be handeled by your own procedures.

>

Well, obviously it's running on an IBM-type PC.

Digital Research has had multitasking for years; you can go down to Egghead or Software Etc. and buy Concurrent DOS or Concurrent DOS/386 right off the shelf.

GEM is a package of mostly graphic services that runs on top of a host operating system. The significance of this report is that DRI has (finally!!) gotten around to getting GEM up and running on top of the multitasking OS.

InfoWorld reported two weeks ago that DRI has submitted GEM to the so-called Open Software Foundation as a proposed standard graphic interface to Unix. It would be an extended GEM with X/Windows support. (It has a lot of competition in this race.)

Now, about multitasking on the Atari:

* Of course it's possible, with rewrites of the operating system. Beckemeyer has had a multitasking extension to TOS for quite some time.

* Rumors say that Atari already has a multitasking TOS. A few weeks ago, Roy Good responded very carefully to a question about it; his answer boiled down to "not now." He did not say "not ever." You'll note that ST-Report flamed Roy pretty severely for allegedly stifling multitasking TOS in favor of Unix on the soon-to-be-released 680?0 box. (ET, TT or whatever).

(Aside: Six positions on the Desk menu? DRI hasn't learned much.)

From: to_stdnet@stag.UUCP
Message-ID: <612@stag.UUCP>
Source record: 250434

From: emh@omni.UUCP (Eric Hopper)

I don't think that you need to access a dialog's data structure
directly to get it to appear someplace else other than the center of the
screen.

Ah, yes. Here it is in the Laser C manual. To make a dialog box at
a given position you would have to use this function, or something simlar:

```
int make_dialog(dialog, your_x, your_y)
OBJECT *dialog;
{
int x, y, w, h, itemhit;

form_center(dialog, &x, &y, &w, &h);
x = your_x;
y = your_y;
form_dial(FMD_START, 0, 0, 0, 0, x, y, w, h);
objc_draw(dialog, 0, 10, x, y, w, h);
itemhit = form_do(dialog, 0);
form_dial(FMD_FINISH, 0, 0, 0, 0, x, y, w, h);
return(itemhit);
}
```

Of course this doesn't deal with the problem of drawing it within a
window, and handling the box yourself. That would involve all sorts of
complicated calls to objc, and graf routines that I don't have time to
research right now.

>BobR

Well, I don't know if it's an isolated case or not, but I've not had that problem. Everything (well, almost everything; bug report below) works fine with my copy. I do suggest you try to get another copy. If you have more problems, send me mail and I'll give you my address so you can send me an SASE w/disk.

The problem you have MAY be because you're running it from the desktop. I've tried starting it up from the desktop, which works, but I've never gone any further than that, because I don't know the VMS commands. I've run Moria from Gulam, the Do-It! shell, and NeoDesk without problems.

Bugs:

Wand of Wonder will send out every one of these at once:
Clone monster
Teleport Away
(Cloud effects)
These occur in the order above, and only take one charge. You don't know how annoying this can be.

Shop contents change when a saved game is restored (may be a feature, but I doubt it).

The shell escape function doesn't exactly do a shell escape. You can't return to the shell you called Moria from. You can, however, call a paging program, a disk formatter, ANOTHER shell, or whatever.

Scroll of Teleport Level causes a lockup.

Mages can reenter shops immediately after they've been thrown out (this is supposedly a feature; with high charisma, you should be able to do this sort of thing, but with mages charisma doesn't seem to matter).

Potions of Restore Life Levels don't seem to give you back all of the
lost experience. This may be a feature (but PC-Moria 4.83 doesn't
do this!).

>fine, for a few minutes, then .... you guessed it ...
>^@1itscambsitshippo********yyy12,45,67nnn^@^@^@^@

Sounds to me like a ring buffer is being overrun, causing pointers to
cross and point into memory where they shouldn't. It's a bug, you
can't fix it except by dropping the baud rate to 1200 or less.

>Another slight annoyance is that when I log in to any Un*x systems (most
>often a Sun 3/140 running SunOs 3.4), the terminal type is not recognised
>and defaults to DM2500. set term=vt52 works OK, but surely the emulation
>should answer Un*x's request for terminal identification? Or is SunOs
>getting it wrong, after all, we all know what terrible machines Suns are

[smiley at end of the above deleted. Just so's you know.]

No Un*x that I know of queries for terminal type, since most dumb
terminals wouldn't respond anyway. The terminal type on SunOs 3.4 can
be set in several ways. In the file "/etc/ttytype", there is a list
of terminal ports, and the associated terminal type (taken from an
entry in the "/etc/termcap" file). For example, you might see a line
that says, "vt100 ttya". This would determine the default terminal
type for that port.

You can override this in your ".login" file using the "stty" command,
with a few lines like:

```
set t=(`tset -S -m 'dialup:?vt52' -m 'unknown:?vt52' -m 'network:?vt52'`)
setenv TERM $t[1]
setenv TERMCAP "$t[2]"
unset t
```

This does several things. First, if the default terminal type (from
/etc/ttytype) is "dialup", "unknown", or "network" (this is
undocumented, but what you get when you do "rlogin" over ethernet),

the terminal type is set to "vt52". It also causes the shell variable "t" to be set to contain two strings; one is the terminal type (in this case "vt52", and the second is the /etc/termcap entry data for that terminal. Then it sets the environment variables TERM and TERMCAP to the appropriate strings, and un-sets "t". This will make programs that use termcap capabilites start up much quicker, since they get the TERMCAP string from the environment, instead of from the /etc/termcap file, which can be huge.

Hope this helps.

I for one enjoy seeing ST Report here. Yes, it's basically a collection of opinions and rumours, but that's all we get on Usenet in the normal course of events, so what's the big deal? Personally, I enjoy Dave Small's opinions (even if he is one heck of a major league Atari Basher). I've been reading Small since his days at "Creative Computing". And in the last issue, it was interesting to see Neil Harris' rebuttal immediately following Dave's strong comments.

If, for legal reasons or whatever, people strongly object to the advertisements, then perhaps this isn't the place for it. If so, however, I'd appreciate someone taking the trouble to send each issue to netlib@lakesys, or some other *uucp-accessible* site.

By any chance, are you running one of those clock accessories that put the time in the upper right hand corner? I observed the same thing, but only when that clock accessory is installed. I suspect it involves a reentrency problem with the routines. The accessory performs (I assume) a-line operations from interupt level and the code that handles the hardware blitter gets confused when it gets to many pending requests. Atari, can you say "semaphore"? Realize that this is a guess. Since the fastest speed up I have ever clocked the blitter to have was about 5%, Just turn the blitter off and forget it was ever there.

If you carefully read SALAD, analyze the Line-A variables (especially the ones at negative offsets from the line-A variable base pointer, which were previously undocumented), and experiment some, you will find that you CAN do this. The code is parameterized enough that this kind of thing is possible. You will still have to take care of clipping and redrawing... Read carefully and experiment, and especially experiment with accessories like the control panel active on the screen, to see if you got redraws working correctly.

It's worse than you think: if you create a file and write 10 bytes to it, 1014 bytes are being "wasted" -- files are allocated in "clusters" of 1K each. This is called "internal fragmentation" and is the kind of overhead you have to deal with. The alternative is to allocate files in bytes, which yields zero internal fragmentation but is REALLY SLOW and yields LOTS of external fragmentation. External fragmentation is the space used to keep track of the data: directories (including the root directory) and FATs.

Show Info on the desktop adds up the number of data bytes used in each file; that's the "bytes used" field. Then it uses the OS Dfree call to determine bytes available. You will notice that the bytes available is always an even multiple of 1K. The difference between (bytes used + bytes available) and (bytes available on an empty disk) is the internal fragmentation plus subdirectory space. (Root directory and FAT space is not counted in the "bytes available" field for an empty disk).

The Dfree call returns several numbers: the number of clusters on the disk to begin with, the number of clusters currently available, the number of disk sectors per cluster, and the size of a disk sector in bytes.

Note that a freshly-formatted disk will show two clusters already used. This is a bug in GEMDOS. It can be fixed, but we decided not to, because it creates problems with new versus old ROMs.

No, there is no supported way to accomplish what you ask. However,
the two methods you describe should work.

Please note that, while the current-process variable was documented for
TOS 1.4, it does exist in TOS 1.2 -- that's Mega ROMs. But it does not
exist, documented or not, in TOS 1.0, so don't assume it was there and
we didn't document it.

As you say, writing to this variable is not supported. However, if I
had to choose, that's the route I would take. I'm not promising,
just advising.

Ugh, this is nearly as bad as Dan Quale claiming "America is the envy
of the rest of the world", in particular with reference to Europe your
claim is much to broad to do justice to the diversity of political and
social systems (and incomes) that exist in Europe.

>I'm sure the European preference for colour is just as great, but
>the *relative* cost is higher. Same for other toys like CD players.

I don't think this is true, for most people the problem is that they
only want to have/can afford ONE monitor, not the difference in price
(about 20% more for a 1040ST and 10% for a Mega 2). Since the ST does
not have such a `games machine` image here, people tend to buy the B&W
monitor, mainly because it's much easier on your eyes (and there is
quite a lot of stuff here that only runs on a B&W system).

Matter of fact I've always wondered why people in the US put up with
such things as Mac screens, 50 line displays on the ST, the gastly
default Apollo workstation font, low resolution colour monitors etc.,
perhaps there's a US-optician Mafia? :-)

>--
>Paul Close paul@cacilj.CTS.COM ...!{uunet, ucsd, crash}!cacilj!paul

A Mega 2 does not have another 1 meg bank. It uses 16 1Mbit chips which
is 2 megabytes of ram.
Each bank has 16 places for ram chips. Chips can be 64K, 256K or 1M bit
A 1040 has 32 256K chips...adding this board in allows you to use either
256K or 1M bit chips in only one of the banks while the other take only
1M bit chip.....so a bank with 256K chip and another bank with 1 M chips
gives 2.5M

Hi ya all.... I am planing to buy an Atari ST rank computer, and want to
ask a few questions, any comment would be appreciated!

What's the average price for (each) the Atari 520, 1040, Mega 2 (2 megs one),
DSDD disk drive, color monitor, monitor/tv (for 1040 or Mega 2)?

Also, what's average price for the package deal?

520/DSDD drive/Atari Color monitor $????
1040/DSDD drive/ATari Color monitor $????
and Mega 2/DSDD drive/Atari Color monitor $????

thanks in advance!!!

From: cochrane@spot.Colorado.EDU
Message-ID: <3918@boulder.Colorado.EDU>
Source record: 250446

A friend of mine has sold his ST and wants to sell the ST software programs that he still has. He also has a couple of pieces of hardware to sell. He is willing to take best (reasonable) offer for these. Here is the list:

SOFTWARE Sale Price

Balance of Power (color system) $25
Flight Simulator (color) 25
High Roller (color) 25
Time Bandit (color) 20
Sundog (color) 20
Flash* 12
Degas* 15

142

I believe he intends to give a discount if you purchase all of the packages listed above (Talk to him about the amount.). All software has been rarely used and includes all manuals and original boxes.

*These items include the original registration card (which he never got around to sending in).

HARDWARE Sale Price

Packard Bell 300/1200 baud modem $100
Citizen MSP 20 printer with parallel
and serial ports 250
Macintosh 64K ROM chips for
Magic Sac & 10 disks of
MAC PD programs 40

The modem and printer were also rarely used and are both in excellent condition.

BOOKS

Compute's 1st Book of Atari ST $7
Compute's St Artist 7
ABACUS Gem Programmer's Reference 8
Graphics & Sound 8
Tricks & Tips 8

38

A discount is also available on purchase of all the books listed above.

MAGAZINES WITH DISKS

Start 5 vols $20
Compute ST 8 vols. 25
ST Log 3 vols. 10

55

His name is Samten Nagarajan. He can be reached at:

> properly with the blitter chip, perhaps aborting a blit in the middle.
> The problem occurs with both TOS 1.2 (the Mega ROM) and the new
> Developer's version of TOS 1.4.
>
> Has anybody seen this problem before? Do I have a bad blitter chip, or
> is the problem systemic with all Mega's?

Yes, i had the same problem. Dragging a window very fast from left to right
and back left a lot of vetical lines on the screen. I think it has something
to do with the accessories you have installed. When i used ALARMCLK and some
ramdisk, the problem occured. Now i have a different configuration and i have
never seen these symptoms again.
I have a Mega ST4 & SH205 and now with the following Programs in exact this
order in the AUTO-folder:
ETERNL3
TURBODOS
FOLDERxxx
IDLE12
Acessories:
Mouse Speed (Speed up the Mouse)
Extras (new File Selector Box)
ROCP
MemFile! (1.4)
I hope this will be of some help.

From: tnphhbu@dutrun.UUCP
Message-ID: <509@dutrun.UUCP>
Source record: 250449

Somebody must have tried this before. I have a 1040 with 20 Mb HD.
It is connected over the RS323 to a larger SUN system, at 9600 baud.
I think with 9600 baud I can make a backup at night. (9600 baud, say
500 chars/second, so 30k/minute, 2M/hour). Now how do I do it ?

I can make an account on the SUN that has only kermit (or whatever)
instead of a shell, so it would be safe. If I had a script on the
atari that would pass all files to kermit, plus some directory
information, and another script to restore things....

Any good ideas ?

Thanks in advance,

> lost experience. This may be a feature (but PC-Moria 4.83 doesn't
> do this!).

Some of these are bugs and some of them are features. My excuse for the bugs is that they're in things I never use; I'll try to do something helpful.

Shop contents are supposed to change when a saved game is restored; this is a very popular FEATURE. The use is that if you need a restore this-or-that potion and they're out of stock, you can save and restore. Shop contents should change more in proportion to the number of days between when the system thinks the game was saved and when it thinks it is now (This suggests a possible source of trouble: if the game thinks now is before the save time, because the system clock wasn't set...I haven't checked this, but I will).

The shell escape behavior is simply due to my ignorance. I had an example of how to execute a program and return to the parent; I followed it. I did try some fancier things, but they didn't work. I'd LOVE to get examples (email please, I'm going to be away for a while, and postings may expire) of how to do better things.

The behavior of restore life levels potions is in response to the famous 'grape jelly trick', of draining nearly all your experience, then restoring it to maximize the benefit of any stats which have been raised. It is definitely a feature, and is new to 4.87.

Today I have US mailed a disk of arced, uue -500 moria sources to martin@lakesys, along with a slightly fixed version of moria (the executable) and the ST curses package, which is fairly widely available, but not on the lakesys list. I have no idea what will happen as a result. The fixes are that upper case option letters are accepted, and that messages are displayed while a character is resting. As I said, slight.

If you run an archive which can be consulted either through a mailserver (like netlib@lakesys) or by allowing essentially unrestricted public access (like killer), and if you want any source or executable of umoria for the ST from me, I will gladly US mail it at my expense. Anyone else (including those who run ftp-only archives) can get the same service by sending me a DSDD disk, a mailer and postage. I am intentionally not publishing my mailing address, because I like to chat first. Please email me at chinet. chinet is chinet.chi.il.us (I think), and is known to many systems including killer, ulysses, ddsw1 and nucsrl.

I have been asked for a version of ST moria which will run in a door on a bbs. I'm trying, but success is not guaranteed. If anyone gets one to work, please let me know.

Thanks to CrackerJack, who sent me a picture postcard as per the request in the moria distribution. The first.

5901. clock cartridge

Newsgroup: comp.sys.atari.st
Date: 1988-10-12 14:39:21 UTC
From: scarlett@watdcsu.waterloo.edu
Message-ID: <5142@watdcsu.waterloo.edu>

I am looking for a clock cartridge for my 520 (for time stamping, etc)

I need something cheap yet satisfying :)
Any suggestions re:makes and models?

As I do not read this group regularly, please use email.

Many thanks

From: jpd@aiva.ed.ac.uk
Message-ID: <617@aiva.ed.ac.uk>
Source record: 250302

Does anyone have any example srcs of MFP timer interrupts. I want to be able to use a Un*x-style alarm function and would be grateful for any information.

Whilst Ive still got my begging-bowl in hand - does anyone have any detailed information on the Line A functions/variables....I have Abacus "Internals" but it is incomplete and in many places, wrong.

I have heard say of the SALAD document but as far as I can make out, it is just for developers.

Thanks 10^6

(Gee, I haven't posted in a while...)

Yes, there is a Spectrum digitizer for the ST (How do you think Antic gets their nifty Spectrum pictures for _The Catalog_?)

Trio Computing (you know them, they wrote Spectrum!) has independently released DIGISPEC, which is supposed to give your Computereyes digitizer kit Spectrum-scanning capabilities. I don't know much else, short of that it exists (yes, I saw the package at my local store), but here's something for you to chew on for a while.

in article <2669@ihuxy.ATT.COM>, nowlin@ihuxy.ATT.COM (Jerry Nowlin) says:
> I'm in desperate need of a program that will preview PostScript. I'm real
> tired of walking down the hall to the printer every time I want to test a
> piece of code. Is there a way to run the Mac programs that display
> PostScript with the Spectre?

I've never used any of the Mac PostScript preview programs so I
can't say I'm 100% sure if they will run on the Spectre 128. The odds
are that they will run with no problems. The *only* problem I know of
with the Spectre and PostScript is that you can't use an Apple
LaserWriter, all the drivers expect an AppleTalk port that the ST
doesn't have. Several possible solutions are being checked into but I
won't even guess if they will work or not.

If your interested in using a single program you might try
asking Dave if he knows if it runs or not. He has a lot of Mac software
and he also gets reports from all the users. You can reach him at
hplabs!well!dsmall. He usually gets on there about once or twice a
week. As an alternative you can send me an email asking about a specfic
programs, as long as the volume of requests is reasonably small I'm
willing to answer questions. I may not be any faster than emailing Dave
directly though.

In article <Oct.11.19.48.57.1988.7522@topaz.rutgers.edu>, balsley@topaz (John Balsley) writes:
|
| I have been using Spectrum 512 for quite some time now, and I
| think the graphics are outstanding. I was wondering if there is a
| color digitizer out there somewhere which works with Spectrum or at
| least stores pictures in Spectrum format to capture the full color
| capabilities of the ST. Does such a thing exist for either Spectrum
| or any of the other 512 color graphics/paint programs currently on the
| market for the Atari? Any information would be helpful.

I have used the "Digispec" utility from Trio Engineering (the people that wrote Spectrum 512), which allows me to use ComputerEyes with Spectrum 512. I find it satisfactory, although the best pictures are made with separate R-G-B passes, rather than one fell swoop in composite color.

The user interface for Digispec is much like the interface for Spectrum 512. If you like one, you'll like the other.

Digispec allows me to diddle with dithering to get "in-between" colors at the expense of image crispness, and RGB offsets to adjust for bad lighting or special effects. The raw RGB captured image can also be stored for later diddling (if I have disk space :-). Digispec also translates GFI images using the same user interface... really nice for importing pictures from that "other system that starts with an A" :-).

Message-ID: <9989@cup.portal.com>
Source record: 250306
Cross-posted to: comp.sys.atari.st,rec.music.synth

Ralph -

As for choosing a MIDI channel to avoid interferance w/ instruments,
I'd say the simplest way would be to allow the net to operate on ANY
channel (or even break the net into zones using channels), but encode
all network communications as SYSEX blocks. The are a lot of SYSEX id's
not yet assigned (confer Intl MIDI Assoc. data). This would serve to
encapsulate the communications in an isolated pseude channel, where
the contents of the SYSEX block is *entirely* up to the network community
to decide upon; the only restriction being that only 7-bit data is
allowed within the block...

5907. Volume Labels under TOS 1.4

Newsgroup: comp.sys.atari.st
Date: 1988-10-12 19:44:39 UTC
From: apratt@atari.UUCP
Message-ID: <1188@atari.UUCP>
Source record: 250307

After careful consideration, and some input from a couple of people (including credit to Kbad for the ultimate solution), I have reworked volume label handling in TOS 1.4.

Originally, I dropped volume labels entirely: if you tried to Fcreate a file with the volume bit set, you'd get a regular file. Then somebody complained about that, and I changed it so the Fcreate would fail.

However, I became convinced (thanks to Michael Fischer, among others) that this was bad: the only way to create volume labels would be by using Rwabs, and it is impossible to do that safely: if any of your parents has an open file on the drive, calling the "cause media change" procedure I provided would be a disaster.

So I decided to make them work at least as well as before, and hopefully better. See for yourself.

-- Allan Pratt

======= CUT HERE FOR APPLICATION NOTE REGARDING VOLUME LABELS ========

10/11/88: volume labels

The behavior of GEMDOS with respect to volume labels has been changed.

First, here's the new behavior:

1. The only available operations on volume labels are Fsfirst (if bit 0x08 is set, you'll see 'em) and Fcreate.

2. Fcreate(file,0x08) will create a volume label IF the 'file' ends up in the root directory of a device. Otherwise you get EACCDN.

3. Once you Fcreate a volume label, you should Fclose the handle immediately. This is not enforced, but any data you write to the handle is lost forever.

4. Before the new label is created, any label on that device is deleted. (Well, specifically, the first file in the root directory of the device with type == 0x08, if any, is deleted.)

5. You can create a volume label with the same name as an existing file, or vice versa. Both will coexist just fine on the disk.

6. You can't Fdelete, Frename, or Fattrib a volume label.

7. You can't use Fattrib to make a file into a volume label.

8. You can't remove a volume label. (But see #4: you can
rename one simply by creating one with the new name.)

In the old GEMDOS, people sometimes did this to create a new label:

```
Fsetdta(&dta);
if (!Fsfirst("\\*.*",0x08)) {
/* a label already exists: delete it. */
fd = Fcreate(dta.name,0);
Fclose(fd);
Fdelete(dta.name);
}
fd = Fcreate("\\mylabel",0x08);
Fclose(fd);
```

This sequence works because Fcreate'ing a file with the same name as
the label would remove the label. Then you could delete the file.
Having done that, you know the last Fcreate will be the only volume
label on the disk.

Well, this sequence will still work. The clause which checks for and
deletes an existing label is not needed, but harmless. The last Fcreate
will replace the old volume label with the new one.

In the old GEMDOS, the above algorithm will wipe out an existing file
which has the same name as the NEW label. In the new one, it will wipe
out a file with the same name as the OLD label. The advantage of the
new GEMDOS is that you don't need the first clause at all: just Fcreate
the new label, and you won't wipe out any files at all:

```
fd = Fcreate("\\mylabel",0x08);
Fclose(fd);
```

This works whether you already have a label or not, and whether you have
a file called mylabel or not, and it doesn't wipe out that file if there
is one.

Of course, since programs should run on any system with any ROMs,
and you should do error checking, this code will work best:

```
/*
* Program to change a disk's volume label.
*
* Should be run from the volume's root directory. The single command-line
* argument should be the new label to create. Any old label is removed.
* Works for all ROM versions, both pre- and post-TOS 1.4.
*
* This code is for Alcyon, but should compile under almost all ST compilers.
*
* Written by Allan Pratt, of Atari Corp., October 12, 1988; released
* to the general public to be freely used and copied with no restrictions.
*/

#include <osbind.h>
```

```
int romvers;
long mklabel();

main(argc,argv)
int argc;
char *argv[];
{
long oldssp;
int *sysbase;
char newlabel[12];
char pathbuf[128];

oldssp = Super(0L);
sysbase = *(int **)0x4f2;
romvers = *(sysbase+1);
Super(oldssp);

Dgetpath(pathbuf,0);

if (*pathbuf != '\0' || /* must run from the root directory */
argc != 2 || /* expect exactly one argument */
argv[1][1] == ':' || /* which must not have a drive spec */
index(argv[1],"\\")) { /* ...or a path spec */

Cconws("Usage: label <newlabel>\r\n");
Cconws("Must be run from the root directory,\r\n");
Cconws("and <newlabel> must be a simple file name.\r\n");
Pterm(1);
}

/* copy the argument because Fsfirst will overwrite it! */
strcpy(newlabel,argv[1]);

if (mklabel(newlabel)) {
Cconws("Failed.\r\n");
Pterm(1);
}
Pterm0();
}

/*
* mklabel: this procedure creates a new volume label on the current drive,
* replacing any existing label. The current directory must be the root
* of the drive you want to create the label on, and the argument must
* not contain a drive or path specifier.
*
* (Those restrictions are not demanded by Fcreate; they're demanded
* by the section of code inside "if (romvers < 0x0104)" because that
* way Fsfirst("*.*",0x08) will refer to the same drive & directory
* as the label you're trying to create.)
*/

struct _dta {
char reserved[21];
```

```
char attr;
int time;
int date;
long size;
char name[14]; /* null terminated */
} *dta;

long mklabel(newlabel)
register char *newlabel;
{
register long err;
register int fd;
extern int romvers;

/* If earlier than TOS 1.4, delete the old label. */
/* Assume that romvers has been set elsewhere. */

if (romvers < 0x0104) {
dta = Fgetdta();
err = Fsfirst("*.*",0x08);
if (err == 0) {
/* An old label exists: create a normal file with */
/* the same name, then delete that new file. */

if ((fd = err = Fcreate(dta->name,0)) < 0)
return err;
Fclose(fd);
Fdelete(dta->name);
}
}
if ((fd = err = Fcreate(newlabel,0x08)) < 0)
return err;
err = Fclose(fd);
return err;
}
```

Hum,

I have heard about this problem from several ppl but I have no idea how
to solve it.
Perhaps it helps you, if I send the whole sources (>250kb) to comp.sources.
atari.st ?

This error message is sent only, when one of the mallocs fails.
This is due to low memory only.
So either Gulam needs too much memory or Gulam gives a junk command line to
Xprolog.

Please note that I will not give anymore support for Xprolog.
(In fact it has expired from my harddisk about a year ago)

Andreas Toenne (Author of Xprolog)

Well, I have had a good bit of feedback on my vote request. While most replies said that they wanted them posted to the net, many didn't want them posted, some preferred mail, and very few were actually opposed to getting them through the mail. This and the fact that my posting of the mags to the net take up a full 2% of net activity (I made the top 20 :-]) led me to decide to try mailing them. I have never tried a mass mailing of this magnitude, so I would appreciate any tips (I am using a Vax running BSD 4.3). If you would like to be added to the mailing list, send me mail with a good return path and (ZMAG/ST Rep/both). If you have send me a vote, you don't need to send another request. If this doesn't work out, I may have to go back to a net posting. I hope this is a satisfactory solution for everyone.

Gary Duzan

From: davis@ux1.lbl.gov
Message-ID: <1112@helios.ee.lbl.gov>
Source record: 250313

Hello,

My atari recently began having problems and I took it in to
a local shop. I was told after about a five minute cursory
examination that it would need a new motherboard probably and
the best thing I could do was send it in to ATARI with $95
dollars and exchange it for another 520. Apperantly the
520 (old model) is no longer produced.
This seems fine but I am concerned about getting
a ``reconditioned'' 520. Has anyone had bad experiences
with the trade in? Would I be better off doing something
else (perhaps getting a new mother board from atari and putting
it in myself) will I get back what I sent them? I am concerned
about sending a computer which worked fine until three days ago
to the great computer graveyard at Atari. I would like to hear
from anyone who has had experience with this service...

>I sure hope that Atari will bring out this Transputer. Descriptions of it
>have been floating around Usenet (and bbs') for about a year now. The
>previous message mentioned it being released in Britain. Will it be availabl
>in the US any time soon?

The "Atari WorkStation" (the new name, since ABAQ is already in use) is
expected to be available for shipping in England by the end of this year.

The "Under $5000" workstation will now cost $8500 (U.S.) with one transputer,
with optional cards of four more transputers available. The operating
system on the "AWS" will be Helios...

Neil Harris explained that the transputer based workstation will be sold
exclusively in England first because they designed the transputer chip, and
are most familiar with it. (I guess he means that the 68000 chip in the
ST was designed in Germany, and that they're most familiar with it, too..)

Do the Magic Sac users out there know how to print their Mac Postscript files on a PostScript Laser Printer? It's easy once you know how, but there are a couple of tricky bits which had me hung up for awhile. I've therefore decided to offer a short tutorial. I assume that the information is equally relevant to Spectre 128 users.

The first step is to get a LaserWriter driver installed in your system. The trouble here is that the system tries to prevent you from doing this unless you have AppleTalk turned on, but, if you turn on AppleTalk, you will crash instantly. In my experience, the DA "Chooser" is very strict about this. The same is true of the old DA called "Choose Printer," as long as you attempt to install a modern version of the LaserWriter driver. However, if you use Choose Printer in combination with a really old version of the LaserWriter driver [mine is called Version 0], the installer checks only the NAME of the driver. So, if you rename the original driver to anything but "LaserWriter," you can install it with Choose Printer.

The next step is easy: follow the normal steps you would take to print a file, but, as soon as you click on the "OK" button in the Print dialog box, hold down "command-f" (i.e.,"control-f" on your ST). Instead of an attempt to print to the LaserWriter, a text file of Postscript commands will be written to your default disk under the name "PostScript" [an existing file called "PostScript" will be deleted, so you need to rename it first].

Now, you can't send this file to a PostScript printer, since it includes calls to procedures that are defined elsewhere. In fact, they are defined in the file "Laser Prep," a fact that need not concern you except for the fact that you won't be using this file and therefore don't need to have it on your disk. Getting the actually PostScript text files out of Laser Prep is not so easy, since they are buried somewhere in the resource fork of that file. Instead, do what Mac users who want to print PostScript over a printer that isn't connected to AppleTalk do. That is, find a copy of the Laser Prep text somewhere. These files are usually known as PostScript headers and are floating around the nets.

The trouble here is that, at some point in history, the modern Laser Prep files became incompatible with the old Laserwriter driver. Since you [and practically no one else in the world] are using the original driver, you need to locate the original header. Fortunately, the good folks at Info-Mac and Macserve are taking care of you, and a version of that file is still archived under the name LASERWRITER-HEADER.PS. Fish down this file, and you are ready to go.

Almost. The archived file (at least, the version on MACSERVE@IRLEARN) has a missing line that can cause you all kinds of grief to track down [believe me]. Find the section of the file that goes:

```
{eofill}
{eofill}
{newpath}
{eofill}
```

and duplicate the last line, so you have:

```
{eofill}
{eofill}
{newpath}
{eofill}
{eofill}
```

Now you're all set. Just PREpend the header to the "PostScript" file generated by your Mac, and print on any PostScript printer. It ought to work on any; I can only verify that it hasn't given me any trouble on a DEC PrintServer40 attached to our local VAX. I've printed various sorts of text and graphics without difficulty. Occasionally, the output will look a tad different from what you would get from a LaserWriter using a modern printer driver, but the difference (as far as I have seen) is slight.

The normal LaserWriter routine includes the permanent installation of the header during the first print job; subsequently, the header does not need to be resent. The header I've recommended does not install itself and hence needs to preceed each job. For my purposes it makes very little difference, since the header resides on the VAX, and only the LaserWriter output needs to be sent over to the VAX each time. If you want to risk offending other users of the printer, the header includes some commented-out lines which presumably order the header to be retained in RAM.

I realize that this sounds like a lot of instructions, but, once you have everything set up and have a command file to carry out all of the steps, it's a pretty simple process, and the results are highly satisfactory. I hope you find it the same. Good luck.

I add: only if it's an ascii printer; a Postscript laser would choke a MIDI net. And I thought the centronics port was two way (with a proper xbios call).

A MIDInet would never pass muster as a real net, but it is a cheap step up to one. You could implement mail, and net based games :) and other useful functions. You could also do file transfers relatively quickly without having to rig up a null modem. 3.5KB/sec is not exactly inconvenient if it is done only occasionally.

Now all we need is a standard ;-)

The following is (again?) the system() function from dLibs. It uses the
_shell_p system variable, if possible, and then tries the SHELL environment
variable, followed by trying to forkXXX() the program directly, using the
PATH environment variable to find the program. As an aside, the 1.2 release
of dLibs is a couple of weeks (if that) away. This release will coincide
with the release of Sozobon C (public domain, GOOD, and MUCH smaller than GCC).

```

5921. STadel systems

Newsgroup: comp.sys.atari.st
Date: 1988-10-13 12:35:00 UTC
From: euloth@dalcsug.UUCP
Message-ID: <149@dalcsug.UUCP>
Source record: 250321

I seem to have an intermittent problem with the STadel 3.3 system. I am using an unmodified 520ST with Floppies. Now when I originally converted to the 3.3 back a few months ago, the conversion went fine, from the 3.1g. Then a week later, I tried to do a reconfigure, and the system would hang up after the configur.tos program got my reply to the question asking if I wanted to wipe the room, floor, log, or message files. always answered in the negative.

I somehow got it going again. Well last night it happened again. Now I made NO changes to the ctdlcnfg.sys file at all. I booted the system and it got as far as clearing the screen. Then it hung. I hit reset and since there was no CTDLTABL.SYS file, I went to re-configure. It hung as described. I got a new copy of the configur.tos program. Still the same thing. Copied each of the files and they all seemed to copy fine. REally strange. Does anyone have any solutions? Help!

Thanks in advance.

George Seto

Yes, keep posting the picture format info!

I first implemented programs using that information from your first posting quite a while back. I have saved the newest version in an "info" area and have kept up with the postings every time. I have found the info gained from neo and degas files invaluable. Keep up the good work as it is a very good use of bandwidth (better than this posting for sure), much better than some of the extraneous stuff than gets posted here (including mine). This is a lot of very useful info in a relatively small amount of space.

Highly doubtful. Dungeon Master has an incredible protection scheme.
Last I heard, no one could figure out how to copy or "crack" it with
any degree of success.

One other thing, shut up. You obviously don't know much about Dungeon
Master. The booklet that it comes with does not include maps or spell
lists. Asking for them is a perfectly valid and legal (if cheating)
posting to the net. I bought my copy, maybe if you'd bought your you'd
know such things...

>And one last thing: It's unwise to announce software piracy over
>the net -- and even less wise to pirate in the first place.

I think you have those two mixed up, but you're on the right track.

Waitasecond!

The man asked for Maps and spell list -- NOT instructions. I'm not sure if
you played DM, Anthony (can I call you Anthony? We haven't been formally
introduced B-), but I have. The only place to get maps and spell lists are
from other experienced adventurers who have finished the game.

I'm afriad you've been found guilty of jumping to conclusions, and for
turning an innocent request into unbased criticism.

>Geez, just buy it! You can get it for <$30 from almost any
>mail-order software house.

Yeah! Great game, and at that price, even. FTL could have probably charged
$50 a package and still sell millions, but they kept the price down and made
all of us happy.

>And one last thing: It's unwise to announce software piracy over

Dungeon Master is still an unable to be broken copy protection scheme,
and yes I do have an original Dungeon Master disk. Do not assume that someone
pirates something simply because they do not have the documentation. I, as
a college student happen to be borrowing the disk off of a friend who did not
bring his documentation from home. Therefore, the flame someone on the net set
up on me assuming that I pirate and freely express this is totally invalid.
I hope I have made a point here - and one last thing, the people who
complain about people pirating are often the ones who pirate the most
themselves.

clio has the sources and executable for TeX, along with some PK format
font files for the screen previewer, and .FMT and .STY files for LaTeX.
It does -not- have the DVIST screen previewer or anything to let you
print DVI files on either an Epson or a laser printer. The read-me files
along with these mention repeatedly that DVIST and the Epson printer program
are both available "elsewhere".

Could someone please explain where I might find these?

Without either a DVI viewer or a printer driver, TeX on a ST is a bit
useless, since you have to upload your DVI file to another system to print
it or read it. You might just as well upload the TeX file and TeX it there...

There was a recent issue of ST Express which focused on Dungeon Master. It
included maps and (I believe) spells. If you can't find it, maps and spells
are available on most public bulletin board systems. If all else fails, the
company that makes Dungeon Master (FTL, I believe) has a book out - 'Guide to
the Dungeons' or something similar. I hear the book basically reveals all,
but have not purchased it myself. Why bother, after finishing it unaided?

>Translation: Could someone tell me how to use my pirated copy of

Pardon me, but I saw nothing in his post that implied he had pirated
the software in question. There is no spells list in the Dungeon Master
package, nor are there maps. I suggest you research your facts in the
future before flaming publicly. And yes, I own the package.

Another way to get back at dishonest/shoddy mail order merchandisers is to write the magazines they advertise in.

I had problems with a now defunct mail order house that advertised in COMPUTE! magazine. After several frustrating months, I wrote COMPUTE!.

A few weeks later I got a call from COMPUTE! saying that they had checked into the problem, and a refund was on it's way. Two days later, I received my refund from the mail order house!

If you hit the vendor where it hurts, you often get results!

Another remedy to the "They charged my card, but I waited 9999 weeks before the product showed up..." problem is to order COD. You pay a feeS&d&~, but if your order is several hunderd dollars, the fee is less than 9 weeks of interest on your money!

Just hold on a sec before jumping to conclusions, pal. J.J.
is asking for something which does not come included with Dungeon
Master! (The whole idea being that it's supposed to be FUN spending
many days trying to uncover these spells on your own. Yeah right).
He's not asking for the documentation to a pirated game. Methinks you
were just a tad hasty in jumping onto your high horse.

5934. Re: Mail order blues/guide (LONG)

Newsgroup: comp.sys.atari.st
Date: 1988-10-13 20:06:20 UTC
From: stowe@silver.bacs.indiana.edu
Message-ID: <2433@silver.bacs.indiana.edu>
Source record: 250334
Cross-posted to: comp.sys.amiga,comp.sys.apple,comp.sys.atari.st,comp.sys.cbm,comp.sys.ibm.pc,comp.sys.mac

This is getting cross-posted all over creation, so please, if you have a follow-up that only belongs in one group, edit that newsgroup!!! Please!!

With reference to problems with mail order, I'd like to offer a (not too) brief statement in defense of dealers. Please note that I am part-owner in a small store, fairly new, and pretty much limited to the Atari ST and Mega. This post may be a little biased, but I also try to look at it from the side of the consumer, especially the "average" consumer who is not a power user, not a hacker... just someone who uses a computer.

Is there a place in this world for mail order? Probably. But... please remember that just as you expect to earn a living from your job, your dealer's job is the store he/she/it runs and the services provided to you, whether those be consultation or repair type services. If you come to me and use my services (e.g. trying out my software, asking questions, having me track down products and in general just picking my brain), then go buy from mail order because the price is cheaper, you have in effect stolen from me. You have used my services, my knowledge, my software, but have not paid for them. I think we all would agree that it just simply isn't fair. When you buy a product from my dealership, you aren't just buying a product. You're buying my support. You're buying my education. You're helping to repay the money we spent to become an "authorized" dealer if we are one (and believe me, that's no small sum!). You're buying the opportunity to come into my store and try out new software before you purchase it to make sure it's what you want. Many times we've opened packages for people to "test drive". Many times they have bought them. Many times they haven't. That's okay. It's part of being a dealer. Sometimes someone comes in ready to buy an expensive program, but when I talk to them about their needs, the program they're looking at is overkill, and I can recommend another, less expensive or less complex package. That's okay, too. As a dealer, it's my job to provide the best service I can to my customers. If I give solid and responsible advice, my customers are going to come back when they need something else. If I make a half dozen long distance calls to find some obscure book, that extra half-mile I've gone will pay off in a loyal and satisfied customer. If I've done my job well, I will be rewarded with recommendations from satisfied customers. If I've done my job well, I deserve to be paid for it.

It's okay with me if you buy mail order, but please don't expect to come to me if you have problems with it, or if you want to return it because it doesn't do what you want. Please don't spend 3 hours with me some evening asking me everything I know about it and then not buy it from me when you buy it. Please don't ask me to try to train you in how to

use it the way you need to. And don't expect me to drop other (read: paying) customers when you walk in the door and be exceedingly friendly or helpful. I can't afford to run a not-for-profit dealership. I have bills to pay, too.

The reason mail order places can sell things at the prices they do is because they don't have to spend 3 hours (or more!) talking to you about the software/hardware trying to make sure it's what you need/want. They don't have to have machines available to let you try the software. They don't have to maintain a "pretty" store because it's required for an *authorized* dealership. They don't have to be there to answer the phone and spend time explaining how to set up the hard drive (printer, modem, monitor, whatever) you just bought because the manual can't be translated into a recognizable language. Mail order won't send you home with another copy of a software package because your disk drive refuses to read your original disk all of a sudden.

Mail order is great if that's all you need.

Please don't complain about dealers because they can't compete with mail order prices. We can't. But then, mail order can't compete with our service, either. We don't charge "list"... but we don't charge mail order. With a lot of luck, we may get into the financial "black" in about 18 months, but that's only for equipment, stock, etc. Taking into account the amount of time we have spent and will spend tracking leads, teaching, talking, reading, etc... well, let's just say it's a good thing we enjoy this... :-)

I apologize for the length of this, but I think it needed to be said. It's not meant as a chastisement or a gripe. There's simply more than meets the eye to retail sales. I probably stated it a bit more eloquently on GEnie, but then, I didn't have the phone ringing all the time and people in and out while I was writing that one. ;-}

Happy computing and support your local computer pusher!

That accusation boarders on slander. You are accusing this person of having committed a crime, in front of tens of thousands of people. And all because you misinterpreted his request.

J.J, if you have access to any of the commercial timeshare services, such as CompuServe, GEnie or BIX, the maps and spell lists (and hints and discussions etc..) are available there for the cost of the download. Also, there is a commercially-available hint book, which you can probably get from the dealer where you bought the game. If you would like more specific information about any of the services, e-mail me and I will be glad to send it to you.

For the sake of Mr. Lapadula, and anyone else who doesn't know, Dungeon Master does not *come* with "maps and spell lists", they have been compiled by users and widely circulated. Next time, Mr. Lapadula, you should know whereof you speak before making such a serious accusation. While I abhore software theft as much as anyone, impuning a person's reputation in a public forum, based on your misunderstanding of an innocent and legitimate request, is no less serious a matter. If nothing else, you owe J.J. Lehett a public apology.

Regarding a message requesting a Spell List and set of Maps for Dungeon Master, Anthony Lapadula writes:

>Translation: Could someone tell me how to use my pirated copy of
>Dungeon Master?

Not necessarially... even the original documentation with Dungeon Master is skimpy, and doesn't contain the information requested..

This is the realm of the "Hintbook"... I already send E-Mail to the original requester with info on how to buy an excellent hintbook containing all he asked for, and more... (the one I wrote, actually.. :)
A hintbook which is useless to pirates, as it doesn't give ANY info on how to work the game itself, only hints (and answers) on how to solve the puzzles in the game...

I agree though... Dungeon Master is such a great game for the price, it really should be well supported, by *buying* it...!

>"...translation: how do I get my pirated copy [of dungeon master]..."

Two things which ARE NOT in the book is a list of spells, and maps. These can be made as you go (assuming you don't forget something or miss something) since mapping is straightforward, and various scrolls give spells. The problem is that you might have use for a spell described on a low level early in the game. And some doors and things are well hidden.

However, both of these things (map and list) are in a book titled "The lost scrolls of mount annias" which should be $10-$15 and gives a lot more help than just the list and the maps.

Help
Somehow the comp.binaries.atari.st postings to here have been
messed up. We seem to get incomplete postings. The NetHack which
is supposed to be 14 parts, we only received parts 6-10. I have
tried sending Email to Steve Grimm, but it keeps getting bounced
back. I know it used to work before the summer. w3Can anyone
help? It would be great if I could find a complete path to get
directly to Steve, since I have a few things I want to send him
as well, but if Steve could send the missing parts as well. If not
maybe it will be available later at lakesys, I expect, but I would
rather find a way of getting the postings from Steve complete as
they come out. BTW the same thing seems to happen with the sources
as well.
Thanks.

I haven't tried your bug, but I would like to make some general comments
on Timeworks software.

>It's a decent program other than this, considering the price. Now, if they'd
>only answer their 800 number or their mail...

Generally I like the price performance of the Timeworks software for the
Atari ST. I have been using Swiftcalc, Wordwriter 2.0, and Data Manager.
Unfortunatly, they all are full of bugs. Most of the bugs have reasonable
work-arounds. Except for Wordwriter, they have made no attempt to
come out with new versions lately. Most of the bugs pop up when you
are using the program with a hard disk. Some of them are just dumb,
like Data Manager leaves the screen backgound colors at it's setting
when it exits.

What I would like to hear about from you folks, is Timeworks Desktop
publishing software any better? Even if it have a few bugs, I can live
with that, but if it is like the beta version of Pro PP, then I'll skip it.

I've been using EasyDraw for a couple years, with some updates. It has
some limitations, but is relativly bug-free. I guess I'm looking for
advice as to whether Timeworks Desktop Publishing is more useful for
newsletters and catalogs. EasyDraw is great for presentation overheads,
maps, and other technical diagrams, but multi-page newsletters get
to be a bear.

WRONG!

I know somebody who bought Dungeon Master and is looking for the same thing.
In DM you have to figure out the spells yourself and the maps certainly
aren't included. Soon there will be a DM hint book and at least at one time
there were maps available on GENIE. I don't own an ST and I never have used
DM, but I am sick of the self righteous noodnicks flaming people when
they don't know what they are talking about.

>remember that just as you expect to earn a living from your job, your
>dealer's job is the store he/she/it runs and the services provided to you,
>whether those be consultation or repair type services.

I agree! I just became the proud owner of an Atari 1040 ST system with a colour monitor. I purchased the system on Tuesday evening (at What's This, for Waterlooites and transplanted Waterlooites) and found that the monitor had a problem with the power supply (I assume that it was the p.s. since it would come on for a second, flash, and die). I brought it back on Wednesday at lunch and took possession of a replacement monitor. I tried it out later that night and found that the screen was extremely flaky and very inconsistent (sometimes it would come up with the white screen on powerup and sometimes not, as an example). I called the store an hour after they were closed and found someone there. They opened the store for me and gave me my third monitor. I brought it home and it worked perfectly ... for about 10 minutes. Then it started making an atrociously obnoxious noise that was unaffected by the volume control. After much investigation (including doing a quick run around the neighbourhood to see if anyone had started up their handy-dandy power saw :-)), I gave up and went to bed. The next morning, I turned it on. No noise. Refusing to believe that I was hallucinating, I brought it in to work that day and left it on to see if it would generate that noise again. It did after about 90 minutes. Bringing this monitor (now #3!) back at lunch, they tested it out ("Yep, that's a gross sound") and set up a new monitor for me. They hooked monitor #4 up to one of their store systems and tested it out all day. I picked it up at 5 p.m. and had a (finally!) fully functional system by that evening.

Throughout all of this, the dealer gave me no hassles and bent over backwards to get me a usable system. I went through 4 monitors in 2 days. Although I felt fairly frustrated at having spent so much money and not having anything to show for it after 2 days, I shudder to think of how long I would have been without my system had the same thing happened in dealing with a mail-order company!

BTW, this dealer has basically no local competition, so they didn't have any incentive other than to make me happy.

I have recently uploaded a version of the KA9Q TCP/IP package to netlib@lakesys.UUCP. The package is one I run at home for networking my ST on amateur radio TCP/IP through a modem to my radio. It does have a MIDI driver on it also though which can be used to support another link.
The package supports Telnet, SMTP and FTP as well as some amateur radio specific operation. Full source code as well as binaries and documentation are also at lakesys.
I have no doubt that this package as it stands will support networking of multiple ST as well as mixed systems (I routinely do file transfers, telnet sessions and electronic mailing with Macintoshes and PCs located in the greater SF Bay area).

From: ggf@js.UUCP
Message-ID: <101488084314@js.UUCP>
Source record: 250350
Cross-posted to: comp.sys.atari.st,rec.music.synth

We are looking at using the midi port between two STs. The speed of the midi port does make the midi less than fantastic for a network. However, what we really want is a way to get at files on a ST from another ST. How we are planning is to use UUCP software to get files. It will not be as fast as an ethernet connection, but for the price of midi cables and some software, we have easy access to files on two systems.

Something else we are looking at is using minix to distribute the operating system over the two STs. Minix was designed to be easily implemented as a distributed os, and Amoeba, software to do rpc, is available for the PC version of minix. Perhaps a little work would let us use the midi port to tie STs into one system. (* perhaps not :-) *)

5952. TT TT/X specs (rumour?)

Newsgroup: comp.sys.atari.st
Date: 1988-11-01 08:39:59 UTC
From: meulenbr@cstw01.UUCP
Message-ID: <252@cstw01.UUCP>
Source record: 250202

Hi!

Yesterday I had a brief glance on a german magazine called
"68000 ST magazin" or something like that.

They had a 2 page article on the TT and TT/X, together with a
functional schematic with the name Roy Good on it.

The specs were as follows:
Two different machines: the TT being the low entry model, the TT/X being
the Unix box. Only difference I saw wat that the TT had 2 MB ram and the
TT/X had 4 MB ram. The rest seemed alike.
The figures:
68030 processor at 16 Mhz
optionally 68881/2
Yamaha sound chip.
DMA port (ACSI)
SCSI port
MIDI interface
same multifunction chip
VME bus with 5 free slots (on all models?)
extendible to or with 8 MB (internally without using a slot).
Some slow lan (not a 10 Mhz Ethernet).
Monochrome monitor: 1280 * 960 pixels.
Als 6 or 7 different color res.
3.5" floppy wiht 2MB raw date (1.44 MB formatted)

Software (Unix box)
BSD 4.3
ksh
NFS
X/Windows

NOT PRESENT (despite all rumours)
Signal processor, A/D D/A converter

Delivery:
to selected developers: end '88
customer introduction: in Germany at the Cebit (March/April '89)

Unknown:
price
customer delivery

Miscellaneous:
The memory path to the video was 64 bit wide.

My questions:
Can someone (perhaps from Germany) supply additional info.

Will atari (Roy, Allen?) confirm/deny this? (And perhaps fill in the details)
Will there be a different tos/030, or will the same os run on both ST and TT?
Is this thing running tos 1.4 or should we expect another version soon?
Will this box be shown at Comdex/Fall?

Wrap-up:
I don't have any more info, so PLEASE don't ask.
I just scribbled this on the back of an envelope from the mag.

PS: anyone interested in bying a 1040 with 68020/68881 ??

5953. GEM for Sozobon C

Newsgroup: comp.sys.atari.st
Date: 1988-11-01 08:49:00 UTC
From: to_stdnet@stag.UUCP
Message-ID: <639@stag.UUCP>
Source record: 250203

From: thelake!steve@stag.UUCP (Steve Yelvington)

I've had a beta copy of the (free!) Sozobon C compiler for a month or so. I'm quite pleased with it, but it has one glaring deficiency: no GEM.

After drinking a mondo quantity of coffee, and with the help and encouragement of Dale Schumacher and John Stanley, I managed to get an AES library put together. I have not tested most of it, and have not yet implemented a couple of minor functions, but I do have dialog boxes working, the file selector popping up, resource files loading*, the menu bar displayed, etc.

I have not yet started coding a VDI library, although I have been doing some groundwork for it.

Since I am not a registered Atari developer, I don't have easy access to the information I need to complete this project. I've had to dig it out of the backs of various books and from a few public-domain source code and doc files that I've found.

I would like to appeal for some assistance. I don't want to reinvent the wheel more often than is necessary. If you know of any public-domain header files, documentation or other resources that would help me with this project, I would appreciate receiving them. I am particularly interested in anything on Line A.

Please do not send me anything that is proprietary, copyright, secret or otherwise improper for distribution.

When they (seem to) work, the libraries will be released as to the public domain, with sources -- none of this copyright stuff you see nowadays.

I already have Mark Johnson's libraries. I've been VERY careful not to copy any of Mark's code; my AES stuff works quite differently (and was derived from different published data). However, Mark deserves a hand for having published his work. Without his GEM library, I'd have assumed this project to be impossible, and without his C compiler, I'd have not learned the language in the first place.

---

*I'm using the DRI Resource Construction Set, which I purchased from Merlin-Computer GMBH in W. Germany. The blasted thing is buggy but usable.

Can domsomebody please post the Atari replacement policy, or the phone #
of someone I can contact at Atari. I'm beginning to get really annoyed.
If I don't get satisfaction from them, I'm going to trash my ST and get
an Amiga. The St's a great machine, but it's not worth the aggravation!
Three disk drives in less than 2 years and dealing with a multitude of
incompetent service centers is too much to deal with.
Why IS CompuClub in Framingham still an authorized dealer anyway?
Shouldn't their customers be warned that Atari gives them slow service
because they don't pay their bills? I think it's very unfair to all of
us who have been promised service in a week, and have had to wait close
to two months for repair because Atari fails to send the parts.
The other two places I went to on Massachusetts weren't much better. At
least Compuclub did finally fix my drive last year!

I would have mailed this, but there's some info I forgot in my last posting. The PC7 archive is available for anonymous ftp at him1.cc.umich.edu or 35.1.1.43, whatever your machine prefers. We have 32 Megs of stuff on-line ready for download.

My apologies to everyone I've kept waiting on the numerical address.

5958. Hard Drive Woes (was Re: Hard Disks versus 10 Mb Floppies)

Newsgroup: comp.sys.atari.st
Date: 1988-11-01 16:02:54 UTC
From: rjung@sal42.usc.edu
Message-ID: <1806@nunki.usc.edu>
Source record: 250208

(Okay, okay, this doesn't pertain to the ST, but I'm desperate for an answer!)
^^^^^^^^^
Since the subject of hard drives came up...

Two months ago, a buddy and me got together a 20 megabyte Seagate hard drive and an ICD hard drive kit for use with a 130 XE. We get everything assembled, formatted, and partitioned, and it all works wonderfully.

HOWEVER, after a certain number (we don't know how many) of drive I/O operations, the hard drive starts to buzz loudly, and keeps returning "device done" (directory scrambled?) errors. We can still access the data, but only IF we (a) reposition the drive ever SO SLIGHTLY, or (b) continually try to read/write the drive (It gets through...eventually). Obviously, this is a MAJOR pain in the butt.

Does anyone know what's wrong, or have a clue? Since a lot of net.st.people have hard drives (Us? We're 100% naieve), and/or used to work on the Atari 8-bits, can anyone help?

Please post or reply. PLEASE!

No. Atari only does replacements on units of the same model number.
(i.e. You send in a 520ST, you get a 520ST back..) We do not have any
type of upgrades on 520/1040 to MEGA computers.

> seem to be the preferred names.) A case is also nice to put around it, and

BMS only makes host adapters, they package the Adaptec controllers with
their systems. Anyhow, if one is using a SCSI drive, a SCSI controller
won't be necessary. If one uses an ESDI drive, the SCSI<->ESDI
controller is necessary (Adaptec makes one, the number slips my mind at
the moment.

> up a logical unit number on the SCSI bus. Ah well...)

I believe both clocks can be disabled (I know the Supra can) thus
freeing up a SCSI device number (*not* a logical unit number).

> Does anybody know what is the current cost to upgrade to the new
> version of Publishing Partner (Profrssional) from the old version?

I wouldn't buy Page Stream(PS) right now. Sotflogik (SL) just shipped version 1.0 of PS this week and the 'known bugs' list is over 24!! SL has indicated that another version would be shipped within 30 days. But, SL has lied to their pre-paid customers for almost a year about PPP (now PS), so I don't believe them at all.

PS won't use original PP fonts. New fonts must be created for PS.
PS won't read original PP documents. so, forget about using your past work.
All in all, I think that PS is a loser and should be avoided for at last six more months. I don't think that SL can make it a viable, reliable product for at least that time.

Of course these are just my opinions and you are welcome to ignore them!!

Source record: 250220

Greg Wageman says:
>... For $120 U.S. (and change) you can purchase
>just the developer's documentation, which contains the pinouts ...

Yes, that's true... but if all you need is that one connector pinout diagram, $120 is an awfully steep price to have to pay for just one page...

Especially in light of the equivalent information being published by Apple and Commodore/Amiga in $19.95-$29.95 books, available at just about any B.Dalton Bookseller.

I imagine too, the page with that Mega expansion buss pinout is stamped "Proprietary Information", so that it can't be uploaded on UseNet (or anywhere else)...

In some posting, Chuck McManis said:
> The rumors of the '030 box are amusing, but unless they bought out
> SCO or something they will have a darn difficult time supporting it.
> Contemplating NeXT and Atari competing is downright humorous. But to
> be completely serious, Steve Jobs has no intention of selling his machines
> to university *students* which is what Atari would like to do, rather he
> sells them to the faculty.

In article <3f4a3cf4.14e07@gtephx.UUCP>, covertr@gtephx.UUCP (Richard E. Covert) writes:
| I second Chuck's comments!! I worked at AT&T and helped design the AT&T 3B2
| and 3B5 computers (running UNIX of course). and the man power that went into
| those two computers is totally beyond any thing that Atari is capable of.

Well, now, don't sell old Uncle Jack and gang short. If you read
Cringely's column closely, you will immediately determine that the specs
he quotes for the '030 (AWS??) have two serious flaws: not enough
memory, and not enough disk space. These SHOULD both be easy to remedy
if the computer is designed intelligently, which is possible. SIMM
sockets for RAM and a useable SCSI port on the back of the machine
aren't that hard to stick in the box. It just takes money to make it
run.

Think of the difference in cost if the NeXT came with 1 Mb RAM instead
of 8, and without the optical disk. You've just bagged $3,500 to $4,000
of the system cost right there! Then you take off Steve Job's name, and
you're down to >>> $2000 <<< right?

| In fact, those 5 year old computers still have more horsepower then anything
| Atari is likely to produce. I worked for a year on the hardware and software
| of the 3B2 and can't believe that Atari will be better then Jobs.

A 3B2? Get real! A MicroVAX II (w/Ultrix) blows the 3B2 out of the
water, and the MV2 ain't no speed demon. AT&T should stick to building
phone switching equipment, but then of course, they have GTE do that for
them now, don't they :-) (BTW, I'm a fellow GTE* employee!)

| Oh well, maybe I will be wrong, because an Atari computer might be cheaper (in
| all meanings of that word) then the NeXT computer.

Yup, I'm sure it will. But then again, how many of us have $6,500 to go
plunk down on a computer today? On the other hand, how many of us can
scrape up $2,000, realizing we will need to add more memory, more disk
space, etc to be really pleased with the performance. It makes
decisions for Christmas, birthdays, etc. real easy. "My birthday? Buy
however many 256K SIMMs you can afford!" or "Gee, a 100 Mb SCSI disk
would sure look nice under the tree this year!" or "Pop, I'm taking

operating systems and software engineering both this quarter! I REALLY
need a tape drive to back up all this stuff!" :-) :-)

* GTE = Good Time Electronics, of course!

From: hakanson@mist.cs.orst.edu
Message-ID: <7137@orstcs.CS.ORST.EDU>
Source record: 250222

It's been a long time since a new version of UniTerm came out (since June by the looks of my archives here), so I thought I'd take the opportunity to remind folks that it's available for anonymous FTP at host "cs.orst.edu", in the directory ~ftp/pub/atari/uniterm. If you're not familiar with the setup there, get (and read) the README file first. Don't forget to set BINARY mode for the ARC files.

Also, please don't ask me to mail UniTerm to you, as I really can't afford the time or disk space for the plain-text encoded files. The author tends to ship it to the better known archive servers, so try those if you don't have FTP access.

I haven't tested the new version yet, but I have verified the integrity of the ARC file, so I don't anticipate you'll have any problems with it.

Many thanks to Simon Poole, for making such a first-rate piece of software available to us, and for paying attention to the many bug reports and enhancement requests I've sent over the years (Has it really been "years"? Time flies...).

^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^
> comment on this?

I will: Helios is just a UNIX look-alike, it isn't equivalent to
it (in my view). Why? Well, essentially, it's been designed to run on a
network of transputers and not the 68030!

Helios is a multiprocessor system, though it's *not* a tightly coupled
multiprocessor system (i.e. shared memory, etc) but rather a loosely coupled
multiprocessor system, each transputer is running its own (Helios-)kernel.
Communication is done via transputer links (If I remember correctly, 20Mbit/s).
Thus, Helios for the Atari could perhaps be compared to Mach (-> NeXT,
comp.sys.next) which *is* a *tightly coupled* multiprocessor system.

5975. Good news for Atari MC68881 users

Newsgroup: comp.sys.atari.st
Date: 1988-11-02 14:11:04 UTC
From: VBRANDT@DBNUAMA1.BITNET
Message-ID: <8811021410.AA11070@ucbvax.Berkeley.EDU>
Source record: 250225

Hello all,

I earlier asked about software support for the new Atari MC68881 floating-point processor board (remember, this is a Mega-only add-on). Well, here's good news:

After a long period of silence, Atari Germany now supplies software libraries for Alcyon C and ST PASCAL/+ (by CCD/OSS) at no extra charge. They include source code and a demo program for both compilers. While the Alcyon implementation is complete, the Pascal version lacks the basic arithmetic operations (+, -, *, /, **). This is due to the internal representation of real numbers in the compiler.

So, if you buy the FPU add-on, you'll be able to DO something with it! Special thanks to Atari for including the (assembler) source, this makes it much easier to change or expand the libraries.

I don't think it's the same software that comes with the 'SFP004 developers kit' that Roy Good told the net about a few weeks back. At least, Atari Germany credits a German author for the software.

I also called CCD, the makers of ST PASCAL, and they told me that there will be an update next year that incorporates MC68881 support. This update will cost about DM 70.- (approx. US$ 39). The guy on the phone wasn't able to tell me if basic arithmetic operations would be executed by the FPU in this update.

I don't have Alcyon C, so I can't say anything about that compiler.

>
> -- John Townsend
> Atari Corp.

OKAY, John I am convinced that Atari will work on the Diablo emulator.

<<< FLAME ON HIGH !!!!!!>>>
But, you have yet to answer my questions about why US Atari hasn't
developed and supported an Epson emulator for their laser printer.
There is not another laser printer out there (HP Laser Jet or otherwise)
that doesn't include an Epson emulator. so, why doesn't Atari release one??

and what about Ultra Script?? Is it ever going to be released?? UltraScript was one
big reason for me to buy the slm804.

My big concern is that Atari will drag its feet with the SLM804 and not release
working reliable software for it for a year or so. Atari has a very poor reputation
when it comes to system software support. Look at the 40 folder bug in TOS. TOS has
been out for years and still you have the 40 folder bug.

So, please tell me WHEN and tell me IF the Epson emulator will be released??

If you think I gripe about this you should talk to your dealers.
The SLM804 can't be sold in its present state of development. Or maybe you are
planning to discontinue the SLM804?? that would explain why Atari places such
LOW priority on the SLM804.

So, please push for the Epson Emulator, and fix the Diablo emulator. I am
willing to pay a reasonable fee for future software for the SLM804.

Source record: 250229

The good news is that Wizard of ST programming Charles H. Johnson has fixed MultiDesk 1.3 to work with the SLM804 diablo emualtor and its setup630 DA. And MultiDesk is super!! One of the joys with owning a computer is coming across fine software such as MultiDesk.

I highly recommend any and all of Codehead Software's products. I currently own MultiDesk, Top Down, G-PLUS, and ARC SHELL. All of them are worth buying.

Richard (Not ownded or operated by Codehead) Covert

ROMs are on quite long lead times. Naturally, we have to do ROMs for
production. However, depending on demand (which I expect will be quite high)
we may offer One-Time-PROM [OTP] kits, which I'd like to have include the
RAM-loadable version for those who want to experiment with it before
going to an 'approved service center' to have the ROMs changed.

[rest of posting deleted]
The only 'block diagram' that I have produced (via EasyDraw!) for the TT is one which was given to certain subsidiaries as a preliminary view of current architectural thinking at the time. Specs' have changed since that draft, so as I said last week, don't believe what you read in the press!!

As a VERY important aside, that diagram (as with all my similar documentation) was very clearly marked: "Atari Corporation - Company Confidential". Its reproduction is clearly a betrayal of that confidentiality, and of the trust with which I released it to the subsidiaries. I will certainly follow up on how this information could be published, and it must make you realize why I am so reticent to post or release ANY preproduction information.

It is no wonder that Atari, and others, get a poor image in public when journalists publish preliminary or confidential information which has every right to be changed without notification. I have tried to keep this net, at least, reasonably well informed without making details or schedules public which I do not feel certain are yet definitive.

Even if the information was obtained through apparently legitimate channels, I believe that the writer should by now be sensitive to the effect of publishing prerelease data, and should therefore have taken the step of verifying its accuracy and timeliness with Atari Sunnyvale.

I realize I may be having a stronger reaction to this than may be warranted, but I see so much traffic on the net spreading and modifying rumors which are unsubstantiated (and more than often flat out misleading or totally wrong). The energy which we expend in trying to straighten out the mess could be much more usefully applied in resolving some of the issues of product development and support which REALLY need addressing.

By all means read these articles, but please do not accept them as gospel (or whatever your personal religious equivalent may be) unless and until an official product announcement is generally released by Atari Sunnyvale.

re: EDST, C compiler and help

This is my first attempt at proper E-Mail, so if this is read by anyone I'll be amazed. Can I talk anyone into buying a copy of my editor EDST for the ST, its very cheap 12 pounds sterling, features include:
o 4 Windows open at any time
o Full GEM access
o Cut and Paste
o search/Replace
o Auto backup and cumulative editting time saved (option)
o Full MS-DOS like shell runs in a window, allows you to run compilers linkers etc. Full list of commands, including batch files with expression evaluation. I use it with Megamax C all the time, but Lattice et al should be no problem.

Address follows:

Robert Chafer (Chalm Software)
61 Southey Green Road
Sheffield
S5 8GU
England

Now for a few queries:

1. Does anyone have a full list of ST OS bugs, and how to get round them

2. I have a Citizen DSDD drive that keeps giving read errors and won't format past about track 70. This all seemed to stem from using PC-Ditto, which seems to really hammer drives.

I am currently writing a new C compiler based on the Turbo C style, this should retail at about 55 pounds sterling and should be the fastest compiler around. Anybody have any suggestions for features they would like? (any resonable offer considered). This will also be ported to the Amiga and the ST version should be around early next year ('cause most of it is written).

Has anyone out there in ST land had any experience with Turbo-ST the software blitter, I've heard it can be a bit flakey.

Robert Chafer

In Canada, Atari charges $125 for documentation, and $150 for docs with
support. I suppose that this means that they feel support is only worth
$25... (from the way developers talk about the quality of the documentation
on the net, you'd figure that it should be $25 for docs and $125 for support).

From: dal@syntel.UUCP (Dale Schumacher)

> Why use Sobozon C when Mark Williams C is available is and such a fine
> product at a great price?? You can buy MWC for as low as $125.

Well, for one thing, Sozobon is FREE. Secondly, it comes with SOURCE CODE for EVERYTHING. This may not be important to many people, but I feel a lot better about something if I have the source code, since that means I can FIX it if I find a bug, and I can understand it and learn from it otherwise. Thirdly, it generates better code than Mark Williams C. And finally, it doesn't create problems with the environment. These problems are not immediately obvious to the casual user, but Mark Williams C uses some very sloppy methods of passing long argument lines and information about the 'isatty()' status of file handles.

Mark Williams C is a very fine product in many ways, and is probably better supported (by the users, I've never liked the support I've gotten from the Company) than any other C for the ST. It is currently a better choice for projects that use GEM or floating point. I don't write many programs that use either GEM or fp, so I doesn't matter to me. Also, I got Alcyon C as part of the ST developer's kit (a LLOOOONNNNGGG time ago), and Sozobon has the final advantage of being upwardly compatible with all my old code.

I'd certainly be interested in an early crack at trying TOS 1.4, and I strongly suspect that a lot of sensitive users would regard this as a chance to try the new version to be sure it wouldn't break their important applications before commiting to it. I trust we may take the remark about going to 'an approved service center' as meaning that the upgrade will be done in the field without the necessity of returning the machine to Atari. I am a bit disappointed at the lack of an assertion that 'Atari will be in a position to announce the timing for availability of TOS 1.4 within at most x number of weeks'. I had the impression that results from the second round of beta testing were pretty much in, and that's frequently enough to justify making a pretty good schedule.

Yah, a 10-pound grain of salt, usually. It is obvious to anyone who knows much about Unix that V.3 on a 1-meg machine is going to be pathetic (even if they do manage to get it out). Have you looked at the price of RAM chips lately? If you buy the machine for 2K, you'll need another 3 meg of memory (about $1000) and 60-80 meg of disk space ($1000-$1500, for reasonable speeds) to make it useful. Still, $4500 wouldn't be a bad price for a nice little '030 machine. Like you say, wait and see if it materializes.

How do I know when it is an official announcement. Atari did never ever
send me something after sending in my warranty card, so I'll have to use
the press & Usenet to get info.

>
>Roy Good/Atari Sunnyvale

Some more:
I quoted one magazine, but saw several other articles in the (German)
press (with related info).

Fact is that we all know that atari is working on something with a 030 or
related.
Fact is also that they have a large? boot at Comdex.
(so perhaps something will be happening)
Fact is that Germany is very often well and early informed.

I'd suggest atari to stop the rumours by giving some info.
(If they really have a product out at comdex they must have some basic
info by now).

For instance, I for me have one question.
Will the -perhaps non-existing- 68030 box use tos 1.4, or are we to
expect another version of tos (and is that version compatible with the
68000 version). I'd really *want* a tos which could also run on my
68020!

Subject: Resource Construction
To: info-atari16@score.stanford.edu

----
I recently upgraded my TDI Modula-2 from a regular version to a developers
version. Included with the developer's version is a resource construction
program. According to the ABOUT dialog, this resource constructor is
licensed from Megamax. Unfortunately there was no documentation included
with the program. After playing around with it for a while, I managed to
make it useful. I have two questions:
```

1) When I create a new tree, the program always places it on a background box of the same size. No matter how much I play with it, I haven't been able to get that background box to change sizes. To create a new tree, I pull either from a MENU, FREE, DIALOG, or UNKNOWN icon. No matter which of those I choose, the background box is always the same size.

2) When creating a menu I can get a new TITLE on the menu line, but I can't seem to add any entries under a title.

Any suggestions would be appreciated.

<Geert J v Oldenborgh> writes:

>> ... Prospero Fortran and Pascal ...
>
>I have heard nothing but horror stories from users of these
>(not the latest version, though). Many bugs and slow. Use
>Absoft for Fortran, don't use Pascal.
>
^stuff deleted!

I'm using ProPascal and ProFortran for approx. 2 years now. Due to my positive impression I feel obliged to contradict Geert in his opinion concerning these compilers.

Many bugs ... Latest versions (i.e. 2.13) are free of fatal bugs, maybe they're still a bit rough around the edges. 2.11 had some bugs, yes.
... and slow Compiler front end is slow, linker is even

slower. But the code is quite fast:

I'm sceptical about compilation time enthusiasts. They all liked T*rbo Pascal 2.x and 3.x on the small I*Ms. They are totally happy about new concepts in Rev. 4.0 now, i.e. the modular compilation feature ("units"), for example. Well, Prospero compilers did it all the time ...

Prospero are the only ones who offer not only 68881-libraries but even 68020/68881-libraries for all their compilers (i.e. Fortran, Pascal, C). You just have to relink your programs, no source modification at all.

They offer a real language family. You may use Assembler routines in Fortran functions called by Pascal procedures referred to in a main program written in C and vice versa. Saves lotta time for a team of programmers, really:

Their interest in feedback from users is big, their hotline is as good as the rest of their service, as updates are free of charge, for example.

Summarizing, ProFortran and ProPascal are no tools to write quick'n dirty hacks, ok. But at least for any other, bigger job they're the best I know - up to now...

Disclaimer: These are the opinions of a satisfied customer - nothing more.

Subject: Disk Drives

Hello, I wonder if anyone could help me with a query from an ST owning son of one of my work colleagues? He's just picked up a Technomatic double 3.5" double sided disk drive (that's two double sided drives in one box!) for a paltry sum and wants to know if he can get it working on his 520ST. It's rigged up for a BBC Microcomputer (one of those strange things UK educational establishments favour) so it needs conversion but I imagine it"s probably

pretty standard IBM type. I figure there must have been articles published
on such conversions (I know there has been such an article for the Amiga)
- anyone got any ideas?

Thanks in advance,

- m a r c u s -

(ex info-atari8 subscriber, now i-amiga subscriber - no flames pleeeeeease!)

Subject: Screen dumps to the Deskjet printer
To: info-atari16@score.stanford.edu

I am getting a HP DeskJet printer for my 1040ST and was wondering if there
is any way to use the 'install printer' option from the desktop to do screen
dumps to the DeskJet. I am getting the Epson cartridge with it so will this
help? I do a lot of plotting of math functions using several different
plotting
programs that I then use the 'alt-help' screen dump to get a copy of. Will the
DJ accept these dumps? Any suggestions? Thanks in advance netlanders!

Well, I have been recieving some good response from people who have been interested in a St relay conference. However, and I take full responsibility for this, I forgot to mention the time zone, which many of you were quick to point out. Well, I see the best solution to this problem as the following - anyone who is interested, send me your opinion on the most appropriate time for you - if possible convert your time into Eastern Standard Time (U.S.A.), and then I will post what the results are, and hopefully we can get this conference idea rolling.

Thanks for the co-operation,

Taz

Date: 1988-11-04 20:01:05 UTC
From: cmcmanis%pepper@Sun.COM
Message-ID: <76253@sun.uucp>
Source record: 250155

In article Friesen%PCO@BCO-MULTICS.HBI.HONEYWELL.COM writes:
>Someone recently mentioned a 300MB hard disk was available for the ST,
>but I was told that an ST could only access 195MB on a hard disk.
>
>Can anyone comment?

Well not really. The original 68K GEM inherited the 32Mb hard disk partition limit from MS-DOS, there was also a sixteen partition limit once but I believe that it is now 26 (A-Z). So leaving A,B,C for the floppies and the cartridge a simple 32 * 23 calculation yields 736Mb, if it is 16 then you would only get 416Mb. Both numbers being larger than the 195 you mention.

6006. ST software For Sale

Newsgroup: comp.sys.atari.st
Date: 1988-11-04 20:59:26 UTC
From: cochrane@spot.Colorado.EDU
Message-ID: <4458@boulder.Colorado.EDU>
Source record: 250156

I've posted this ad before (I believe this is the 3rd time), but this time a couple things have changed. First, the prices are reduced from what I originally posted. Second, the friend for whom I am posting this will be out of town until the middle of January 1989 and has asked me to sell the stuff for him. I will leave my address and phone no. at the end of this article. Also, unfortunately, I will no longer have access to the net as of November 7th; so I will not be able to answer questions or take orders by e-mail. You will have to get in touch with me either by U.S. mail or by phone.

Please keep in mind that these prices are negotiable. Samten really would like to sell as much of this as he can since he no longer has an ST and he needs the money. So feel free to make an offer; if it is reasonable and no one has beat you to it, I will probably accept the offer. Here is the ad:

A friend of mine has sold his ST and wants to sell the ST software programs that he still has. He is willing to take best (reasonable) offer for these:

SOFTWARE Sale Price

Balance of Power (color system) $20
Flight Simulator (color) 20
High Roller (color) 20
Time Bandit (color) 15
Sundog (color) 15
Flash* (older version) 9
Degas* 9

108

All software has been rarely used and includes all manuals, original boxes and registration cards.

HARDWARE Sale Price

Macintosh 64K ROM chips for Magic Sac 27.50
10 disks of MAC PD programs for the
price of the disks (dsdd) ~17

BOOKS

Compute's 1st Book of Atari ST $7
Compute's St Artist 7
ABACUS Gem Programmer's Reference 8
Graphics & Sound 8
Tricks & Tips 8

____
38

A discount is available on purchase of all the books listed above.

MAGAZINES WITH DISKS

Start 5 vols $15
Compute ST 8 vols. 20
ST Log 3 vols. 10

___
45

I can be reached at:

Jim Cochrane
2295 Goss St. #1
Boulder, CO 80302
303-449-3315

I can often be reached in the daytime and evenings. You are more likely to find me in late at night; I will accept calls up until 'round midnight. Feel free to write or call me if you have any questions or would like to make an offer.
The name of my friend is Samten Nagarajan.

> anywhere else)...

> BobR

My Amiga came with all the pinouts and schematics in the owners manual.
And on my Mega I can't even hack together hobby projects since the cost
of the schematics is prohibitive. So much for public domain add-ons for
the ST. No wonder hardly anyone has done anything with the slot.

I guess I can always work on the PD 68020 board for the Amiga...

6008. This week's ZMAG/ST Report

Newsgroup: comp.sys.atari.st
Date: 1988-11-05 03:17:06 UTC
From: gdtltr@vax1.acs.udel.EDU
Message-ID: <2274@udccvax1.acs.udel.EDU>
Source record: 250158
Cross-posted to: comp.sys.atari.8bit,comp.sys.atari.st

I have decided to put off distribution of this week's mags until next week due to the virus that has been shutting down systems. A week should give most systems enough time to clear things up. I see no sense in sending out the files and having half of them bounce back here. I will send both this week and next week's files next week.
A few back issues are now available. If you made requests for back issues more than 2-3 days ago, please resend them as soon as possible.
New members for the list are always welcome. Just send me a message with the names of the mag(s) you want and a good path (preferably Internet) back to you. Please keep the request as short as possible to avoid clutter on my end. Thanx.

There are 23 spells documented on scrolls (there may be 24, but one is a duplicate). There are 2 more - the BRO (mana) potion and the VEN bomb-potion. Both begin with ZO and require flasks. (Invisibility is listed in an area near where the skeleton key for level 12 is found). I have heard rumors of other spells, but they may not work as of version 1.2 or some other object may be required, or an empty ready hand.

Send a check for $10 to Tony Andrews, 5902E Gunbarrel Ave., Boulder, CO 80301 and he'll mail you the whole package including sources with a printout of the documentation. Sozobon C also should be appearing on file servers and I believe it's already on the national pay $ervices.

(If you are outside the United States, you should check with your post office about international mail rates and add that amount with your request.)

Note: It does NOT include the AES library I've been working on (at least I don't think it does); I'm not affiliated with Sozobon. I plan to make the library available in the next couple of days. I've found a guy in Denver who says he's got a VDI library working with Sozobon. If it works out, we may distribute them together.

I would like to put them in POSTCRIPT or ASCII format, is there any existing soft
that performs this action ??
Thanks for all answers.

6015. CircuitMaker 2.01

Newsgroup: comp.sys.atari.st
Date: 1988-11-05 21:58:17 UTC
From: soohoo@cory.Berkeley.EDU
Message-ID: <7119@pasteur.Berkeley.EDU>
Source record: 250165

I just purchased CircuitMaker 2.01 by Iliad Software, Inc.
The premise is simply to be able to put together and simulate TTL
devices. I'd give you a review of the product, but it's simply
not cooperating, and I'd like some help:

I followed the directions for installing on a hard drive, and it
booted up just fine. Then, when I tried File...Load... XXXX Circuit
the circuit got loaded from disk, and displayed on the screen (for
a brief moment) and then TWO BOMBS!

So fine, I'm using the monochrome version, with a monochrome monitor,
on a 1040ST (minimum RAM satisfied), and all my silly accessories
stripped out, and still no luck (same symptoms).

Since I've also got a color monitor, I decided to try the color version
of the program (Iliad ships two disks, for separate resolutions).

It worked FINE in color.
So I can use it on color, but I'd RATHER monochrome!

I tried calling Iliad's BBS # in the back of the package, but I got
a # disconnected voice, no fowarding #. This worries me.

Does anyone have CircuitMaker 2.01 and NOT have this happen to them?

Thanks in advance, please e-mail.

> 68000 version). I'd really *want* a tos which could also run on my
> 68020!

Any information that you may have heard up now is just that rumors. Nothing
official has been announced by Atari Sunnyvale, where all the announcements
will come from.

Untill something is officially announced, be it through COMDEX this net or
ads on NBC, we cannot comment on anything that anyone says we are working on.
This policy has been in effect for about a year now partly to stop the
'vapor-ware' ideas that were floating around from 86-87.

I wrote >23 spells documented on scrolls

I found the BRO (mana) potion scroll where the Lyte Shield was - I have several sets of maps and lists and it was not on the set I looked up. The VEN bomb is not documented to my knowledge. That makes 24 other than the VEN bomb (which may still be documented in somewhere I haven't found...). In version 1.2 there are *exactly* 25 spells and no more. Lost Scrolls of Mt. Anaias has a correct and complete list.

6019. Sozobon C and dLibs v1.2 -- RELEASE

>

The following is the "announcement" that came on the distribution disk.
There are further comments at the end, and it's short, so please read
it all (especially archive moderators!).

Announcing

The Sozobon C Compiler

A new freeware C compiler has been developed by Sozobon, Limited and is
being distributed through bulletin board systems, networks of various
kinds, and by direct mail. The package was written by Johann Ruegg, Tony
Andrews, and Joe Treat and includes the following features:

* Full K&R compiler supporting: bit fields, structure assignment,
structure parameters and return values, enumerations, and floating
point.

* Full source code available at no additional cost.

* Compiler includes: front-end, optimizer, assembler, and linker.

* Code generation averages 5% to 15% better than Alcyon.

* Uses Dale Schumacher's dLibs runtime library (version 1.2) for
runtime support.

* Generates Alcyon-compatible object modules and libraries.

* A complete package, including utilities like: cc, ar, size, nm, and
an enhanced version of a PD make program.

* Includes a utility that removes local symbols from Alcyon libraries, reducing their size by around 30%.

The entire system is being distributed as freeware. If you receive this announcement, but are unable to find the compiler, you can order it from us directly by sending $10 (checks payable to Tony Andrews) to:

Tony Andrews
5902E Gunbarrel Ave.
Boulder, CO 80301

You'll receive one double-sided or two single-sided disks containing the compiler (source code and executables), documentation, and version 1.2 of dLibs (includes source). Be sure to specify single or double-sided disks and include your full return address. The $10 charge covers shipping and handling only. The product itself is free. You're encouraged to make copies for friends, upload it to bulletin boards, or put it in the disk library of your local user's group. Help us get the compiler distributed, so fewer people have to pay $10 for it, and we don't spend the rest of our lives copying floppies.

Tony Andrews
10/22/88
Sozobon, Limited

The package, which comes as three .ARC files (compiler binaries, compiler sources, and dLibs), has been posted to (at least) Compu$erve, GEnie and BIX. Tony has been having trouble getting news out from his site, so I'm posting this information. ARCHIVE MODERATORS: please send me uucp addresses that Tony and/or I could use to try to reach you. Include land-mail addresses also, since that may end up working better. So far, Tony hasn't heard back from any messages sent to various archive sites. The file sizes on the distibution disk are:

2027 ANNOUNCE
185522 DLIBS12.ARC
194571 SC_BIN.ARC
246884 SC_SRC.ARC
751 README
5 files (629755 bytes).

As an aside, the release of Sozobon C also means that dLibs v1.2 has been released and is available either from me, or through Sozobon. I'm holding off on sending dLibs to the archivers since it will arrive as part of Sozobon's package.

6021. Ymodem and VAX/VMS

Newsgroup: comp.sys.atari.st
Date: 1988-11-06 20:24:15 UTC
From: FXDDR@ALASKA.BITNET
Message-ID: <8811062022.AA06953@ucbvax.Berkeley.EDU>
Source record: 250171

I may be the last person in the world to have discovered this, but I kept wondering why UniTerm's ymodem would do strange things sometimes when downloading files from vax/vms. The file size on binaries was often much too small, and the files on the ST would sometimes be truncated; other times it would work fine. Turns out that in the vax source file VVMODEM.C, the routine "filestat" defines a variable "char ch;" when it should have "int ch;"...the original version only counts characters to the first 0x0ff in the file. UniTerm gets very confused when the stated file size is less than the true file size, and the UniTerm transfer buffer is larger than the true file size (got that?) but is okay when the transfer buffer is smaller than the true file size.
So if you've been having flakey ymodem transfers on vax/vms, take a look at your sb source...

6022. GEM for Sozobon C

Newsgroup: comp.sys.atari.st
Date: 1988-11-07 00:24:50 UTC
From: to_stdnet@stag.UUCP
Message-ID: <651@stag.UUCP>
Source record: 250172

From: thelake!steve@stag.UUCP (Steve Yelvington)

A set of GEM bindings written in assembler and compatible with Sozobon C showed up the other day at BRASS*BBS in Buffalo, N.Y. The package, GEMQ.ARC, includes AES, VDI and a utility library (handy functions for GEM programmers that aren't built into GEM).

The readme file in the archive includes a note from the author, Don E. Farmer, 16810 Deer Creek Drive, Spring, Texas 77379 to the effect that he wrote the libraries for Alcyon C users as a shareware project, but found no takers, so he was releasing them as "public domain" but retaining the copyright. (That's a contradiction, but I suppose he means "you can pass this around and use it as you see fit.")

The AES library is a little bit smaller than the one I wrote in C. I suspect that the VDI library is better than the one I haven't written yet. So I probably won't finish the job.

If someone will advise me where to send GEMQ for net distribution, I will do so.

I have a question about TOS on the 68020.

I have been told there are a number of "Line-A" or "Line-F" type traps that
actually use illegal rather unimplemented opcodes. These opcodes are used for
real instructions on the 68020.

If this is true, then there is little chance for 68020 TOS. Any comments?

Frankly, I don't know what to think about all this "proprietary information" stuff about the Mega bus. Here in Germany, a magazine has published the pinouts of the bus (I think it was c't), and another one even published the schematics for adding a Mega bus to any other model. Would I commit copyright infringment if I posted the pinouts on the net? I payed for the info anyway.. although not to Atari

On the 68020, line-F opcodes are used for co-processor operations. The line-A opcodes, however, are permanently available for use. You may note that the Macintosh uses line-A calls for all of its system calls so line-A is not a problem.

On the ST, TOS uses the line-F for internal calls. But that can be changed in any revision of TOS because those calls are "subject to change without notice." That, of course, means that Atari may, at their choosing, write a TOS/GEM implimentation for a 68020 system by moving the line-F calls and performing some basic rewrites to facilitate operation on a 68020.

6027. Atari Customer "Service"

Newsgroup: comp.sys.atari.st
Date: 1988-11-07 12:51:07 UTC
From: MLS@s40.prime.COM
Message-ID: <8811080315.AA03437@ucbvax.Berkeley.EDU>
Source record: 250177

Whoever posted that Atari Customer Service is helpful could not have called the same people I did!

Since I have not been successful in getting the information I need from the Net, I finally called Atari directly about my Chinon disk drive problem. (See various postings previous)

The girl put me on hold, talked to her technical people, then assured me that my service center was wrong. I called him back, made him call Atari himself, and then had to apologize because I was given bad information.

I called Atari back and got the same girl (Is there only ONE customer service rep?) She apologized, saying that there was a miscommunication between herself and the technician. She then told me that I would have to talk to Chinon because it was not an Atari drive. After I convinced her that she was still confused, she told me that I'd have to send in my entire 1040 for replacement, not just the mechanism. When I asked why I could not turn in my external drive casing (I have already swapped the mechs and have this one in the ST itself) she said that they only swap complete units. (I was talking slowly and clearly - she sounded like she had no idea what a disk drive even was!!! She called it a hard drive three times.)

She finally gave up and gave me to her technical people when I asked her if I would get a Chinon back, or maybe a Sony - the drive Atari now uses.

I figured once and for all, I'd ask the technical people about a speed port on the Chinon. The clown I spoke to didn't know either. He said that only manufacturing people knew and that he was there only to answer technical questions for end users!!!! I thought mine was a technical question!!!

The final resolution is this. If I don't hear from a semi intelligent Atari customer service person soon, I plan to throw my ST in the trash, sue the original center that gave me the bad drive in the first place, and buy an Amiga (That ought to get the flames going.)

I am sick and tired of dealing with incompetence when it comes to my computer. It's no wonder Atari has such a bad reputation!!!!!

6028. Chinon Double sided Mechanism (running fast) for sale cheap

Newsgroup: comp.sys.atari.st
Date: 1988-11-07 13:22:29 UTC
From: MLS@s40.prime.COM
Message-ID: <8811080346.AA03968@ucbvax.Berkeley.EDU>
Source record: 250178

Well, I've finally given up on getting help from Atari. I guess the bottom line from them was that if I sent in my drive and $90, I'd get a replacement.

However, I was at a computer fair this weekend, and found many compatible mechanisms selling for $55 to $75. I wasn't sure about the cheap ones, so I spent the $75. So for $15 less, I kept my old mechanism, saved the postage, and saved six weeks time.

Isn't Atari great??? Anybody using their exchange policy has to be crazy. It's another Atari ripoff.

By the way, my Chinon mechanism is now for sale. Best offer accepted. It is newly aligned and works fine on standard disks. It is running fast (about 309-310 rpm) so it is not compatible with 10 sector format.

If interested, please send me an offer.

Matt Stone

6029. re:tt tt/x rumours

Newsgroup: comp.sys.atari.st

Source record: 250179

I dont wish to defend Atari but I think a lot of vague ghostly
rumours are being drawn to create a lot of thin air. Just because
this machine has been rumoured and because Atari has a big stand
at Comdex does no automatically produce a Link (would that I was wrong!)

I think Atari have every write to come down on people who relase data
clearly marked for internal circulation ... ideas floating round
a lab dont become products all the time. It is clear that Atari
must continue to go up market with a 68030 product to cover the
market between the Megas and the Abaq (I prefer the old name) and
that the old Tos 1.3 wont be good enough to match the things the
030 is capable off. This development will take time and what
is there that forces to release a hasty product now. Surely theu
should wait for the state of the market to clarify itself
I would expect a product in 6 months time and I hope that
all the rumour mongering doesnt taint the public into
expecting and demanding things that dont exist.

Freedom in information is all and good in a perfect world but
I think a bit of respect for other peoples rights to retain
privacy of information is also called for

> you mention.

GemDos is still limited to 16 Meg partitions. Several of
the hard disk systems do allow you to create partitions larger than
16 Meg as long as the partition is *NOT* used for GemDos (ie. Spectre,
Minix, OS9, etc.). Atari has not said anything about increasing the
16 Meg limit in the newer TOS releases.

GemDos is also limited to 16 drives, A to P. (NOTE: The
original doc said there was a 32 drive limit.) Drives A and B
are used for floppies, leaving 14 drives for hard disk partitions.
Atari's hard disk software only supports 4 partitions per physical
drive giving a 48 Meg limit. Supra, ICD and BMS all allow up to 14
partitions per drive, giving a 224 Meg limit.

Unless I'm mistaken, your holding a copyright to a program simply means you
are the only person who has the right to make money from it. The purpose
for many public domain copyright notices is to keep certain people from selling
your product while claiming that they developed it. This is in contrast to
having the sole right to copy it, despite how it sounds.

6033. A proposal--TOS Replacement Project

Newsgroup: comp.sys.atari.st
Date: 1988-11-07 17:33:40 UTC
From: pa1132@sdcc15.ucsd.edu
Message-ID: <700@sdcc15.ucsd.edu>
Source record: 250183

Well, everybody is tired of waiting for Atari to improve the ST, right? Atari is hopeless. Then, why not improve it by ourselves? In the Amiga world, they have something called "ARP", short for "Amiga-DOS Repleacement Project", which some Amiga developers wrote to replace the dump Amiga DOS. Their idea worked. So, perhaps it is time for us Atari people to have a TOS Replacement Project--to write a new, but compatible operating system to replace the old brain-damaged TOS. The new operating system should be called "STOS", short for "SmarTer Operating System", meaning an OS smarter then TOS. Any comments?

6034. Status of ST Upgrades?

Newsgroup: comp.sys.atari.st
Date: 1988-11-07 17:50:28 UTC
From: stuart@rennet.cs.wisc.edu
Message-ID: <6612@spool.cs.wisc.edu>
Source record: 250184

I have not been reading this group for a few months, but when I caught
up recently I noticed several new "faces" from Atari, so I'd like to
ask a few perennial questions. Perennial in that I have been asking
them every six months or so for the last two years or so.

1) What is the status of the second party documentation? In June 1987
the word was "hopefully in the bookstores by Christmas 1987". Since
then (roughly mid-1988) I have been reassured that professional
quality documentation is still in progress. So:
a) Is second party documentation planned or cancelled?
b) Is second party documentation in progress?
c) When is expected availability of second party documentation?
d) Who is the publisher or distributer?

2) What is the status of blitters for 1040STf's? I stopped asking
my dealer about this a year ago, when it was clear I knew more
about it that they did, and that I didn't know enough to be
useful. So:
a) Are blitter upgrades for blitter-less 1040's planned or cancelled?
b) Are blitter upgrades for blitter-less 1040's in progress?
c) When is expected availability of blitter upgrades for blitter-less 1040's?
d) What is the procedure for obtaining an upgrade?

3) What is the status of TOS fixes and upgrades for existing ST's
(not new ST's or Megas)? I understand that this has actually been in
progress for some time, so I'll ask:
a) What TOS upgrades are currently available for existing ST's?
b) What TOS upgrades are planned for existing ST's?
c) When are these upgrades expected?
d) What is the procedure for obtaining an upgrade?

Hmm, this leads to two questions.

One, has TOS 1.4 fixed this problem ? If it has then the Atari folks might get in on the 68020 bandwagon that that Amiga folks have been riding for some time. There is even a PD PC board that converts the 68000 socket to a 68020 + 68881 socket. Bringing the number of '020 conversion products up to 5 (Ronin, CSA, Hurricane, Commodore, PD).

Two, if not could it be made part of 1.5 or is the rewrite such that it would have to wait until 2.0. Has the '030 project carried TOS with it or is it a UNIX-only box?

6037. GTS100 disk drives

Newsgroup: comp.sys.atari.st
Date: 1988-11-07 20:56:40 UTC
From: Mr._Peter_Lawrence_Jackson@mtsg.ubc.ca
Message-ID: <1297070@mtsg.ubc.ca>
Source record: 250187

On Nov 1 1988, Jim McCabe asks...
>Does anyone have any experience with the Indus GTS100 disk drives?
>Are they more or less reliable than their Atari SF314 counterparts?
>.....

I have owned a GTS100 for about 3 months now - its manufactured by another company now (I think its called something like Future Systems), but I am pretty sure its the same drive as the INDUS. I have been quite happy with it. It is quieter, smaller, and it seems faster than the Atari drive. It also has a couple of extra features: As well as a busy LED, it has a power LED and a two digit LED track indicator.

On the negative side, it *seems* that the drive has to be powered on before the computer is booted and a boot disk is inserted. Previously I would power up my system all at once by switching on the power bar. However I discovered that when I did this with the GTS100 drive, the disk track containing the directory would get screwed up - making several files on the disk unaccessible. I have not yet discovered whether this is a problem with my GTS100 drive, or is endemic to the whole batch. The problem was eliminated when I turned the GTS100 on before turning on the ST.

The "writer", in my posting, is not you, Frans, but the person who published
the original magazine article. I cannot (and do not) complain at your
reiterating words you have read in a freely available (or maybe DM x.xx?)
publication.
And my comment had nothing to do with 'freedom of speech'. It is more
related to such apparently dying concepts as trust and cooperation - again,
not directed at you, Frans. I believe the publisher should really have
contacted myself or someone at Atari Sunnyvale, especially since, it seems,
my name appears as part of the article.

> I will: Helios is just a UNIX look-alike, it isn't equivalent to
> it (in my view). Why? Well, essentially, it's been designed to run on a
> network of transputers and not the 68030!

That's just scratching the surface. Perhaps the most important difference between Helios and UNIX is that all implementations of UNIX, by definition, use MMUs for protection, so that errant code in one application can't clobber other applications or the kernel. Helios can't offer any inherent protection, since Transputers don't. Of course, it may be difficult for a process on Transputer A to clobber a process on Transputer B, but adding one Transputer per process is about the only way you can get real protection, which is pretty ugly.

> Thus, Helios for the Atari could perhaps be compared to Mach (-> NeXT,
> comp.sys.next) which *is* a *tightly coupled* multiprocessor system.

The current Mach kernel on the NeXT machine is supposedly the more mature Mach kernel, the one without multiprocessor support. However, Mach was designed for tightly coupled multiprocessing, and certainly one would expect NeXT to eventually offer that version of the kernel, perhaps when it's fully working and NeXT has additional CPU modules to add into their box.

> In Canada, Atari charges $125 for documentation, and $150 for docs with
> support. I suppose that this means that they feel support is only worth
> $25... (from the way developers talk about the quality of the documentation
> on the net, you'd figure that it should be $25 for docs and $125 for support).
>
> ron

Sorry Ron, that is incorrect...

We charge $125 for the documentation and $150 for a developer
support/registration package (which includes MadMac, RCS, ALN, DB, etc).

For documentation and the support/registration package it is $125+$150,
$275 in other words.

The documentation/support/registration (i.e. development kit) with the
Alcyon C Compiler is $350, with MWC 3.0 it is $450.

As a matter of policy in supporting third party developers, I have (and am)
more than glad to send out bits and pieces (i.e. Mega bus pinout docs) for
no charge. All that people have to do is ask!

There have been comments on this net from atari net addresses which
address weither the TT system would have SYS V vers berkely 4.X
features among other comments. If there is no such system planned
for introduction then atari itself is guilty of the thin air you speak of.

>
> I think Atari have every write to come down on people who relase data
> clearly marked for internal circulation ... ideas floating round

I believe you are refering to an individual who reported what he
saw in a german magazine. He was well with in his rights to post
what information he was in possession of. In fact if they were
just rumors then he was within his rights to pass them on. This
is called free speech sinces intensions were not the libel atari.

Atari can, if its desire, deny that any development is taking
place and that no such product is being readied for introduction.
That have had ample opportunity to do so but have not. They
have their reasons and we can only hope that honesty is playing
a part in not wanting to deny such.

Honesty from atari? What a concept.
[Replace atari with your favorite company. :) :) :)]

> a lab dont become products all the time. It is clear that Atari
> must continue to go up market with a 68030 product to cover the
> market between the Megas and the Abaq (I prefer the old name) and

They don't have to cover any market. The goal here is profit. Companys
who have tried to be all things to all people have failed!!!!

> that the old Tos 1.3 wont be good enough to match the things the
> 030 is capable off. This development will take time and what

What TOS 1.3. According the atari sources on this net there have been
two releases of TOS. That is 1.0 and 1.2. A much rumered 1.4 is
to be released in the future.....not yet..

> is there that forces to release a hasty product now. Surely theu
> should wait for the state of the market to clarify itself

By the time the market has clarified itself, the front runners in
that market place are already established, usually.

> I would expect a product in 6 months time and I hope that
> all the rumour mongering doesnt taint the public into
> expecting and demanding things that dont exist.
>
> Freedom in information is all and good in a perfect world but
> I think a bit of respect for other peoples rights to retain
> privacy of information is also called for

Note the comment above concerning atari's information spreading.
Otherwise I agree completely. Information that was released by
non atari sources in violation of confidentiality agreements should
have its sources sought out and taken to court under the agreement
in force.

My faith in atari's ability to deliver new products has sunk to new lows.
That is no faith. I won't believe it until I see it at their fed. stores.

C'est la vie.

6050. question for Okimate 20 users

Newsgroup: comp.sys.atari.st
Date: 1988-11-08 16:02:08 UTC
From: georgew@tekig4.TEK.COM
Message-ID: <3404@tekig4.TEK.COM>
Source record: 250200

My Okimate 20 documentation claims that it will emulate an Atari SMM804,
which in turn emulates an Epson printer (I think).

However, the only time I actually tried this (booting without the Okimate
color printer driver and pressing Alt-Help to dump the screen in Epson format),
several dots in my print head burned out, and I had to get a new print head.

So my question is, was this just a coincidence? Do other Okimate 20 users
use their printers on a daily basis in SMM804 graphics mode? There are a
lot of S/W packages out there that support the Epson or Atari printers but
do not specifically support the Okimate 20.

Thanks in advance.

Customer Relations only does replacements on complete units. We do not
swap mechanisms. This is company policy. Also, there are several Customer
Service Representatives. If you call Atari again, please ask for the
person's name (in both the Customer Relations and Tech Support Depts) and
let us know who this person is. We would like to correct the information
they are providing. This way we can improve the support we are providing.

> She finally gave up and gave me to her technical people when I asked her

Our Manufacturing Facility uses a number of different mechanisms at any
given time. Therefore, we cannot quote you the type of mechanism that would
be in the drive returned to you. This varies depending on the drives we
have in stock.

> question!!!
>

To my knowledge there isn't an easy way to adjust the speed on the Chinon mechanisms. As you may have noticed, the mechanisms are closed units. I will check with our service dept and see if they have more information than I do.

> In the Amiga world, they have something called "ARP", short for
> "Amiga-DOS Repleacement Project", which some Amiga developers wrote
> to replace the dump Amiga DOS. Their idea worked.

But make sure you're talking about the same thing. ARP on the Amiga does bascially two different things. First of all, it provides functional look-alikes for many of the AmigaDOS shell commands. The commands supplied by Amiga have a few faults -- not all handle wildcards where appropriate, they're not perfectly symmetric in their argument handling, and may of them are written in the BCPL language, which makes them large. ARP commands are written in assembly, which makes them much smaller. So floppy based users can fit more DOS commands on a disk, and everyone who uses them gets commands that operate much faster.

The second thing ARP does for you, which is also another reason the ARP commands are smaller, is provide a toolbox of functions in a shared library called "arp.library". As in all Amiga shared libraries, the code for the library exists only once, no matter how many programs are currently using it, and it generally only must be loaded into memory the first time an ARP commands is used (it'll get thrown out if no one's using it and the space it takes up is needed). Anyway, the ARP library contains functions useful in writing programs that aren't provided by the supplies Amiga OS. Things like a wild card pattern matcher, a standard file requester, some resource tracking stuff, etc.

So in one sense, ARP replaces part of Amiga DOS in that it replaces the DOS commands a user normally uses to interact with the machine. And the user have the source to these commands available. In another sense, that of the ARP library, ARP is really an addition to the Amiga's operating system.

> So, perhaps it is time for us Atari people to have a TOS Replacement Project--
> to write a new, but compatible operating system to replace the old
> brain-damaged TOS. The new operating system should be called
> "STOS", short for "SmarTer Operating System", meaning an OS smarter
> then TOS. Any comments?

I don't know much about TOS, but if you're really planning to actually replace the ST's operating system, as in the operating kernel, not just a bunch of DOS commands on disk, you're getting into something that sounds very much more complicated that what ARP is. If that's necessary, good luck -- it probably can be done if you can muster enough support from the ST community. If it works in

other respects like ARP -- you give it away and it gives you extra functionality
and takes nothing away from what you already have, perhaps it'll work.

><The opnions expressed are not usually that of Atari Corp. and were rented by
>me for use in this message>

Dan,
I talked to Iliad Software yesterday (11/7), by calling the (801)226-3270
number, and essentially listed bugs at them.
They were quite polite about the whole thing, and said that they were
having problems with their duplication proceedures, and switched about
a month and a half ago. My copy also had a serial # of the 1st copy
from a batch about 9 weeks ago, so it was suspect.
I told them the registration card was in the mail, and they told me
a new copy was in the mail. Remarkable nice of them.

The bottom line is this:
If you have problems with this piece of software, write Iliad with the
bugs you've encountered, include your serial #, and suggest improvements.
They should a) write back and tell you to send money, or b) send you a
new copy, depending on the severity / blame of the problems. (I would
like to think they would supply a replacement for bad duplicates).

Thanks for the concern Dan, glad to hear you listening!

I think you're mistaken. Copyright means having the sole right
to copy something. The principle behind this is that the copyright holder
should be paid for each copy in use. If copyright only meant you can't sell
something for a profit, there would be nothing illegal in passing out free
copies of Word Perfect to your friends or in posting it to free bulletin boards.

Then The Association for Computing Machinery (:-)) writes:
> Unless I'm mistaken, your holding a copyright to a program simply means
> you are the only person who has the right to make money from it.
> Plinio Barbeito

[This comes up a lot in computer circles so note this please.]

Plinio is mistaken. Copyright means just that, the right to control the
copies. Generally authors allow copies to be made if you send them
some money for each one. They may also make other provisions such as
"You may copy this work if you do not profit by making that copy."
Or the all encompassing "No copy of this work may be made without express
written permission of the author." (sometimes folks just say "All rights
reserved.").

And now for the scary part. If you, the author, put the words "public
domain" on the work they _supercede_ the copyright notice and the
work becomes public domain. And anyone can do anything with public
domain programs with out so much as a nod in the author's direction.
The worst problem is when someone collects some public domain programs
and sells them as "their" tools package for $59.95 or what ever. The
author has no recourse in this case, period. So the bottom line is
never, never, never, never, call something you wrote public domain
unless you really mean public domain. You can call it freely redistributable
which is what you probably meant anyway. And of course be sure to
put a legal copyright on all works, follow up with a registration
if you are going to market it. A legal copyright notice consists of
the word "Copyright", the year, and the name of the copyright holder.
Following the copyright should be a statement of rights indicating
your wishes, if you don't have a statement then add on that says "All
rights reserved." If you don't do this then you will be taken advantage
of by unscrupulous people in the computer business and you will not
be able to sue them.

From: keithj@ux1.lbl.gov
Message-ID: <1238@helios.ee.lbl.gov>
Source record: 250060

Did you guys get an upgrade notice from Illiad for your Circuitmaker 2.01? I sent in my card from the very beginning with version 1 and the only way I found out about version 2.01 was through usenet and the latest edition of the ST Informer. What's the point of sending in a registration card if you aren't going to be kept up to date on upgrades. By the way, does anyone know the price for an upgrade to version 2?

Keith

6061. How is Atari doing in Germany?

Newsgroup: comp.sys.atari.st
Date: 1988-11-08 22:50:43 UTC
From: pa1132@sdcc15.ucsd.edu
Message-ID: <706@sdcc15.ucsd.edu>
Source record: 250061

Can anyone from Germany tells us what happening there? Is the share of market belonging to Atari being eaten away by the Amiga? Atari is always "proud" of their success in Europe, but many sources seem to indicate that the last stronghold of Atari is also lost to Amiga. Someone in comp.sys.amiga said that "Commodore" is the best selling computer in Germany. which Commodore? C64/128 or Amiga 500? I guess it's the Amiga 500. Now see what else Atari will say. Perhaps the only thing Atari is preparing to do is to go bankruptcy.

Also, can anyone from Atari tell us why Atari never releases their sale figures? Is Atari ashamed of their number? Or what?

In article <700@sdcc15.ucsd.edu> pa1132@sdcc15.UUCP () writes:
[Suggests users write a new version of TOS.]

I have another suggestion that may work better in this case.
One of the reasons that ARP on the Amiga has been successful
is that a lot of the DOS internals are documented and the
technical folks are usually quick to give in depth technical
answers to developer questions. (both on Usenet and on BIX where
they reside "officially") Unfortunately a similar situation does
not exist for the ST developer community.

There is hope though, in that now MINIX is available for the ST
and it should be possible to build a window system on top of MINIX
that would be a good substitute for TOS. If TOS compatible library
calls could be implemented then you have a shot at replacing it
with something that a) doesn't require Atari support, and b) has
all or most of the source code available for it. (It is also
multitasking which is a *big* win when you are programming
window systems)

So maybe this might be an alternate tack that could yield some
quite successful results for everyone.

If you have an Okimate 20 with an Atari ST interface card, I'm pretty
sure that the Okimate emulates a SMM804 graphics mode.
No guarentees for Epson mode (if you use Alt-Help in COLOR mode it will
dump to the Okimate 20 correctly, I've done it).

>brain-damaged TOS. The new operating system should be called
>"STOS", short for "SmarTer Operating System", meaning an OS smarter
>then TOS. Any comments?

I have a comment. Why not adopt MINIX as that new OS?

Some people could possibly write a "gem" program for it that would allow regular ST software to run compatibly. If this could be done then I think MINIX should be first on the list since:

* MINIX can be succesfully used with other processors. I remember a case a while ago in which someone using MINIX replaced the 68K with a 68020. There wasn't much of a speed increase, but then I don't think he went "all the way" with the hardware (i.e. a faster clock for the CPU and for the separate board of memory and/or an SRAM cache). I guess if you had to run true-blue GEM programs you could just toggle a switch.

* MINIX multitasks. I have thought about it for a while, and have come to the conclusion that in order to implement powerful networking for the ST, a multitasking OS would make things much, much easier. Of course there are other benefits to multitasking, but that is an exercise left to the reader.

* MINIX already includes the source! That means that if there is a bug, YOU have the chance to fix it without waiting on anyone. Having the source to the OS also opens up other worlds of possibilities, like implementation of sockets (am I dreaming?), an added dimension to debugging (e.g. if you want to find out what the OS does during disk writes, you just look and read the comments!), a boost towards being able to make it TOS compatible, and many other advantages.

* MINIX is robust. This is a second source opinion as I don't have MINIX yet. However, most of the bug reports I've seen in comp.os.minix have been pretty piddly-type things. Shake well and give time for setting of contents.

* etc...

For your convenience, I include here what someone in comp.os.minix had to say:

> I have been using/playing with Minix for the ST for a couple of weeks
> now, I think that it beats gemdos by a mile, even though it, at this point,
> does not support all of the st's hardware. I have a few questions I hope

[rest deleted]

So far I have not come across someone that has HATED it. Will anyone who has MINIX already care to comment or provide the disadvantages?

Plinio Barbeito
P.S.
It really would have been best for me to post something like this AFTER I had my copy of MINIX, but as long as you were asking for people's 2 cents...

The newest version of SIGNUM, SIGNUM II (about one and a half year old) can export SIGNUM files as ASCII.
For SIGNUM I there exists a PD-Program that does the same. I don't have it (because I use SIGNUM II) but it should be available from several PD-Soft Services.

Hope this Helps

Here is an article quoted from the german newspaper "DIE WELT"
from 09.11.1988, translated to my version of 'german' English:

"The rising of the video game and homecomputer manufacturer
Atari into the area of scientific workstations is late.
According to Atari's head Jack Tramiel the company is
working on a workstation on the basis of the Inmos
Transputer T-800, a chip for - especially fast - parallel
processing. For the planned operating system Helios which is
developed by the british firm Perihelion Software Ltd. was
not ready in time, the release of the Atari computer is
delayed until 1989. Bad luck Atari also had in finding a
name for the high-performance-computer: The name 'Abaq' is
already reserved by a belgian company."

I've heard a term called "FREEWARE" that refers to zero cost - copyrighted
programs. I infers the no-cost status of the software, without the author
lossing the ownership of it that "public domain" implies.

This (half documented) facility was 'designed' as a replacement for
the VT200/VT300 downloadable fonts, there is no automatic screen
redraw and you have to understand the mechanics of VTXXX font
selection to be able to actually use them (If you just want to change
the ASCII character set UniTerm uses, you can use one of the various
programs that are available that change the fonts used by the
desktop). (I might consider making the normal fonts loadable, but it
will make the program another couple of Kb's larger......)

Atari is doing very well in Europe. Almost 4 STs are sold for each Amiga. Atari releases their sales figures every quarter; they are required to release them by the SEC, since they have an obligation to the people who own shares in the company. By the way, almost one-third of Amigas made in Europe are returned as defective.

On another totally unrelated note:

Is it possible to write a program that will backup the FAT and the directory of a hard disk partition? Programs that wipe out hard disks generally do so by destroying the FAT and the directory.

A program that will backup the vital information on a disk is effective protection against viruses and other malicious code. Is this project feasible? Such a program will probably make backing up a hard disk much more painless!

Lawrence Y. Chiu; University of California, Berkeley.

> Also, can anyone from Atari tell us why Atari never releases their
> sale figures? Is Atari ashamed of their number? Or what?

Atari is a publicly traded corporation, on the American Stock Exchange (symbol ATC). It regularly releases quarterly reports (3rd qtr report due imminently) on time scales which are (a) legal and (b) consistent with most other companies (ie around 6 weeks after close of quarter). These reports include sales figures (and have even separated Atari's Federated subsidiary, to clarify the situation).
I have come across few companies in this business which break out revenue by country - almost all consolidate their figures, although I guess each subsidiary is obligated to file its local figures for local tax reasons, so that would be an appropriate source.
Finally, as a shareholder, you get the Annual Report and can request a 10K, which is the document filed with the Securities and Exchange Commission (SEC).
Hope that's enough info! Most of it applies to ANY public company.

Roy J. Good
Product Development, Atari Corporation
Views expressed are my own. Atari may agree or disagree; they have the right.

Introductory information
----
word = 2 bytes
long = 4 bytes
palette = Hardware color palette, stored as 16 words. First word is
color register zero (background), last word is color register
15. Each word has the form:

Bit: (MSB) 15 14 13 12 11 10 09 08 07 06 05 04 03 02 01 00 (LSB)
-- -- -- -- -- -- -- -- -- -- -- -- -- -- -- --
0 0 0 0 0 R2 R1 R0 0 G2 G1 G0 0 B2 B1 B0

R2 = MSB of red intensity
R0 = LSB of red intensity

G2 = MSB of green intensity
G0 = LSB of green intensity

B2 = MSB of blue intensity
B0 = LSB of blue intensity

Intensity ranges from 0 (color not present) to 7 (highest
intensity).

Example: { red = 7, green = 3, blue = 5 } -> 0735 (hex)

Caveat: It is wise to mask off the upper four bits of each
palette entry, since a few programs store special
information there (most notably Art Studio).

The Formats

<NEOChrome>

1 long resolution (0 = low res, 1 = medium res, 2 = high res)
16 words palette
12 bytes filename (" . ")
1 byte Left color animation limit (starting color number)
1 byte Right color animation limit (ending color number)
1 byte color rotation speed
1 byte color rotation direction
1 word color rotation duration (number of iterations)
18 longs reserved for expansion
16000 words picture data (screen memory)

32128 bytes total

<NEOChrome Animation>

NOTE: To get this feature on versions 0.9 and later select the Grabber
icon and click the both mouse buttons in the eye of the second R in
the word GRABBER.
Interestingly enough, some versions of NEO only require you
to press the right button, not both. Hmmm...

16000 words picture data (screen memory)
4 words left color animtion limit table (starting color numbers)
4 words right color animation limit table (ending color numbers)
4 words animation channel direction flag (0 = left, 1 = off, 2 = right)
4 words animation channel delay in 1/60's of a second. [0 - 128]
-----------
32066 bytes total
```

<DEGAS Elite (Compressed)>

```
1 word resolution (same as Degas, but high order bit is set;
i.e., hex 8000 = low res, hex 8001 = medium res,
hex 8002 = high res). Other bits may be used in the
future; use a simple bit test rather than checking
for specific word values.
16 words palette
< 32000 bytes control bytes
4 words left color animtion limit table (starting color numbers)
4 words right color animation limit table (ending color numbers)
4 words animation channel direction flag (0 = left, 1 = off, 2 = right)
4 words animation channel delay in 1/60's of a second. [0 - 128]
-----------
< 32066 bytes total
```

Control byte meanings:

For a given control byte, x:

```
0 <= x <= 127 Use the next x + 1 bytes literally (no repetition)
-127 <= x <= -1 Use the next byte -x + 1 times
-128 No operation (ignore)
```

Compression Scheme:

Each scan line is compressed separately; i.e., all data for a given scan line appears before any data for the next scan line. The scan lines are specified from top to bottom (i.e., 0 is first). For each scan line, all the data for a given bit plane appears before any data for the next higher order bit plane.
To clarify: The first data in the file will be the data for the lowest order bit plane of scan line zero, followed by the data for the next higher order bit plane of scan line zero, etc., until all bit planes have been specified for scan line zero. The next data in the file will be the data for the lowest order bit plane of scan line one, followed by the data for the next higher order bit plane of scan line one, etc., until all bit planes have been specified for all scan lines.

<C.O.L.R. Object Editor Mural>

16000 words picture data (screen memory)
(palettes are stored in separate files)

32000 bytes total

<Tiny>

1 byte resolution (same as NEO, but +3 indicates rotation
information also follows)

If resolution > 2 {
1 byte left and right color animation limits. High 4 bits
hold left (start) limit; low 4 bits hold right (end)
limit
1 byte direction and speed of color animation (negative value
indicates left, positive indicates right, absolute value
is delay in 1/60's of a second.
1 word color rotation duration (number of iterations)
}

16 words palette
1 word number of control bytes
1 word number of data words
3-10667 bytes control bytes
1-16000 words data words

42-32044 bytes total

Control byte meanings:

For a given control byte, x:

x < 0 Absolute value specifies the number of unique words to
take from the data section (from 1 to 127)
x = 0 1 word is taken from the control section which specifies
the number of times to repeat the next data word (from
128 to 32767)
x = 1 1 word is taken from the control section which specifies
the number of unique words to be taken from the data
section (from 128 - 32767)
x > 1 Specifies the number of times to repeat the next word
taken from the data section (from 2 to 127)

Format of expanded data:

The expanded data is not screen memory bitmap data; the bitplanes are
separated and presented in columns. All the data for a given bitplane
appears before the data for the next bitplane. The data for each
bitplane appears as a sequence of columns, where a column consists of
one specific word taken from each line. For example, column 1 consists
of word 1 on scanline 1 followed by word 1 on scanline 2, etc.,
followed by word 1 on scanline 200.
To illustrate: The first data in the file will be the data for
bitplane 1, which consists of columns 1, 5, 9, etc., in order. The

next data will be the data for bitplane 2, which consists of columns 2,
6, 10, etc., in order.

<Spectrum 512 (Uncompressed)>

80 words first scan line of picture (unused) -- should be zeroes
15920 words picture data (screen memory) for scan lines 1 through 199
9552 words 3 palettes for each scan line (the top scan line is
not included because Spectrum 512 can't display it)

51104 bytes total

<Spectrum 512 (Compressed)>

1 word 5350 (hex) ("SP")
1 word 0 (reserved for future use)
1 long length of data bit map
1 long length of color bit map
<= 32092 bytes compressed data bit map
<= 17910 bytes compressed color bit map

< 50014 bytes total

Data compression:

Compression is via a modified run length encoding (RLE) scheme. The
data map is stored as a sequence of records. Each record consists of a
header byte followed by one or more data bytes. The meaning of the header
byte is as follows:

For a given header byte, x:

0 <= x < 127 Use the next x + 1 bytes literally (no repetition)
-128 <= x < 0 Use the next byte -x + 2 times

The data appears in the following order:

1. Picture data, bit plane 0, scan lines 1 - 199
2. Picture data, bit plane 1, scan lines 1 - 199
3. Picture data, bit plane 2, scan lines 1 - 199
4. Picture data, bit plane 3, scan lines 1 - 199

Decompression of data ends when 31840 data bytes have been used.

Color map compression:

Each 16-word palette is compressed separately. There are three
palettes for each scan line (597 total). The color map is stored as a
sequence of records. Each record starts with a 1-word bit vector which
specifies which of the 16 palette entries are included in the data
following the bit vector (1 = included, 0 = not included; i.e., stays
the same). The least significant bit of the bit vector refers to
palette entry zero, while the most significant bit refers to palette
entry 15. Bit 15 must be zero, since Spectrum 512 does not use palette

entry 15. Bit 0 should also be zero, since Spectrum 512 always makes the
background color black.
The words specifying the values for the palette entries indicated in
the bit vector follow the bit vector itself, in order (0 - 15).

<Animatic Film>

1 word number of frames
16 words palette
1 word speed (0 - 99; higher value is faster)
1 word direction (0 = forwards, 1 = backwards)
1 word end action (what to do after the last frame)
0 = pause, then repeat from beginning
1 = immediately repeat from beginning
2 = reverse
1 word width of film in pixels
1 word height of film in pixels
1 word version number (major)
1 word version number (minor)
1 long magic number 27182818 (hex)
3 longs reserved (should be all zeros)
----
32 words total for header

? words image data (words of screen memory) for each frame, in order

<MacPaint>

header {
1 long version number (if zero, entire header is ignored)
38 * 2 longs pattern data (anyone know how to use this?)
51 longs reserved
}
< 51200 bytes compressed bitmap data

< 51716 bytes total

Bitmap compression:

The bitmap data is for a 576 pixel by 720 pixel monochrome image.
The data is stored as a sequence of records. Each record consists of a
control byte followed by one or more data bytes. The meaning of the
control byte is as follows:

For a given control byte, x:

0 < x < 127 Use the next x + 1 bytes literally (no repetition)
-128 <= x <= 0 Use the next byte -x + 1 times

There are 72 bytes per scan line. Each bit represents one pixel; 0 = white,
1 = black.

6081. New Migraph Product

Newsgroup: comp.sys.atari.st
Date: 1988-11-09 18:44:13 UTC
From: keithr@vice.ICO.TEK.COM
Message-ID: <3010@vice.ICO.TEK.COM>
Source record: 250081

I was at a local Atari Club meeting this week and saw a new product being shown by Migraph, the Easy-Draw people. It is called Touch-Up and is scheduled to be released December 8th.

Touch-Up is a image editor. The package was very professional looking, as one might expect from Migraph, and was loaded with features. It allows you to edit image files, TFF, PCX, and others. You can create images by defining a "clip" area and read an image into that area, slant it, mirror it, shadow it, flip it, rotate it, outline it, read in some more images, etc. It allows you almost unlimited creativity. It gives you tools for creating your own images from scratch if you want. Define fills, make circles, curves, boxs, define line width, and gives you text capabilities.

I was very excited to see this product from Migraph. It is another big plus for using the ST for desktop publishing. The guy from Migraph, sorry I forgot his name, said it works on the 19" monitor and that Touch-Up will be released for both the ST and IBM PC at the same time.

He also said they will be releasing about four other products next month one of which is finally a postscript driver for GDOS. He is the one working on it and he seemed confident that it would be ready in time.

==========
Disclaimer: I don't work for Migraph, I am just a very satisfied customer of their products

> registration card if you aren't going to be kept up to date on upgrades.
> By the way, does anyone know the price for an upgrade to version 2?
>
> Keith

I did exactly the same thing. I have had no notification of an upgrade,
and see no reference to there even being an upgrade from v1.0.

Did they improve the button response in v2.0?? I hope so it is almost
useless in v1.0.

If Iliad are out there how about supporting the people who supported you
with the first version??

6083. Digest mailing problems

Newsgroup: comp.sys.atari.st
Date: 1988-11-09 18:55:45 UTC
From: ravi@MCNC.ORG
Message-ID: <8811091855.AA04767@alvin.mcnc.org>
Source record: 250083

A lot of digests have bounced this past week, possibly due to
the recent downtime of the various networks. I'm enclosing a _partial_
list of addresses from which _multiple_ digests have bounced (most
others only missed one or two digests). I'm afraid that the sheer
volume of bounced mail makes it impractical to remail each digest to
its intended recepient.

I'm aware that there are some problems with irregular distribution
of digests, which result in missing digests at the various redistribution
sites. I am trying to put together a scheme by which I will be able to
maintain _one_ _complete_ set of digests, which other archival sites can
use for redistribution. The host I would like to use it presently
unusable due to disk-space restrictions, but I am attempting to get
that straightened out soon, and I will get in touch with everyone as
soon as it is all set up.

Keep tuned for more on that, and again, sorry I can't do more
about the disruption,

From: brett@sylvester
Message-ID: <3029@haven.umd.edu>
Source record: 250086

Is there any source code in the public domain to do MIDI networking
for the ST? I want to set up a very simple MIDI ring, where only a few bytes
will be passed at a time, with a maximum of 16 machines in the ring.

Thanks for any information you can pass on.

Newsgroup: comp.sys.atari.st
Date: 1988-11-09 20:17:08 UTC
From: IO60260@MAINE.BITNET
Message-ID: <8811100041.AA20991@ucbvax.Berkeley.EDU>
Source record: 250088

The latest issue of St-Log contains a reasonably complete list of hints that covers everything from beginning to end. (Just as an example, it covers the "When is a wall not a wall?" riddle amongst other things.

The previous two issues of ST-Log have also covered tips on how to get through Dungeon Master, both of which may be helpful to those who just started the game.

If you are interested in obtaining a copy, I know that B.Dalton stocks the magazine.

R.C. Philbrick
IO60260 at MAINE.BITNET

Disclaimer: I am in no way associated with ST-Log or B.Dalton.
I just read the magazine.

Joe Smith Greg Wageman Gerry Wheeler

Introductory information
------------------------
word = 2 bytes
long = 4 bytes
palette = Hardware color palette, stored as 16 words. First word is
color register zero (background), last word is color register
15. Each word has the form:

Bit: (MSB) 15 14 13 12 11 10 09 08 07 06 05 04 03 02 01 00 (LSB)
-- -- -- -- -- -- -- -- -- -- -- -- -- -- -- --
0 0 0 0 0 R2 R1 R0 0 G2 G1 G0 0 B2 B1 B0

R2 = MSB of red intensity
R0 = LSB of red intensity

G2 = MSB of green intensity
G0 = LSB of green intensity

B2 = MSB of blue intensity
B0 = LSB of blue intensity

Intensity ranges from 0 (color not present) to 7 (highest
intensity).

Example: { red = 7, green = 3, blue = 5 } -> 0735 (hex)

Caveat: It is wise to mask off the upper four bits of each
palette entry, since a few programs store special
information there (most notably Art Studio).

The Formats
-----------
```

<NEOChrome>

1 long resolution (0 = low res, 1 = medium res, 2 = high res)
16 words palette
12 bytes filename (" . ")
1 byte Left color animation limit (starting color number)
1 byte Right color animation limit (ending color number)
1 byte color rotation speed
1 byte color rotation direction
1 word color rotation duration (number of iterations)
18 longs reserved for expansion
16000 words picture data (screen memory)

32128 bytes total

<NEOChrome Animation>

NOTE: To get this feature on versions 0.9 and later select the Grabber
icon and click the both mouse buttons in the eye of the second R in
the word GRABBER.
Interestingly enough, some versions of NEO only require you
to press the right button, not both. Hmmm...

(palettes are stored in separate files)

32000 bytes total

<Tiny>

1 byte resolution (same as NEO, but +3 indicates rotation
information also follows)

If resolution > 2 {
1 byte left and right color animation limits. High 4 bits
hold left (start) limit; low 4 bits hold right (end)
limit
1 byte direction and speed of color animation (negative value
indicates left, positive indicates right, absolute value
is delay in 1/60's of a second.
1 word color rotation duration (number of iterations)
}

16 words palette
1 word number of control bytes
1 word number of data words
3-10667 bytes control bytes
1-16000 words data words

42-32044 bytes total

Control byte meanings:

For a given control byte, x:

x < 0 Absolute value specifies the number of unique words to
take from the data section (from 1 to 127)
x = 0 1 word is taken from the control section which specifies
the number of times to repeat the next data word (from
128 to 32767)
x = 1 1 word is taken from the control section which specifies
the number of unique words to be taken from the data
section (from 128 - 32767)
x > 1 Specifies the number of times to repeat the next word
taken from the data section (from 2 to 127)

Format of expanded data:

The expanded data is not screen memory bitmap data; the bitplanes are
separated and presented in columns. All the data for a given bitplane
appears before the data for the next bitplane. The data for each
bitplane appears as a sequence of columns, where a column consists of
one specific word taken from each line. For example, column 1 consists
of word 1 on scanline 1 followed by word 1 on scanline 2, etc.,
followed by word 1 on scanline 200.
To illustrate: The first data in the file will be the data for
bitplane 1, which consists of columns 1, 5, 9, etc., in order. The
next data will be the data for bitplane 2, which consists of columns 2,
6, 10, etc., in order.

<Spectrum 512 (Uncompressed)>

80 words first scan line of picture (unused) -- should be zeroes
15920 words picture data (screen memory) for scan lines 1 through 199
9552 words 3 palettes for each scan line (the top scan line is
not included because Spectrum 512 can't display it)

51104 bytes total

1 long length of data bit map
1 long length of color bit map
<= 32092 bytes compressed data bit map
<= 17910 bytes compressed color bit map

< 50014 bytes total

Data compression:

Compression is via a modified run length encoding (RLE) scheme. The
data map is stored as a sequence of records. Each record consists of a
header byte followed by one or more data bytes. The meaning of the header
byte is as follows:

For a given header byte, x:

0 <= x < 127 Use the next x + 1 bytes literally (no repetition)
-128 <= x < 0 Use the next byte -x + 2 times

The data appears in the following order:

1. Picture data, bit plane 0, scan lines 1 - 199
2. Picture data, bit plane 1, scan lines 1 - 199
3. Picture data, bit plane 2, scan lines 1 - 199
4. Picture data, bit plane 3, scan lines 1 - 199

Decompression of data ends when 31840 data bytes have been used.

Color map compression:

Each 16-word palette is compressed separately. There are three
palettes for each scan line (597 total). The color map is stored as a
sequence of records. Each record starts with a 1-word bit vector which
specifies which of the 16 palette entries are included in the data
following the bit vector (1 = included, 0 = not included; i.e., stays
the same). The least significant bit of the bit vector refers to
palette entry zero, while the most significant bit refers to palette
entry 15. Bit 15 must be zero, since Spectrum 512 does not use palette
entry 15. Bit 0 should also be zero, since Spectrum 512 always makes the
background color black.
The words specifying the values for the palette entries indicated in
the bit vector follow the bit vector itself, in order (0 - 15).

<Animatic Film>

```
1 word number of frames
16 words palette
1 word speed (0 - 99; higher value is faster)
1 word direction (0 = forwards, 1 = backwards)
1 word end action (what to do after the last frame)
0 = pause, then repeat from beginning
1 = immediately repeat from beginning
2 = reverse
1 word width of film in pixels
1 word height of film in pixels
1 word version number (major)
1 word version number (minor)
1 long magic number 27182818 (hex)
3 longs reserved (should be all zeros)
--------
32 words total for header

? words image data (words of screen memory) for each frame, in order

<MacPaint>

header {
1 long version number (if zero, entire header is ignored)
38 * 2 longs pattern data (anyone know how to use this?)
51 longs reserved
}
< 51200 bytes compressed bitmap data
-------------
< 51716 bytes total

Bitmap compression:

The bitmap data is for a 576 pixel by 720 pixel monochrome image.
The data is stored as a sequence of records. Each record consists of a
control byte followed by one or more data bytes. The meaning of the
control byte is as follows:

For a given control byte, x:

0 < x < 127 Use the next x + 1 bytes literally (no repetition)
-128 <= x <= 0 Use the next byte -x + 1 times

There are 72 bytes per scan line. Each bit represents one pixel; 0 = white,
1 = black.

Version of Fri Sep 23 18:14:40 EDT 1988

If this project really gets off the ground, I would probably be willing
to contribute the work I did to develop Micro RTX. And then we could
have a Multitasking-STOS, TOS replacement.

Some of you may remember when we were considering making the binaries
to Micro RTX PD. That idea is not dead.

If there appears to be enough interested parties that want to devote
lot's of work on Gnu-type ST projects like this, I say GO FOR IT!

I think you should even try to get Atari to contribute resources
like *information*, but if they won't do that, make them give
you $$$$. They claim to have plenty of that!

I am looking for several things related to the Atari ST:

1) Some type of list of all ST compatible DS disk drives (either encased or not), where to get them, and prices (if possible).

2) A public domain screen-saver program that does something more interesting than simply reversing screen colors.

3) Places that sell used hard drives.

4) An estimated price on the new TOS ROMs (if available).

Also, would the respective persons associated with the addresses, him1.cc.umich.edu and cs.orst.edu, please give me more detailed information on accessing their system files. I am rather new at FTP procedures and I can't seem to get past logon.

I appreciate all help with these items.

NeoDesk ver 2.00 has many new features, I saw the new version at the Toronto Atari fair just last weekend. Here is a list of some of the new features.

Batch File Support.

Move files.

Faster file & disk operations.

Editable Icons with edtor.

Enhanced 'show as text' dsplay, can have different size text in window + more.

Show without sorting, to see the real order of the files on the disk.

Replace Desktop pattern with a Picture.

Has a Corner Clock, Screen Saver, and Blitter control.

Printer Que, you can change the order of the que.

Multiple icons for floppy, hard, and ram disks plus batch and printer.

Warm and Cold boot from keyboard.

Takes up as little as 24K, It is larger but reduces its' self when needed.

I hope this helps a little, there is much more than that but the list would be much longer. The lst price for this product is $ 49.95 I do not know about the upgrade policy.

About 6 months ago, I sent in an old Atari 520 (a developer version that couldn't even use my TOS chips(which i sold on the net, thank you)) to Atari Customer Service w/my check for $90 and got a new 520 about 3 weeks later, no problem. Needless to say, I was very suprised how hassle free this was. The customer service reps were very helpful, but I agree that they are definatly lacking on the technical side.

Oh, by the way, I am not crazy.

>...any way to make a FUL bomb...?
I don't know of any way, but simply using spells won't work (will create a VEN bomb though). There may be some complex process using objects, but no one has broadcast such a finding so I tend to doubt it.
If you are *careful* you can get the energized powerstaff out of the area of the powergem without sealing the levels above 13 and that is about as good.

Roy Hallquist asked:
>Is there any way to make a FUL bomb potion, or must thou be content with
>those that are found...?

There doesn't appear to be any way to create a FUL bomb in this version
of Dungeon Master... (perhaps in the next..?)

At any rate, I don't know just how useful that would be anyway, as it
would destroy one of your flasks when you throw it, just like using a
VEN potion... I had much better uses for allll my flasks down on the
Scorpion and Knights levels...!

Well, I'm here to answer the question below, but I'd like to see some documentation on the above, If you have em. Bad idea to post stuff like the above without quoting sources...leads to all kinds of trouble. And post an equivalent defect-percentage for Atari, if you want to be fair.

>Is it possible to write a program that will backup the FAT and the directory

>
>A program that will backup the vital information on a disk is effective pro-
>tection against viruses and other malicious code. Is this project feasible?
>Such a program will probably make backing up a hard disk much more painless!

Yup...it's already done on IBM-PC's, which have almost identical disk formats. The programs simply create a file in a fixed location on the hard-disk (usually the LAST n sectors on the disk) and copy the FAT and directory to this file. You merely run the program at boot-up, and thus you have a FAT/Dir backup to fall back on when something goes wrong. As long as you don't re-order stuff on the disk, the file will stay put. As a matter of fact, the version I have for the PC comes with a disk reorganizer to keep everything efficient, and it automatically keeps the backup file in place, and optionally re-runs the FAT backup program after reordering everything. Of course, the program depends on the assumption that whatever screws up your FAT/Dirs won't take out the opposite side of the disk...probably not a bad assumption. And of course, if things go bad, you simply boot a disk with the recovery program, and it copies the last n sectors to the first n sectors to recover the disk...pretty simple program, shouldn't be difficult to do on the ST.

>> Well, everybody is tired of waiting for Atari to improve the ST,
>> right? Atari is hopeless. Then, why not improve it by ourselves?

Yea!
Right!

A lot of people already started (here in Germany an in France).

Turbodos seems to be an replacement for GEMDOS, David Beckemeyers RTX
replaces BIOS, XBIOS (and GEMDOS?)...
A german guy hacked TOS functions to act exactly like theit MsDOS
counterparts....

First we need a list of (documented :-) features, we would like (my list
below), later we'll just write a new operating system from it...

Do not misunderstand me (if You understand my "English" at all):
to build a new operating system featuring TOS compatibility,
multitasking, 020 support, fast code, no bugs and so on, would take
forever, right?

But that would be half the time, we wait for Atari to give it to us...

Well, let's try!

Instead of having a completely independent version of TOS, it seems that TOS might be reformed from within. Atari claims that they don't have the resources to fix everything that needs fixing (actually, to be fair, most of it would be considered enhancements). maybe Atari could let someone come in and fix the TOS source code for a cut of any profit Atari made from it -- no risk. Unfortunately, I've forgotten the name of teh guy at Michtron who wrtoe juggler, but he seems a likely candidate. We could have a Multi-TOS which multitasks, has more that 8 windows, more that 6 desk accessories, and a reasonably fast screen device driver!

I'm shopping for a computer that will satisfy the needs of both myself and my kids. Now that they're in school, they're using a computer almost every day. Most of the software, however, is for the Apple IIe, which is what the school has (of course!). Is there a way to get a comprehensive list of educational software that runs on the ST? I understand that Atari published such a list of all software within the past year. Is that available via the net? Thanks in advance.

6105. Computer Algebra II: the Summary

Newsgroup: comp.sys.atari.st
Date: 1988-11-10 16:48:00 UTC
From: ivan@rzsin.sin.ch
Message-ID: <48
Source record: 250105

Thanks to all who replied to my question about computer algebra. A few people suggested I summarise my findings, so here they are. I had wanted to wait for last weekend's digests, in case they had anything more, but they appear to have been delayed by The Virus...

I found out about three programmes (two directly from the developers). These are REDUCE, SCHOONSCHIP, and MAPLE. Of the three, my only mainframe experience has been with REDUCE (along with SMP), so I cannot compare the programmes at all, although it appears that SCHOONSCHIP might be a bit more "bare-bones" than the other two. All are ports of mainframe programmes.

SUMMARY:

o REDUCE
Available from CODEMIST Ltd., "Alta", Horsecombe Vale, Combe Down, Bath, Avon, BA2 5QR England.
Consists of 5 diskettes, includes source and executables plus the Metacomco LISP package, and a printed manual (machine-readable manual available at extra cost).
Hard-disk strongly recommended; will run in 1 MB, but takes advantage of more memory. Runs the standard REDUCE test in 240 secs (c.f. VAX 11/780, ~60 s; VAX 6240, 21 s; VAX 8650, 13 s).
Price: Stg 326 (plus V.A.T. where applicable). Price firm until mid-Dec.
E-mail contact: Professor John Fitch, jpff@bath.maths.ac.uk

o SCHOONSCHIP
Available from Topsoft, Inc., 2300 Woodside, Ann Arbor, MI 48104.
Apparently consists of a ROM cartridge -- no details of memory requirements. Written by the original author of SCHOONSCHIP, Marinus Veltman, in 68000 assembler.
Price: apparently about $400.
E-mail contact: Marinus Veltman, veltman@(Univ. of Michigan, Ann Arbor) on BITNET (I haven't been able to verify a node name for this address).

o MAPLE
Almost available from Watcom Products, 415 Phillip St., Waterloo, Ontario N2L 3X2, Canada.
See Jeff Voskamp's recent posting for full details. Port to the Atari is at the Beta-testing stage. Requires 4 MB hard-disk storage and 1 MB memory.
Price: will probably be about $400.
E-mail contact: Jeff Voskamp, javoskamp@watmum.uwaterloo.ca or javoskamp@watmum.waterloo.cdn

I will report at a future date if I ever convince the Institut to
actually BUY one of these programmes (I'm currently setting up an introductory
demonstration with mainframe REDUCE to try to raise some interest here).

Ivan Reid, Phys-Chem Inst., Uni Zuerich.

Message-ID: <8811101921.AA10708@ucbvax.Berkeley.EDU>
Source record: 250108

I have just purchased a hard drive for my ST and unfortunately have not
been paying much attention to the hard drive discussions going on here.

What I basically want to know is:

1. What is the best way to fix the 40-folder bug? I have seen several
programs: FOLDRXXX, GEMBOOT, and another. What are the differences
and which one is best?

2. Does the 40-folder limit apply only to NEW folders accessed, or also
to repeated accesses of the same folder? In other words, will the
system crash after re-accessing the same folder 40 times?

3. Is it safe to use TURBODOS to speed up my drive, or are there possible
side effects/dangers in using it?

I would appreciate any responses via E-Mail. Please do not send replies
to the discussion.

Thank you.

The Magnavox 8CM515 RGB monitor will work properly with the ATARI ST series. After looking at my CoCo 3 RGB specs, and monitor cable, I have determined that the 8CM515 has separate Vsync and Hsync inputs. However, I do not have the pinout for the monitor's 6 pin DIN jack. Do any Atarians or CoCo 3 users out there happen to have the pinouts? Otherwise, I have to tear the CoCo logic board out of the PC type case...

Also, where can I find the unusual monitor plug that Atari uses to connect to the computer? All that is necessary is the plug.

Cross-posted to: comp.os.minix,comp.sys.atari.st

I was just wondering- When using Minix on the ST, would it still be possible to access the ROM functions in the ST for GEM, etc. ? If so, I wouldn't think it would be too hard to write some sort of window system like SunView(tm) so that you could have multiple shells in multiple windows.

I don't even have an ST yet (I still have my 7 year old 800). But when I do get one, I was thinking that this would be a fun first project to work on (if it's possible).

I am having trouble getting a timer interrupt routine to work. Can anybody tell me why the following piece of code doesn't work (it's written in Mark Williams C):

```
#include <bios.h>
#include <xbios.h>

int tick=0; /* clock counter */

clock_vector()
{
tick++;
}

main()
{
int control, data;

/* have the user enter values for control and data */
printf("Enter timer A control register value: "); scanf("%d",&control);
printf("Enter timer A data register value: "); scanf("%d",&data);
/* Next install the interrupt handler for timer A */
Xbtimer(0, control, data, clock_vector);
/* Enable Timer A interrupts */
Jenabint(MFP_TIMA);
/* loop until a key is pressed printing the timer tick value */
while(!Cconis())
printf("tick = %d\n",tick);
Cconin();
Jdisint(MFP_TIMA);
}
```

I have read the section of the Abacus Atari Internals book about what values should go into the timer control register, but when I set control to a value which I think should correctly start the timer, my program bombs with from 2 to 4 bombs, and the system always hangs.
Can anyone tell me what magic values should be passed to Xbtimer, or if that is not the problem, what am I doing wrong?

From: rona@hpdml93.HP.COM
Message-ID: <480001@hpdml93.HP.COM>
Source record: 250113

I agree that a user developed operating system is a great
idea. I wish that I had enough knowledge to be of help.

I can, however, make suggestions concerning improvements:

1. Increase maximum partition size and the maximum
number of partitions possible.

2. Allow processes to be run in the background like
the & modifier in UNIX.

I hope some of you gurus make a go of it.

I think in that arcticle is a little calculation error. Should it be
4 partitions each 16 Meg per physical drive giving a 64 Meg limit.

German sales are still strong in comparisons to US sales, but that's not saying that much.

Has anyone else noticed that the few US software distributors that were actually carrying Atari ST software are dropping the ST products? They are selling off what they have on the shelves but they're not ordering any more.

Another side note: I've now noticed that Antic Software is publishing AMIGA SOFTWARE. What does "Antic - The Atari Resource" have to say for themselves now, I wonder?

Here is some of my ideas about the replacement for TOS:

The new OS (STOS) should have the ability to load fonts (i.e., GDOS)
built in. It should be able to load fonts individually, and can
resize fonts. The ability to use outline fonts is the best. Of
course, it should also be able to use the oldGDOS fonts.

The number of windows should not be limited to eight.

The CON: device should be put in a GEM window, instead of taking
over the whole screen.

It should have the ability to load desk accessories at any time (like MultiDesk)
instead of only at boot time.

The new GEM should be able to work after switching resolutions
without reboot.

Routines to support scrolling an area and redrawing windows should
be included in the new OS.

Graphic operations should be made as fast as possible.

If it can multitask, that's the best!

Things I would like to keep:

The printout quality of GDOS.
compatibility with .GEM and .IMG files.
compatibility with existing software, as much as possible.

The above is a short list of ideas I can think of for the STOS. Hopefully other
people can come out with more ideas, too!

P. S. A windowing system fulfilling the above requirements build
on top of Minix is also great!

I've got it, I like it, it's really nice. But heck, I'm a Unix nut by trade and I like hacking. And, nice as the system is, it really isn't usable for much other than hacking right now. No support for the serial port yet, no real applications, nothing more than (!) a Unix programming environment. The idea of building TOS compatibility into it is interesting, since a successful attempt would yield a lot of usable applications in one fell swoop. I really dislike TOS. Really. Intensely. But many of my reasons are pretty trivial.

For example, one thing that drives me absolutely nuts is using the backslash as a directory separator. I wish this were a modifiable system variable. It's so amazingly inconvenient... But also amazingly trivial. I haven't given up TOS yet, because my favorite application, Uniterm, onl;y runs under TOS. Ah well...

But that's all kind of irrelevant. Minix offers a lot - multitasking, I/O redirection, inter-process communications (pipes), more flexible filesystem, other good stuff. If there was any networking hardware to speak of on the market, it'd be a cinch to turn an ST running Minix into a decent workstation in its own right.

Hmm... Trying to get back to the main point... "Right out of the box," there's almost nothing for a computer "user" to gain from Minix. For a (group of?) dedicated programmer(s), it has a lot of potential. TOS, on the other hand, has an established user base, established suite of applications, etc. However, I don't see very much in the future for TOS. (What can you expect from a system that looks so much like MSDOS, another doomed dinosaur?)

>If anyone knows a not-too-illegal way around this limit, I would like
>to hear about it. I know of no way to effectively use a 300 Mb unit
>on an ST at this time.

Depends on your meaning when you say "effective use." I use Minix on my ST. Minix has no partition size limits. As such, having 300MB of disk available to me would be effective for me. If you restrict yourself to TOS, you have a problem...

If you're willing to sacrifice some storage efficiency, you might consider using larger disk block sizes. You only have 21 bits for addressing disk blocks, but if you double the size of a block from 512 bytes to 1K, you've just doubled your maximum from 192M to 384M.

>Yup...it's already done on IBM-PC's, which have almost identical disk formats.
>The programs simply create a file in a fixed location on the hard-disk (usually
>the LAST n sectors on the disk) and copy the FAT and directory to this file.

It would seem more useful, to me anyway, if it simply copied this data to any file of your choice, preferably *on a different drive.* Any virus writer who knows about this trick can just as easily take out the last sectors on a disk as the first. Keep the data on a floppy and you don't have to worry about what happens to data on the hard drive. Personally, it strikes me as silly to store a backup FAT in a file on the same disk. If the FAT goes, and that file *did* somehow get relocated on your disk, you're not going to be able to find that backup FAT, or at least not easily. This would be a pretty simple program to write...

Along these lines, I remember a program on the Apple][(Remember, the Apple][? Not the //e, //c, or IIgs. The][. }-) called Multi-Disk Catalog. This program was a real treat for people with huge numbers of disks, because it could keep track of disk catalogs ("directories" to you'n'me... }-) for many disks on a single disk. Kind of like an indexing program, but just a touch better - it stored the actual catalog itself in its database. If parts of the original disk's catalog got wiped, no problem - just restore it off this database, or just restore enough to retrieve one vital file. Very very handy.

TeX has been the text processing system of choice for many different computer systems for at least a couple years now. It's particularly noted for its math and special symbol handling capabilities, as well as its device independent output format. The TeX DVI (DeVice Independent) file format is supported on a large number of devices - dot matrix printers, laser printers, phototypesetters, you name it. Oh, of course, drivers also exist to display DVI files on screen for just about any popular computer you can find - PC, Mac, Sun, Apollo, etc... (Atari ST, of course.)

By the way, Commontex 2.9 is now available on the him1 server. (Address is 35.1.1.43, user pc7, password guest.) Look for "ctex?.arc" There is a readme in ctex-bin.arc that also describes the other arc files. All files in the package originally announced by Jwahar Bammi are here, just a bit repackaged to fit into ARC files instead of tar.

6128. Restoring default trap handlers

Newsgroup: comp.sys.atari.st
Date: 1988-11-11 13:50:51 UTC
From: javoskamp@watmum.waterloo.edu
Message-ID: <6727@watcgl.waterloo.edu>
Source record: 250128

I have a program that takes over several interrupts, including 0x102. Naturally enough I have to restore all the default vectors before exiting since this is not a "Terminate and stay resident" program. My program has two exits - the normal one and via interrupt 0x102. When I exit normally everything works fine, everybody's happy and life goes on as usual. However, when I type ^C the machine _seems_ happy until I start up something else, at which point it locks up and the only thing to do is power down. I've checked using db (from MWC) and when calling Setexc from Supervisor mode the vectors aren't being reset properly. The same clean-up routine is being called in all cases.

Any suggestions? Are there problems with using system traps from Supervisor mode?

Being an ANTIC developer, I can comment on this rather instigating comment.
I cannot, however, speak officially for ANTIC, but rather let you know what I
have learned from the people I deal with.

Bottom line: Atari sales aren't that great in the US. No news there!
The move is one to keep Antic software alive. The software part of Antic is
now (it wasn't before) a separate company than Antic Publishing, which
produces Antic and STart magazines. The new company's co-owners have decided
to increase their profits, and have, in fact, not only entered the AMIGA
market, but the IBM market as well.

Unless we wanted to see *NO* software at all from Antic Software, Inc.
(ie. the Cyber line, FLASH, SHADOW, Cad 3D, etc.) this move was needed.
I can't say it all, but Atari owners can expect more changes from Antic
Software. That *DOES NOT* mean changes for the worse!!!!!

As a matter of fact, 'Cyber Punks' are rampant and Antic's Cyber line is going
to continue to grow, despite Tom Hudson's move to IBM (to supposedly produce
Cyber-type STuff on the IBM). Almost everyday, ANTIC gets calls from people
wishing to develop new Cyber related products.

Also, another company related to Antic Software (I can't recall the name) is
importing foriegn products and marketing them through Antic's distribution
network.

I personally don't see anything wrong with preserving the ST software line by
making a *smart* business decision.

** FLAME ON **

If David Beckemeyer would stop wearing his heart on his sleeve, maybe he
wouldn't get so offended by other people's marketing strategies. Just
because he had faith in ATARI Corp. and they let him down, *DOES NOT* give
him the right to bash all companies associated with the ATARI computers!!!

Everyone is in the same boat. You just jumped ship early, and seem to still be floating waiting for a rescue party. I am sorry that RTX didn't take off like you wanted. I personally wish I was making much more money from our ATARI products, but that is why I have a real job, as a real computer programmer for a POS company. (And I program the IBM PC all day, as well as OS/9 on a VME 020 machine!)

The fact is, I have an Atari ST, I'm not rich, but I do enjoy the system. The computer is great, despite Atari's lack of developer's support (which seems to be getting much better), so I program on it. Compared to the IBM rag, the ST is a fun machine to program, that allows me much better performance and ease of programming. Not to mention it doesn't have *brain dead* assembly!!!

So, please get over it David. Bash Atari, not the companies trying to make money the best way they can!

** FLAME OFF **

These opinions *DO NOT* reflect Antic Software or Double Click Software. They are my own!!! Flame me.

See y'all at COMDEX!

6131. Looking for Word Processor (Word Perfect not quite there)

Newsgroup: comp.sys.atari.st
Date: 1988-11-11 18:19:04 UTC
From: frg@jfcl.dec.com
Message-ID: <406@jfcl.dec.com>
Source record: 250131

I am looking for a good word processing program for the ST. It
must be reasonably easy for a non-technical person to use it, and
it has to support the usual features:
Text attributes (underscore, italics, bold)
Footnotes
Automatic pagination with manual hard-page override
Adjustable page numbering (for long documents)
Mixed single and double spacing within documents
Support for Draft and NLQ modes of printing
WYSIWYG or at least no Runoff-style coding

I don't know whether or not 1ST_Word Plus does it all: THe 1ST_WORD
V1.06 that came with my 1040STf two years ago had lots of bugs, didn't
know from footnotes, and screwed up double spacing (but at least had
it, unlike 1.03).

Now I found one program which SEEMED to have it all. Word Perfect For
the Atari ST, V4.1. This is a very impressive package, with LOTS of
slick features. Sadly, the implementation is not up to the quality
of WordPerfect's PC products.

The nastiest part of WP-Atari is that it has an undocument file size
limit in the 60k range. If the file gets much longer, it might not
save, and it pretends to, so it loses your work! They're working on
it, maybe, but recommend only doing small files. Great. It once
even deleted my original pre-session file: If it weren't for DLII,
we'd have been serious goners (doing a thesis-class paper). THANKS,
SIMON, FOR SAVING OUR LIVES! (Simon Poole is the Peter Norton of
the ST world, and for free no less!)

Besides that, the overall implementation on the Atari is sloppy.
It occasionally goes nuts and gets stuck in a 1%-speed mode with
block stuck on; if you can save/exit you're okay after restarting.
The printer table for the April 15 version (which they mailed me
in Sept. from the factory) is wrong for the Panasonic 1080i, and
fixed in the 8/1 edition which they sent me last week, but the
font table which was good is now wrong, and I failed trying to make a
working printer file using elements of each... Weird.) And the
spell check did a nasty 10-bomb on me once, using the new (8/1)
version. The tech support guys asked me to figure out the pattern
of why it happens. Great.

I suppose the AtariST market is too small for WordPerfect Corp.
to devote the effort to needed to support it right. So I'm
thinking of trying yet another word proc. program. They do at least
answer the phone (if you wait long enough); they just don't seem to

understand the ST well enough to make it play. Sad -- we're so close
yet so far away. Any suggestions?

In article <26751@ucbvax.BERKELEY.EDU> morrison@renoir.Berkeley.EDU (Scott Morrison) writes:
> I am having trouble getting a timer interrupt routine to work.

Xbtimer takes four arguments: the timer to set up, the control and data values for the timer, and a pointer to an interrupt handler. You are passing a pointer to a C procedure, which is not the same thing: C procedures end with RTS, while interrupt handlers end with RTE. I don't know if MWC has a function you can call which causes your procedure to end with RTE (some compilers do), but this is definitely your problem.

Of course, the program must be able to back up to a different disk, since it makes no sense to back up to the same disk. If the FAT on that disk becomes corrupted, chances are, the backup will also be affected.

I was in the local book/magazine store (B. Dalton) at lunch. I saw a Premier issue of a video game magazine and picked it up to look through it. It is dedicated to the Sega, Nintendo and Atari game systems. As I looked down the table of contents, I said to myself "boy, these names sure look familiar". Thinking about if for about 10 seconds, I said "I know why these names sound familiar. They are all the names from Analog magazine". Apparently, Atari magazines have to diversify or die.

In article <3713@druhi.ATT.COM> dlm@druhi.ATT.COM (Dan Moore) writes:
> GemDos is still limited to 16 Meg partitions. Several of
the hard disk systems do allow you to create partitions larger than
16 Meg as long as the partition is *NOT* used for GemDos (ie. Spectre,
Minix, OS9, etc.). Atari has not said anything about increasing the
>16 Meg limit in the newer TOS releases.

The 16 Meg limit is because of a TOS bug. Ye olde 16 bit INT
truncation problem strikes again... Rumor has it that this bug
will be fixed in the new TOS, thus allowing for larger partitions.

> GemDos is also limited to 16 drives, A to P. (NOTE: The
original doc said there was a 32 drive limit.) Drives A and B
are used for floppies, leaving 14 drives for hard disk partitions.
Atari's hard disk software only supports 4 partitions per physical
drive giving a 48 Meg limit. Supra, ICD and BMS all allow up to 14
>partitions per drive, giving a 224 Meg limit.

Um, almost right. Only 12 are supported within a single physical unit,
due to a space limitation in sector 0. Only 4 are in legal space, the
other 8 are stuck in where nothing should be, but it doesn't seem to
hurt anything... Thus, a single physical drive can contain up to 192 Mb
of useful space, and an additional 2 partitions are possible elsewhere
at 16 Mb each. Total for system is 224, for one unit is 192.

One problem with this is that desk accessories probably only check the
resolution they're running at the time they load. If you changed resolutions
on them, they would probably display their output incorrectly and/or open
windows that are too big/small. In theory, it would be nice, though.
If this had been implemented from the beginning, desk accessories would
know to check the resolution whenever they opened a window.

From: omni!emh@stag.UUCP (Eric Hopper)

I have written a program which reverses screen colors + draws a
bunch of interesting moving lines. It looks mildly like Quix, but it draws
more lines before a redraw. If anyone is interested in this program, just
give me an address, and I'll uuencode it and send it there. It would also
be nice if you gave a path from a major Minnesota node to your node.

My program does have some odd bugs. It won't recognize anything
aside from a mouse movement or button press. This will hopefully be fixed,
but I am very busy, and I don't know how to get ahold of the interrupt
vectors for anything else anyways. I forgot to mention that it allows you
to set the time delay in a multiple of 15 seconds, from 0 seconds to 1485
seconds. My program is a desk accessory.

Eric Hopper (Omnifarious) Don't try to send to omni, as it is completely
unkown to any system except stag.

I wonder if MINIX on the ST will take on the same role as OS-9 on the Radio Shack Coco. It appeared there as an exotic, third-party product. Then Radio Shack adopted it as one of their own products. Now, many Radio Shack games are released on OS-9 disks.

In the case of MINIX, it has the added advantage of the source code distribution.

I am working for a company which has adapted Smalltalk80 to the Atari ST.
The newest version of Smalltalk80 supports so called user primitives which
are simply C functions that are linked to the machine.

We would like to support MWC object format, as the DRI C object format
knows about 8 char symbols only. However, the MWC manual does not mention
the exact MWC object format but only the header.

Does anyone on the net know the real object format ?
We need this very urgently!

Thanx in advance
Andreas Toenne

P.S. Smalltalk80 runs on AtariSt with at least 2 MB.
It costs 399 DM (which is about 200 US$) for students and universities which
is a real bargain.

David Beckemeyer asks:
>Has anyone else noticed that the few US software distributors that were
>actually carrying Atari ST software are dropping the ST products?

The local "Electronics Botique" chain store has moved all remaining ST
software to a small "island" display in the back of the store, and given
the former ST wall space to expanding its Amiga and Macintosh shelves...

The "Babbages" chain store in the same mall has cleared out all its
Atari software, and given the space to Commodore titles...

MicrOtyme in Ohio called the Michigan Atari Magazine to say it was pulling
its ads for Atari products this week..

I called Computer Direct today (they used to print a catalog that was half
Atari/half Apple.. they've dropped all Atari products), and the first
thing the girl asked was "What computer do you have?".. when I said "Atari",
I could hear the intake of breath to tell me they didn't carry Atari anymore..
I had to tell her all I wanted was disk storage cases...

I recently wrote a 3-part series for ST-Log magazine, and my mother called
nearly every computer store in the Metro Detroit area looking for a copy
of the first installment.. some of the answers she got when she asked about
"Atari" would be amusing, if they weren't so sad...

No... I haven't noticed anything...

The numbers I've seen for ST sales in the United States range from 250,000 to 650,000 (nice range eh?) Compute did a survey in 1986 and they came up with 350,000 units sold. Sam Tramiel has stated a figure of 275,000 and START magazine seems to use 300,000 as a benchmark figure. I have also been told that ST's go out the door at a rate of 6,000/month, a growing percentage of those going to MIDI applications. What all this means, I don't know.

I have an assembler over here that has little or no use since I got Laser C, which has a built in assembler. All I want for it is $22.00!

It is a version which is one year old or so, and I got the upgrades from Abacus by just calling them, stating my version number, and if not current, sending the original disk. This was replaced with a current one for FREE each time at no cost!

If anyone decides to buy this thing, I can just write them a letter stating that Mr. John Doe and sign it, from then on, they are the legit owner of the program (done all the time).

For a mere $30, I will throw in the Abacus book "Assembly Language programming on the Atari ST".

I paid $60 for the program and $20 for the book, an $80 dollar or so value (probably a little less now) for $30 and I will pay shipping in the US. I am not at all informed as to the cost of mailing to Canada, so I cannot jump into that one.

If you are interested , drop me a line, gimme a mesg, or a ring.

Not necessarily, Lawrence...a disaster that destroys the FAT (which is at the low end of the disk) is not likely to also take out a file at the very top end of the disk, where the FAT backup would be...however, since the FAT backup is given a filename, it should be possible to copy the file to a second disk every so often, and have an option on the restore program to take the file from another source, rather than the fixed sector locations on the bunged disk. Another option might be to allow the user to specify a second disk to write the FAT/Dir backup file to, either at the fixed location (useful if you have two drives...send C's backup to D and D's to C) or just as another file (on the theory that both disks probably won't be bunged at the same time, and the alternate drive's file system will remain usable...personally, I wouldn't want to take the chance, especially if the cause might be a destructive virus or the sort).

This sounds like a great idea. I know of a few people in this small area
who would like to have access to this information. I have heard bits and
pieces about this magazine c't. It sounds like an excellent magazine.
I have a few friends who can speak/read German so getting it would be
relatively easy for me to get it translated.

On another subject, I have heard a few months back, something about a
clone of the ST possibly coming into the North American market. This was
mentioned on another net, but since the system was supposedly imported
from the European area, I thought I would find out about it here.
Any help?

Message-ID: <28@umvlsi.ECS.UMASS.EDU>
Source record: 250251
Cross-posted to: comp.os.minix,comp.sys.atari.st

I've heard that the current version of Minix ST will not talk to Supra hard disks. However, I've also seen a message from someone who says he uses a Supra hard disk with Minix ST and has no problems. I'm not sure what to believe, but I'd like to know the answer before I buy Minix. Can the current version of Minix ST talk to a Supra hard disk? If not, is there a patch available that I could apply to the operating system to fix this?

Thanks,
-Matt

pa1132@sdcc15.ucsd.edu (pa1132) Writes:
> ...Perhaps you can accelerate the process of Atari
>people to switch to Amiga.

This is silly... most people that have picked one or the other computer picked it for some reason, and will probably stick with it (unless they encounter some overriding reason to switch). Especially if they have written a significant amount of software for their machine (it can sometimes be as hard to port some programs to a new environment as it was to write them from scratch in the first place).

Second... your statement is making the assumption that people are already actively switching. I have seen no evidence of this... I have seen frustrated users on EVERY computer I have ever used (including mainframes). However the presence of frustrated users does not imply that they are leaving the machine they are on and switching to another (some frustrated users simply become determined to "improve" on the system themselves). Also the users that become so frustrated as to dump one system often become "perpetual frustrated users" (my opinion) and will dump the new system that they have gone to just as fast, when they find it is not PERFECT either.

Third... watch out for FLAMES. That kind of comment is likely to ignite a few.

>(wha do You exspect from an operating system written in C?).
>It could be build anew (in Assembler of course), but that will take some
>time... (and will not be portable anymore).

Factors that slow Minix down (at least on PCs) are:
1) The compiler that comes with Minix produces bad code.
2) The Minix kernal is divided into several tasks which must
communicate with each other by passing messages. Message passing
is slow.
3) The disk I/O is not multi-tasking, so the system stops processing
when your disk is busy.

The bad C compiler could be replaced with a better one, such as Sozobon C.
The kernal could be divided into fewer tasks to reduce message passing overhead;
one big help would be to compile device drivers as part of the file system task.
That single-tasking disk I/O is a real bummer.

One problem with Minix: It is not freely redistributable. Cheap, yes; free, no.
I suspect a PD operating system would have a much better chance of catching on;
can you imagine a typical Atari salesman explaining to a typical Atari customer
why s/he should spend money to replace something as technical as an OS?

>I like OS/9 pretty much (run it on an 020 VME BUS machine) and would
>like to have it on my ST at home as well...

I've tried running OS9 on my ST. Very disappointing. Microware's hard disk
driver & support software don't work with my Supra drive. I managed to get it
running by using somebody else's driver, but the system crashes about every
hour and a half. Reliability issues aside, OS9 is EXPENSIVE. The C compiler
costs $500, and other software is priced similarly. Also, OS9 seems a lot
slower than it should be -- perhaps because of its redundant CRC checking, or
because the kernel makes many recursive system calls, I don't know.

I like the Minix idea, or a PD *NIX clone.

Hey, Atari! What kind of support would you be willing to give to a project
like this? Yes, I understand that you all think TOS 1.4 is the greatest thing
since 3.5" disks... but DEC feels the same way about VMS, and a lot of us
customers want an alternative. Please post a response.

6156. coco drives on st

Newsgroup: comp.sys.atari.st
Date: 1988-11-12 21:00:20 UTC
From: aking@PEBBLES.BBN.COM
Message-ID: <8811122100.AA21402@ucbvax.Berkeley.EDU>
Source record: 250256

I've been trying to attach an old CoCo Teac drive (5 1/4", 40 tracks, double sided) to my 520ST, per the notes from Ric Wheeler 23Sept88. After a little work, it will select, turn on the motor, and step. It appears to format, although I had to set the number of tracks down from 82 to 40 on 410format.prg. The problem is that it won't read data back. It appears to have trouble reading the directory.

Can the Teac (model FD-55B-01-U) be made to work with the ST? I wonder now if the data rates (and perhaps sector sizes) are compatible. Will the result, if it works, be able to read IBM compatible diskettes?

6157. IB Drive Warning

Newsgroup: comp.sys.atari.st
Date: 1988-11-13 02:13:15 UTC

Source record: 250257

I.B.Computers of Portland are selling a 5 1/4 floppy drive for the ST. I bought one of these, and couldn't get it to work. Sent it back to them to fix, and it still didn't work when I got it back. Then I saw a network note to the effect that the side select signals and drive select signals must be buffered.(Thanks to Myron Drapal.) I installed a 74LS241 and the drive started to work properly. IB Computers don't seem inclined to notify their customers of this problem, e en though I wrote them a detailled letter, so anyone considering a purchase of this drive should bear this in mind. Be prepared to modify the drive.
If you need a detailled description of the mod, send me mail.

Hello,
.
This is areply to the concept of re-writing TOS.
.
I would be very willing to work on this project. I have extensive
experience in writing assembly on the ST. Please send more information
about this. I have quite a few ideas about the way the ST should
migrate in the software area. Oh well, send info and we'll talk more
about it.

Hi,
Does anyone know why the desktop does not access GEMDOS calls
through the normal TRAP #1 calls? I tried to intercept all the
EXEC calls by grabbing the vector and interrogating the stack, but
the expected EXEC calls never came. Note that other programs which
use GEMDOS caused my routine to be executed. Oh well, thamks for
any help you can give.

Source record: 250260

Hi,
This is more about the TOS rewrite.
.
Why isn't MINIX a good idea? Because it costs money from what I hear
and the average ST user isn't going to want to pay $100 to get the
new TOS.
.
Here are some features that I would like to see:
.
- better support for hard drives
- networkable device drivers
- generalized math coprocessor support (not just the 68881)
- alternate screen support (such as the new 19" monochrome)
- mutitasking (true or juggling won't matter to me)
- much better memory management
- documented ways of doing certain things
(like changing the mouse pointer redraw routines, etc...)
.
Well, I could go on and I have a list somewhere of other things that
I have thought up over the years, but I won't bore you.
.
One thing that deserves attention now is the generalized math
coprocessor support. There should be a standard vector for
interrogating mc availability and access methods. If there was
then people without a mc would have a set of floating point routines
written in 68000 accessed by this vector. However, the people with
the math coprocessor would still get almost full speeed out of the
arrangement.

6161. Fdatime under Laser C

Newsgroup: comp.sys.atari.st
Date: 1988-11-13 03:49:01 UTC
From: bovet@hao.ucar.edu
Message-ID: <992@ncar.ucar.edu>
Source record: 250261

I'm having a terrible time trying to get Fdatime to modify
a file modification time and date stamp using Laser C. I note
that the ABACUS book reverses the order of the read and write flag
values relative to what Megamax shows but as near as I can tell the
Megamax documentation is correct. At any rate, I can read the time
and date just fine (and can verify that it matches what I find in the
DTA using FSFIRST - FSNEXT. However, when I try to write a different
value into the field, I get no complaints but the value doesn't get changed.
It doesn;t seem to matter whether I Fopen the file for read only or for
write first. Has anyone else succesfully used this call? If so, could
you please include a brief, functional, code fragment? Thanks very much!

Ray

>

Allan's right!
I've used MWC and Xbtimer, and _my_ solution was to write a little
assembly language routine that does the timer interrupt handling:
1) Don't forget to save the registers you use before processing,
and restore them after (use movem.l).
2) You'll have to handle clearing the interrupt pending, enable,
and in-service bytes:

0xFFFa07 enable A
0xFFFa0b pending A
0xFFFa0f in-service A

I believe bit 0 determines if its active or not, don't disturb
the other bits when you clear one..
(You only have to clear the in-service, the system clears
the pending one by itself).

3) rte at the end of your routine.

Hope this helps.

The whole problem with Atari is their lack of recognition for the importance
of software in the system. The success of the IBM was largely due to
Microsoft's undying support, and the success of Apple is due to amazing
internal software guru's and Microsoft again.

A better operating system would be great. We know the hardware's potential.
Magic Sac has proven that it is faster than even the Mac. But ST software
itself will never amount to much. (ie, challenge IBM or Apple) Unless of
course the Tramiels wake up and realize that Software IS everything!!!
And then a new smarter OS will be useful.

Several things can be done:
1. If Atari started giving away development info.
So that all poor (but highly intelligent) hackers will be in on it.
And we do know that lots can be produced by unknowns...
(Yes, for free. As an investment for the future...)
2. If great PD software would be recognized and incorporated into
the operating system. (ie, DCFormat can be put in place of that
awful formatter in the Desktop.)
3. (you think of something, and post it!!)

6165. Gnu GCC V1.30 available for Minix ST

Newsgroup: comp.sys.atari.st
Date: 1988-11-13 10:46:56 UTC
From: bammi@dsrgsun.ces.cwru.edu
Message-ID: <278@cwjcc.CWRU.Edu>
Source record: 250265
Cross-posted to: comp.os.minix,comp.sys.atari.st

Gnu CC V1.30 and associated tools (gcc-as, gcc-ld,
gcc-ar, gcc-nm) are running under MINIX on the AtariSt. Also, i have
ported the minix library, the library/kernel interface (st*.s files)
to this environment. Gnu CC may be used in two modes - producing code
in which integers are 16 bit quantities or producing code in which
integers are 32 bit quantities. I have done the approriate things in
the library/kernel interface to facilitate the two modes. The front
end driver (gcc) picks the correct start files/libraries according to
the mode (specified by the presence/absence of the -mshort flag). I
also upgraded the lib source before starting on this, with the relevant
diffs from the Ibm V1.2-V1.3 upgrade. Also incorporated quite a
few fixes that have appeared here lately, and found some more, that i
will post. This port has all the basic floating point support in it.
Hopefully, with the help of the net, we will build up a libm.a, building
on the basic floating support (which is the same as what was provided
in the TOS port thanks to John Denning). The same source is
appropriately #ifdef'ed to produce a Unix hosted (only SunOS V3.5
tested) cross-gcc (and the tools) for minixSt.

No changes are required to the kernel/fs/mm. I intend at some point to
do the appropriate things to compile the kernel with Gcc. It runs on a
1Meg ST, provided you cut way back on the ram disk (i am currently
using a 150K ramdisk). It certainly will not run on a 520ST. How big a
program you can compile basically depends upon how well modularized
your source code is. Under TOS i have compiled some pretty large
programs that consisted of many small to medium sized source files.

If there is sufficient interest i can package up the diffs from the
Gnu distribution and make it available for FTP and/or post it. Mail me
if you are interested.

A friend just bought his second 30MB Supra recently and discovered that the newer one works fine under Minix, but the older (8 months old) Supra doesn't. He is using the same format/utility software for each, and the only obvious difference is that the drive types were different (I think he said the new one was Seagate and the old was Miniscribe). The drive type shouldn't affect operation, so there must have been other changes in the ST-SCSI adapter as well. I hear that Supra is working on the problem, so hopefully there will be a software fix for the older drives.

>

The game's name is "Midi Maze". I first saw this one at a local Atari Expo last year (had ~10 units playing it at once.) Anyways,I purchased this game,and it's been nothing but a headache for me. Sure,the game itself is fine. But,I think there is a problem with the protection scheme and/or the disk itself. I've written Hybrid Arts several times (5,I think) telling them about this problem and possibly sending my disk for an exchange,but have not heard a single word from them. (BTW I sent my warranty card in the day after the purchase.)

By now,the warranty has expired and I'm stuck without a working copy of a program I paid $35 for. I'm going to try again to write,and if I don't hear anything I'm just going to send the disk back. I don't want to call because I'm tired of calling companies with people answering the phone who don't know anymore than I do about the product (and sometimes I know more.) I'm sure I'm not the only one here who has called a company and had to explain the actual product before the problem. You'd think the company would put people who have used the product before to answer the phones.

Now,I'd like to know if anyone else has had any trouble with this company, and what happened. I hope for the ST world that I'm the only one with this problem.

I have been called by one of the developers of Supra (W. Brown), who
mentioned problems reported by some of his customers. He himself had
no MINIX-ST and I have no Supra disk. Has someone on the net a
combination of these two ingredients at hand, with some time and
willingness to look into this problem?
I would very much like to have MINIX-ST run on the Supra drive, since
they are quite popular.

Is there a new version of "uw" for the Atari?

If there is none and there will be none, I would be interested in
the sources. I tried to reach the authors by mail, but apparently
some mailers in USA are very confused.

Source record: 250272

In a previous digest, David Rubin writes:
> What is the best way to fix the 40 folder bug?

I think that FOLDERxxx (where xxx is the number of active folder you want to add) is the standard fix around. It has been around since enough time to be considered as safe. I use FOLDR100.PRG and it eats 13K.

>Is it safe to use TURBODOS to speed up my drive?

I use TURBODOS since more than 1 year now to speed up my SH205, and I did not have any problem (nevertheless, I backup my disk regularly. Do the same thing, I found that Michtron BackUp! is okay. I know that some PD backup are better). If anybody is aware of a danger resulting of the use of TURBODOS, please let us know. TURBODOS is basically a cache (and a RAM hog, BTW). However, I wrote a letter to Atari-France to get a technical explanation about what the hell really does this utility, and they never wrote back, although they own the product.
Typical Atari user-support, I'm affraid.

Message-ID: <8811140255.AA23156@ucbvax.Berkeley.EDU>
Source record: 250273

I.B.Computers of Portland are selling a 5 1/4 floppy drive for the ST. I bought one of these, and couldn't get it to work. Sent it back to them to fix, and it still didn't work when I got it back. Then I saw a network note to the effect that the side select signals and drive select signals must be buffered.(Thanks to Myron Drapal.) I installed a 74LS241 and the drive started to work properly. IB Computers don't seem inclined to notify their customers of this problem, e en though I wrote them a detailled letter, so anyone considering a purchase of this drive should bear this in mind. Be prepared to modify the drive.
If you need a detailled description of the mod, send me mail.

I almost hate to say it, since I have seen so many people knock it, but I have used almost everything from ST Writer, thru' Regent Word, First Word, Hippo xxxx, Word Up, Tempus, Word Perfect, and Microsoft Write, and when I want to do a fast letter or memo I use First Word Plus, for professional stuff where I want excellent proportionally spaced type, with the use of the glossary to built text from boilerplate components, i.e. legal stuff with special formats, I use Microsoft Write. The more I use it and get really intimate with it's features, the more I like it. With G+Plus instead of GDOS and an SLM804 it produces truly professional copy, and quickly too. The only lasting beef I have with it is the fact that every once in a while it boots up with a one column page width and I have to reset the margin definitions when I start up. It does multiple columnns with right justification and all that kind of bells and whistles stuff. A very underrated program in my mind. The lack of an integrated spell checker may bother some, but I've stopped relying on those since I discovered how often typos aren't caught by them, since they constitute a real word (i.e. thin, then, than, this, his, hen, etc.) When I have a real long doc to proof I save it as ASCII run it thru word perfect's spell check, by far the best spell checker I ever saw and then print it thru. What about X Windows? Not the worlds best windowing environment (which is, of course, the Xerox Development Environment :-), but a damn sight better than GEM. I've just got hold of Minix, and intend to investigate porting X as a (very) background task over the next year (or two, or three ..). I expect that this will be a somewhat, um, non trivial task, but it could be kind of fun in a masochistic sort of way.

6182. More SLM804 annoyances

Newsgroup: comp.sys.atari.st
Date: 1988-11-14 15:49:31 UTC
From: Hugh_Messenger.EuroPARC@XEROX.COM
Message-ID: <881114-093413-1227@Xerox>
Source record: 250282

John,

I might as well add a few grievances of my own to the ongoing SLM804 knocking session.

1) The Alt-Help screen dump. If the SLM804 is not on-line and warmed up (ie. if the back door is open), the screen dump will just wedge. It doesn't come back when the printer does come on line, the only fix is a reboot. This is a monumental pain in the ass. Why oh why can't there be just one little line of code that checks printer status and gives the user some useful, informative feedback if the printer is off line? This is the kind of behaviour that drives me up the wall and makes me want to junk the whole @$%*! system and go buy a Mac. OK, I'm joking, but you take my point?

2) The last-page syndrome. If you double click on a document and select the print option, it prints fine except that the last page does not get printed - instead, it lurks about ready to leap out and attach itself to the front of the next document you print. This wouldn't be so bad, only as there is no FF at the end of the errant last page (which is presumably the problem), the second document gets run straight onto the end of it, thereby screwing up any page oriented formatting. Sounds trivial, but another in a long line of 'minor' annoyances with this printer. (Having siad this, it occurs to me that there may be a configurable option one can set via the control panel. If there is, I'll humbly retract this particular gripe).

3) This isn't really a grump, more of a puzzle. Occasionally in the past I have booted my machine with hard disk and laser turned off - I just want to copy some floppies or some such simple minded operation. If I do this, it is then impossible to format or copy floppies. Why so? How come just having something plugged in to the dma port affects floppy formatting, fer cryin' out loud?

I've only used a Supra drive once or twice, but I do know that the Megafile 20 not at all noisy. Depending on how quite the room you plan to put it in is all you may hear is the fan working quietly. I can't detect any noise from the HD itself (Unlike another HD I own that sounds like a F-4 Phantom ready for take-off!).

Believe it or not I wasn't trying to bash Antic. I realize it probably looked
like that, and so I'm going to make a brief posting to (maybe) clear it up.

It was more like: "See even companies that originally were very dedicated
to the Atari ST are being forced to move on and expand their horizons..."

I sincerely have absolutely no problem with Antic Software's move away
from 100% Atari software. I think it's a perfectly reasonable thing to
do. But at the same time I think it makes a pretty strong statement
about Atari's position in the marketplace.

I'm sorry about the way the message appeared to bash Antic Software. I
didn't mean it that way.

Well everybody if you feel like dropping the floppy-disc OS one
might consider GNU when it becomes ready. It is supposed to
be a full-blown UNIX type operating system with all the utilities
one might need. It will probably demand something like 1.5-2MB ram
in its initial form but that might be possible to change.
It has preparations to make people unable to restrict further distribution.

In article <992@ncar.ucar.edu> bovet@hao.ucar.edu (Ray Bovet) writes:
> I'm having a terrible time trying to get Fdatime to modify
> a file modification time and date stamp using Laser C.

Fdatime had some problems in TOS 1.0 and 1.2 -- it's been changed for
TOS 1.4 to be more sane. I don't remember exactly what the problem was,
besides the documentation having the arguments wrong... The new Fdatime
doesn't write to the disk at all: it writes to the open-file data
structure, which gets written to disk when you close the file. This
means that checking your write with Fsfirst won't work, because what's
on the disk won't get updated until the file is closed.

The correct usage is:

Fwrite(timebuf,handle,flag);
int *timebuf; /* ptr to two ints: time & date */
int handle; /* handle of file */
int flag; /* nonzero to write from timebuf */

If 'flag' is zero, the file's date & time are copied into the two ints
at timebuf. If 'flag' is nonzero, the ints at timebuf are copied into
the file's date & time fields. Since the date & time are updated each
time the file is written to, you should make this call immediately
before closing the file.

Not to start any wars or anything, but I think a major part of people's grief with Microsoft Write for the ST is that it was _way_ below all of our expectations. It's an okay bare-bones (not too many bells and whistles) WP, but for $140, it's preposterous.

It does have (in my opinion) one advantage over all the other WP's out there, and that is the use of GDOS' multiple fonts. In fact, it was my utter disgust with M.Write that led me to WORDUP, by NeoCept. Contains almost everything M.Write has, with even MORE features (graphics merging, glossary, true WYSIWYG, etc.) -- and the stunning price of $80. You really should try it sometime; The potential equvalent of MacWrite on the ST.

Does anyone know when the next upgrade for WordUp is coming out? The guys at NeoCept told me (at the Glendale Atari Faire, in September) that it would be out "in two weeks". But now it's November, and nothing. Does anybody have any news?

There is an ST clone out here in Germany: it is build of three board of
100 by 160 millimeters (Euro card size) as a "sandwich". The case is an
19 inch casette (3 HE/14TE). Very cute thing.

It is made from Atari parts ("OEM"-ST boards) and very exspensive (The
computer witout monitor, keyboard, mouse, disk, powe supply, 19" rack
and so on is about $1000).

Maybem this "190 ST" is, what You heard about.

From: why@cory.Berkeley.EDU
Message-ID: <7396@pasteur.Berkeley.EDU>
Source record: 250292

Every once in while, when I'm in WordPerfect, I notice that the screen will flicker, the entire screen will dim and brighten, giving the impression that it's about to explode! Well, maybe not explode... Anyway, can anyone tell me what might be causing this? At first I attributed this to eye fatigue, but that isn't it. And it only happens when I'm using WordPerfect, so that would seem to rule out general brown-outs or power surges as the cause, too. Hard disk activity is also not the cause. Eliminating these, does anyone have a good suggestion as to the cause of the problem?

Thank you,
Warner Young

From article <3482@jpl-devvax.JPL.NASA.GOV>, by grieggs@jpl-devvax.JPL.NASA.GOV (John T. Grieggs):
> 16 Mb per partition * 12 partitions = 192 Mb
>
> If anyone knows a not-too-illegal way around this limit, I would like
> to hear about it. I know of no way to effectively use a 300 Mb unit
> on an ST at this time.
>

There has been some pressure from developers on Compuserve to get Atari to "fix" the bug that limits partitions to 16 megabytes, instead of the 32 megabytes that the present FAT could presently address. They've been resisting it, based on the scenario:

"naive" person A with a "fixed" OS builds a hard disk with big partitions and then fills that partion so that more than 16 megabytes is used. Then that hard disk is taken to a machine that doesn't have a "fixed" OS and tries to use it; that machine proceeds to scramble the disk

(or other similar situations). One suggestion (made by somebody at Atari Canada?) was a different partition type, so that "old" machines would ignore big hard disk partitions.

(And of course if the GEM filesystem was made compatible to MSDOS/PCDOS 4.0, then more than 32 megabytes could be addressed...).

Currently there is no way to address more than 192 megabytes as a GEM filesystem. However you can use any amount of space as a raw disk (supposedly you just give the appropriate flags to the Rwabs call...)

> hard disks. However, I've also seen a message from someone who says he
> uses a Supra hard disk with Minix ST and has no problems. I'm not sure
> what to believe, but I'd like to know the answer before I buy Minix.
> Can the current version of Minix ST talk to a Supra hard disk? If not,
> is there a patch available that I could apply to the operating system to
> fix this?
>

Could this be a situation similar to what the PC-Ditto people just issued
a patch for? PC-Ditto (the IBM PC emulator for the ST) has its own drivers
for hard disks. Apparently some versions of ST DMA port adaptor boards
are slower at responding to commands than others; in particular the PC-Ditto
note talked about older Supra boards. PC-Ditto recently issued a patch
that changed timing parameters in their driver to make it work on Supra's.

I am selling my obsolete 20Mb Seagate to a guy with a PC. The problem is that it is full of my personal files and I don't like the idea of swapping it temporarily with my current drive just to erase the files on it. Can the PC owner easily get to my files or must he format the drive first in order to access it?

Any piece of information is appreciated.

Thanks,

Esa Matti Lippu

6196. Rumored Atari 68000 Game Machine

Newsgroup: comp.sys.atari.st
Date: 1988-11-15 02:05:56 UTC
From: al710@unh.UUCP
Message-ID: <761@unh.UUCP>
Source record: 250296
Cross-posted to: comp.sys.atari.st,comp.sys.atari.8bit,rec.games.video

Has anyone heard anything about Atari producing a 68000 based
home video game system? Rumors flew several weeks back, but
I've heard nothing new lately.

Specifically, if such a machine does/will exist, I was hoping to get
answers to these questions, before I settle on buying a Nintendo
or Sega:

* How does it compare to the Sega, Nintendo, and Atari XE systems
available now? What are the specs for these 3 machines,
and what are they for the new, rumored Atari box? Along these
lines, what kind of input devices (light gun, 3D specs, etc.)
will be available?

* When will it be released? (Rough guesses -- plus or minus
1/2 year -- are welcome).

* How about cost and projected game availability (within, say,
1 year of release)?

Post or e-mail replies. I'll summarize if the response warrants it.

>some mailers in USA are very confused.

I talked to one of the authors a few months ago (for the Lachman version...) It sounded like he had made a few changes (even file xfer capability), but I still haven't gotten the sources from him. I've been using screen lately at work, so haven't had a dire need for uw, but if/when I get the sources I will be looking into adding RGB support. I have one of the original RGB monitors and I prefer it over using my monochrome. Of course, if anyone has already added RGB capabilities, please post it ASAP!

6199. GCC for MinixST now available for FTP

Newsgroup: comp.sys.atari.st
Date: 1988-11-15 06:38:17 UTC
From: bammi@dsrgsun.ces.cwru.edu
Message-ID: <284@cwjcc.CWRU.Edu>
Source record: 250299
Cross-posted to: comp.os.minix,comp.sys.atari.st

My mailbox has been overflowing ever since this morning. At last count
i got 43 requests for Gcc for MinixST. It is available for anaonymous
FTP from dsrgsun.ces.cwru.edu (129.22.16.2). Its in the directory
~ftp/pub/minix (Note: there is also a directory ~ftp/pub/atari, that
also contains gcc stuff, but that is for TOS not Minix). I got three
request to post it on the net from people who do not have FTP access. I have
offered to copy the files onto floppies for them, instead of flooding the
net (and the subsequent re-posts). If you do not have FTP access
please send me Email and we can arrange floppies.

arpa: bammi@dsrgsun.ces.CWRU.edu
compuServe: 71515,155

PS: Here is the README file

Here is the GCC distribution for MinixST. Only context diffs are provided
where possible. The same source may be used to make a unix (only
SunOS 3.5 tested) hosted Gcc based cross development system, by using
the appropriate makefiles (provided). Further, GCC may be used in two
modes, 16 bit integer or 32 bit integer mode. The driver program `gcc'
will pick up the correct library objects appropriate to the mode. The
mode is selected by the presence/absence of the `-mshort' command line
arguement to `gcc'. Please note that even while linking 16 bit integer
object files using `gcc' or `gcc-ld' the `-mshort' flag should be used to
link in the 16 bit library objects.

** ACKNOWLEDGEMENTS **

John Dunning (jrd@stony-brook.scrc.symbolics.com) did the hardest
part, the port to atari/TOS. BIG thanks to him. Frans Meulenbroeks
(meulenbr@cst.prl.philips.nl) contributed a lot of info and sample
code for minixST. Thank you very much.

This distribution contains the following subdirectories:

bin/ Atari Minix executables
lib/ Library Object files
include/ Include files (diffs + additional files)
src/ All the src diffs and additional files

bison/ Frans Meulenbroeks diffs for bison
dir/ Doug Gwyns portable directory package
etc/ Dhrytone stuff

gas/ Diffs + additional files for gcc-as
gcc/ Diffs + additional files for for gcc, gcc-cpp, gcc-cc1
lib/ Diffs + additional files for Gcc MinixSt library

util/ Source for gcc-ld, gcc-ar and gcc-nm

Each subdirectory contains a file `README.MINIX' that gives further
details about the subdirectory contents.

All the files needed to use the compiler are provided in the distribution,
except the include files, for which the diffs are provided. You can recreate
all the include files by applying the diffs in the include subdirectory
to the include files that came with minixSt.

If you want to recreate all the sources you will need

- gcc V1.30 distribution
- gas V1.25 distribution
- Atari Minix sources
- Latest Bison distribution

all additional files and diffs are provided in the distribution.

> ...John

In the first place, NULLFILL and (FATSPEED & DISKFREE) do different things. In the second place, there is no "legal" way to do what DISKFREE does. (Note that Zoomracks, at least, doesn't work with it.)

I don't know if FATSPEED and DISKFREE do the same thing or not.

In any case, none of this is necessary with TOS 1.4. I can't recommend them even as stopgap measures, but if you want to take risks with your data, that's your lookout.

Great! This is exactly the kind of "It works, so use it" philosophy
which makes it so hard to improve TOS in a backward-compatible way.
Please do not rely on crap like this in your programs. If you do, don't
expect them to work in the future. Maybe I should make sure the hack
described above stops working, but I'm not vindictive or petty, so I
won't.

6205. Re: FTP Arc Transfers

Newsgroup: comp.sys.atari.st
Date: 1988-12-15 21:54:23 UTC
From: sbigham@dukeac.UUCP
Message-ID: <1165@dukeac.UUCP>
Source record: 250005

Yet another monkey wrench to throw in the works:

Is the ARC used to arc these binaries the same as the arc found on most Unix systems? Or what is this ARC 5.21 thing the last person mentioned? The only other ARC program I've seen is (you guessed it) ARCed.

I have some file called ARCX.TTP given me by a friend of mine who does this sort of thing regularly (and who's unfortunately at another college at the moment). Does it bear any relation to anything discussed above (or anywhere else in the newsgroup, for that matter)?

6206. Using a Video LaserDisc Player as a CD-ROM on an Atari ST.

Newsgroup: comp.sys.atari.st
Date: 1988-12-15 22:15:32 UTC
From: covertr@gtephx.UUCP
Message-ID: <4046fbd0.14e07@gtephx.UUCP>
Source record: 250006

I just read a message in rec.video that the new Pioneer CLD-3030 video laser disc player can be used on an apple //e and a Macintosh and an IBM PC clone as a CD ROM. My question is:

Does anyone know how to use the Pioneer CLD-3030 video laserdisc player as a CD ROM on an Atari computer???

It seems that if a video laserdics player can be used on a Mac then it should be possible to use it on an Atari. Maybe it could be used in the Spectre 128 Mac emulator?? Anyway, the local price for a new CLD-3030 is $1200 which is the same price as the Mac CD ROM. The advantage of buying the video laserdisc player is that not only can you play your movies, but you can have a CD ROM long before Atari releases their CD ROM (if Atari ever does release one!!).

So, how about, is it possible?? Has anyone done this??

Get PC7:arc.ttp off of him1. This is probably the only non-arc'ed file you'll
find there. (Still need to transfer it in binary mode, of course.) This file
is version 5.21b, the latest I've released so far.

I have downloaded many arc files from UMICH.EDU using FTP. I too had problems with the 'Bad Header" messages until I started using the mainframe to De-arc the files and THEN downloading them via UniTerm! Those of you who are having these problems may want to try that. I suspect that these files were originally arced on a mainframe and that our ST version of arc isn't compatible.

Until recently, ARC did not exist on most Unix systems. However, within the
past year, three major versions have come out, based on MSDOS ARC versions
5.12, 5.20, and 5.21. If your Unix ARC doesn't claim to be any particular
version, it is probably based on 5.12. I released 5.20 and 5.21; the former
to alt.sources and the latter on comp.sources.unix. If you don't have it,
get it from uunet or any other unix archive site...

>I have some file called ARCX.TTP given me by a friend of mine who does this
>sort of thing regularly (and who's unfortunately at another college at the

ARCX will only extract files from archives, and it won't extract squashed
files. ARC 5.21 will both create and extract from archives with squashed
files, as well as the usual crunched and squeezed... (Too bad it's so slow.
Still looking at it to see what new things I can do with it. Should have
5.32 in a couple days; look for it in a week or two.)

I can't really help you with your first problem dealing with poking screen memory directly with the right colors but I can help with getting advice on good Atari ST books on the subjects you listed.

Assembly Language: Programming the 68000 by Steve Williams (Sybex Inc.)
Compute!'s Atari ST Machine Language Programming Guide

Internals: ST Internals (Abacus)
The Concise Atari ST 68000 Programmer's Reference Guide (Glentop)

VDI / AES / TOS: Compute!'s Technical Reference Guide, Volume I: VDI
Compute!'s Technical Reference Guide, Volume II: AES
GEM Programmer's Guide (Abacus)

I have all of these books in my ST library but some of them do contain some typos. The most accurate books are those produced by Compute!.

I have written such a translator. It enables you to print (rs232, file,
centronics) either the full pi3 image or a portion of it. You can
select true size, max size, zoom factor, portrait/landscape, epsf compatible
for latex inclusion, # of copies...
If someone wants to try it, ask for. Now, rsc are in French, but I can make
an english version.
bug: loads only PI3 image.

The ST's RGB port is a standard analogue RGB port. I have connected a
Ferguson MC01 TV/monitor to mine with no difficulty. The points to watch
out for are:-

(i) The monitor must be able to display Analogue RGB
(ii) The monitor must have a loudspeaker (unless you want to
use an external one with an amplifier)

I hope this will be helpful.

Stephen Usher.

In Germany Omikron Basic Rev. 3.0 is shipped with every Atari. Other
Atari owners can get it for 19.95 DM (~ 11.-$). While GFA has advantages
in graphic applications (very minor ones) Omikron is very strong in
mathematical applications. I even think of using it myself.

Why don't you just try and complete the game the proper way without cheating. The Dungeon Master editor which came on an issue of ST-AMIGA format is just simply a tool for the author to make more money from gullable people who think that it will help them complete the game easily.

ps The copy you get from the magazine isn't the finished version anyway. With it you can only modify levels 1 and 2. The game isn't really all that difficult anyway, just use some time and a lot of perseverance and you will eventually win, and gain a lot more satisfaction in the process.

pps

The object of this area is to gain a certain number of gold keys.
The Matrix does not go on forever but has some strategically placed
Spinners (makes you spin on the spot), and the large button at eye level
once pressed opens up a hallway somewhere in the Matrix.
And yes you can make it down the corridor and into the room before the
corridor closes again-this is the Hit - and - Run area of course.
One hint is to try and keep all four members of the party unumcumbered.
ie normally at the bottom of the character when chosen it tells you
how much the character is carrying in white. If this is in yellow then
the character is encumbered or if the writing is in red then the
character is either very encumbered or half dead.

By the way, while on about DM can anybody tell be where the c***p about
HIZZZZA not being attacked by the Dragon came from, because if you
have HIZZZZA in the party and you go down to level 14 where the dragon is,
then it may not attack you but by Christ it attacked me.

ps Don't try attacking the Dark Lord on level 13 because you will be there
all day trying to kill him. After 8000 damage on the guy I decided this
was not the right method.

Spectre 128 does run Hype-card -- I saw it myself, and so did 1000+ rabid
Atari fanatics in September.

Emulating the 128K ROMs in the Mac is the whole reason for creating Spectre
128 in the first place. As such, any Mac program that runs under the 128K ROMs
(and that's 99.8% of them B-) will run under the Spectre.

> The compiler returned with a type not compatible error. So, how do I
>assign an 8bit value to the variable ? I am new to Modula2, so it may
>be trivial; but it is very important. Any help would be greatly appreciated.
>(I'm using TDI-Modula2/ST by the way)

The type BYTE in TDI Modula-2 (and most other modulas that have this type) is identical in all respects to the type WORD save one: it is only one byte instead of two (or four on some machines). If the example had been

```
VAR
i: WORD;
BEGIN
i := 90H;
```

then the problem might be more obvious to you: type WORD (and type BYTE) are NOT assignment compatible with ANYTHING that is not also of type WORD (or BYTE).

If you want to get your code past the compiler, try:

```
i := BYTE(90H);
```

Hope this helps.

Another possibility is the GNOME.ACC desktop acessory. I don't remember where I downloaded GNOME.ACC since I don't have a USENET account at home. I only have access to usenet from work (on an Apollo workstation w/o a floppy dirve!). Anyway, you could possibly find GNOME.ACC on GEnie. If it isn't on GEnie I could upload it to GEnie.

Just let me know if you need me to upload GNOME.ACC to GEnie.

I wrote this about 6 months ago and never got around to posting it. I think it answers all your questions. Since it is not source or binaries I post it here.

Doug.
<><><>

the time spent in arbitration.

THE HARD DISK PORT

The Hard Disk Port is a 19-pin D connector - apparently completely
unavailable through normal commercial channels. I made my own from a
metal-shelled male DB25 connector as follows:

- remove and discard the metal shell revealing that the pins are
held in place and insulated with two loose plastic retainers;
- remove the pins from the retainers (for once you can lose a couple
since you will end up with six spares);
- using a fretsaw or a fine hacksaw remove one end of both retainers
leaving 19 holes;
- replace the pins and glue the retainers together.

You now have the connector you need. It has no mounting ears but the
retaining force of 19 pins is quite substantial. If this is not adequate
you could perhaps ingeniously salvage the metal shell somehow.

The pins on the Hard Disk Port are connected as follows (pin one
is at the upper right of the connector facing the rear of the computer):

1-8 DMA data buss bits 0-7 (bidirectional)
9 Hard Disk Controller Chip Select (_HDCS) (output)
10 Interrupt Request (_IRQ) (input, internal 1k pull-up)
11 Ground
12 Reset (bidirectional)
13 Ground
14 Acknowledge (_ACK) (output)
15 Ground
16 A1 (output)
17 Ground
18 Read/_Write (R/_W) (output)
19 Data Request (_DRQ) (input, internal 1k pull-up)

The Hard Disk Port is connected directly to the DMA chip WITHOUT
ANY BUFFERING on most pins - be careful,
a small mistake (e.g., static) could blow your DMA chip. The system reset
line is also directly connected to the port meaning that accidental shorts
reset your computer - very irritating.

INSIDE THE DMA CHIP

The DMA chip is accessed through memory-mapped registers:

ff8604 R/W 16 bits When bit 4 of the Mode register is zero a read or
write access to this word causes a read or write
cycle on the DMA buss. If bit 3 is set the Hard
Disk Chip Select controls the cycle; otherwise,
the Floppy Disk Controller is selected. R/_W is
set according to the type of the CPU access and
A1 is set according to bit 1 of the Mode register.

NOTA BENE: what is called A0 in the DMA chip is
called A1 on the Hard Disk Port. For some reason,
if bit 7 is not set no DMA buss cycle will take
place.

When bit 4 of the Mode register is one the internal
sector count register is selected. This register
counts down the number of 512-byte blocks that have
been transferred. When the sector count register
reaches zero the chip will cease to transfer data.

ff8606 R 16 bits Status word:
bit 0: 1 if error.
bit 1: 1 if sector count is zero.
bit 2: 1 if _DRQ is active.
If this word is polled during a DMA operation the
transfer will be disrupted. End of transfer must
be signalled with the _IRQ signal. The status is
cleared by toggling bit 8 in the Mode register.

ff8606 W 16 bits Mode register:
bit 0: not used.
bit 1: A0; state of Hard Disk Port line A1 (sic)
during a DMA buss cycle.
bit 2: A1; used for Floppy Controller only.
bit 3: HDC/_FDC chip select; if this bit is 1
the _HDCS chip select will be generated;
otherwise the Floppy Controller select.
bit 4: If one, select the the internal sector
count register for access at ff8604.
bit 5: Reserved; set to zero.
bit 6: Disable DMA when set; this is not used by
Atari.
bit 7: FDC/_HDC transfer select; if set DRQ from
the Floppy Controller is acknowledged;
otherwise, DRQ from the Hard Disk Port.
This bit must also be set to get a DMA buss
cycle for some reason.
bit 8: Write/_Read; if set, data will be transferred
out of memory; otherwise, into. Toggling
this bit also clears the DMA chip status.

ff8609 R/W 8 bits DMA Address Counter High byte.
ff860b R/W 8 bits DMA Address Counter Mid byte.
ff860d R/W 8 bits DMA Address Counter Low byte.
The DMA Address Counter must be loaded in Low, Mid,
High order.

There are two eight-word FIFOs in the chip; one for buffering
read operations and one for writes. The FIFOs are not flushed automatically
so you can only transfer data in multiples of 16 bytes. Actually, use
512-byte units like the sector count register does.

The DMA chip has no interrupt capability; This is ickky, but
cheap. End-of-transfer interrupts must be generated by
the external controller and are masked and vectored by the 68901 MFP
chip on the General Purpose I/O Port, bit 5, interrupt level 7. The
MFP chip interrupts are controlled with the XBIOS calls 'mfpinit',
'jdisint', and 'jenabint'. 'jenabint(7)' and 'jdisint(7)' will
enable and disable the DMA interrupt. 'mfpint(7,dmahandler)' will
initialize the vector to 'dmahandler', wiping out any earlier one.
If you want instead to simply test the state of the interrupt
request line, without taking any interrupts you can test the MFP
GPIP data register. Read a byte from fffa01 and mask with $20; if the
result is zero there is no interrupt.

Because the floppy controller shares the DMA chip you have to
be very careful about two things: 1) do not leave DMA interrupts enabled
accidentally or floppy operations will call your DMA interrupt handler;
2) turn off the floppy check routine while using DMA by jamming a 1 into
FLOCK=$43e to prevent this periodic operation from screwing up your
transfers by altering the DMA chip registers.

TIMING

These timing contraints are my interpretation of sketchy,
preliminary-looking Atari documents dated "27 September 1985". If
someone at Atari can give better figures, please inform me.

There are two separate types of transfer on the DMA buss:
processor cycles, which are initiated by the processor, and DMA cycles,
which are initiated by the external controller. The processor
initiates a DMA transfer by waking up the controller with a few command
bytes then gives it control of the DMA buss. The controller then uses
the DMA buss as long as it needs it and returns control by interrupting
the processor.

Processor cycles are controlled by the _HDCS, R/_W, and A1
lines in the usual fashion. On a write cycle, the DMA chip gives you
60 ns of setup on A1, data, and R/_W before asserting _HDCS for about
250 ns, then holds for no more than 20 ns. On a read cycle, you get
the same setup for A1 and R/_W, and you must give the DMA chip 100 ns
setup oe data before _HDCS is retracted. Hold time should be less than
80 ns.

Data cycles are initiated by the external controller by asserting
_DRQ. _ACK will be asserted by the DMA chip no more than 240 ns later.
_DRQ may then be retracted. _ACK is asserted for about 250 ns. In a
read operation (data from controller to memory) data should be setup
60(?) ns before _ACK is retracted and held for 50(?) ns. In a write
operation (data from memory to controller) data is valid 60 ns before
_ACK is asserted until 60 ns after _ACK is retracted. _DRQ for the next
cycle may not be asserted earlier than 240 ns after _ACK has been
retracted.

INTERFACING IT

This interface transfers a byte into the the DMA chip whenever a rising edge is seen on the data strobe input. This interface cannot coexist with a hard disk because it will respond to commands intended for the hard disk. Bear with me, we'll tackle that later.

Rather than attempt to render several schematics in ASCII I will describe the circuits and let you draw the schematics. If the instructions don't make any sense you probably should not attempt to make the interface. It's all very simple if you know exactly what you are doing; if you don't - you're dead.

A SIMPLE, READ/WRITE INTERFACE

If all you want to do is read and write bytes it is very simple: You simply use the Chip Select, R/_W, and A1 lines to select two write registers and two read registers. If you need more than that all you have to do is use A1=0 to select an address register which selects the register you get on a cycle with A1=1. One thing that you have to consider is that the ST writes to the Hard Disk Port several times during its booting procedure, presumably to determine if there are any hard disks connected. Apparently, if no interrupt is received in response to these writes the ROM assumes that no controller is connected.

In my interface there is a mode register which is accessed when A1=0. It has two control bits and two bits connected to a decoder which determines which of three other registers are selected when A1=1.

ADDING AN INTERRUPT

If an interrupt is needed (probably why you want to use this port) you need a flipflop to store the interrupt state and some way to reset it. I used a 74LS74 for the flipflop with a diode on the output to get the open-collector action. This diode is not needed if there is no other device on the Hard Disk Port. (But don't scrimp on a diode...) I reset the interrupt with any access to the mode register but other methods would work as well. Make sure that the circuit will always leave reset with the interrupt cleared. I arranged this by having a circuit enable bit in the Mode register, which is cleared by system reset. If you screw up on this your floppy will not work because the same interrupt is used for both floppy and hard disk controllers. I learned a little about the file system the hard way while debugging this interface - I recommend getting the interrupt reset system right the first time.

ADDING DMA

Once you can write to your mode register adding DMA transfers (at least for read operations) is very simple. All you need is another flipflop to do the Data Request synchronization and a 3-state octal latch (74LS374) to hold the data. Connect the output to the DRQ line with a diode as with the interrupt flipflop. When data is available clock it into the data register and clock a zero into the flipflop. This generates a data request for the DMA chip. When it gets around to it the DMA chip will assert _ACK, which means it

is ready to accept the data. Since you have the _ACK signal connected
to the three-state enable pin on the data register the data is driven
onto the buss. You also use the _ACK signal to set the flipflop.
When the DMA chip no longer needs the data it will retract _ACK and
you can begin another transfer. Spurious data requests are not as
nasty as spurious interrupts because the DMA chip does not listen to
hard disk data requests if it is listening to the floppy disk controller.
Naturally, if there is a real hard disk out there, there had better not
be any spurious data requests.

CO-EXISTING WITH A HARD DISK

I do not own a hard disk; therefore, the suggestions in this
section are totally untested.

eight
The Atari-defined protocol allows seven different controllers on
the DMA buss. In order to make an interface which will not interfere with
other controllers you must understand the protocol. Each command is
initiated with a processor write cycle which sends out a Command Byte (A1=0)
on the DMA buss. The most-significant three bits contain the controller
number and the remaining bits contain an operation code. The controller
whose number matches the controller number in the Command Byte responds
to the operation code. Some operations require parameters, which are
sent as Data Bytes (A1=1) following the Command Byte. The controller
generates an interrupt after coping with each byte. After the last Data
Byte is sent the controller takes over the buss for the DMA transfer.
When the transfer is finished the controller generates an interrupt.

In order to keep out of the way of other controllers on the buss it
should only be necessary to select your interface with a Command Byte with
the proper format. After that use data bytes as you wish, since all other
controllers will not be selected.

GOOD LUCK!

Using this information anyone with any experience in interfacing
can produce a working DMA interface. Best of luck and drop me a line if
you find this useful.

=>
=> There isn't a bios function 0x7f. But it is a useful bios call
=> if you intended to patch the bios handler on the ST. When the ST bios
=> or xbios handler receives an illegal function number it returns an error
=> code and a pointer to the bios/xbios function pointer table.
=
=Great! This is exactly the kind of "It works, so use it" philosophy
=which makes it so hard to improve TOS in a backward-compatible way.
=Please do not rely on crap like this in your programs. If you do, don't
=expect them to work in the future. Maybe I should make sure the hack
=described above stops working, but I'm not vindictive or petty, so I
=won't.
=

lighten up, allan...

i was not advocating its use nor do i even plan to use it in my own stuff
i just wanted to know what was going on...

i do, however, appreciate your frustration. i have just found out how
relying on undocumented stuff is bad. on my 1040 i used to use GEMBOOT
(i know, a BIG no-no). well, now with my mega4, gemboot does not work.
only trouble is now i have to reboot the system every 1-2 hours of use
because the unpatched os is so bad and tos 1.4 is not ready for release
(i assumed all the memory mgmt/OSPool issues have _FINALLY_ been resolved?)
with atari selling mostly all 1 MB or larger machines these days,
i would expect THIS CRAP TO FINALLY GO AWAY. and what about stupid cp/m-era
(64k or less) restriction on command line length? how about a Pexec2()
fcn so we can get into the 90's already?

allan, you've been one of the few good/positive things in the whole
scheme of ST things please DONT get vindictive. just keep striving (as you
have in the past) to improve things. i agree that undocumented thiings
used are at the risk of the user. the free market should weed them out
if end users have a problem. the REAL problem is there are very few
end users who upgrade their ROMS (even if they could :^) that using
weirdnes will more than likely never be a problem anyway. i know
you are in the middle of the "they used an undocemented/illegal practice
so screw them" and the "atari doesn't support its developers" dilema.
```

don't bother flaming me, i have calmed down. you should, too. it's not worth an ulcer or heart attack...

6227. Spectre 128 (was Re: Software that Spectra 128 will not run

Newsgroup: comp.sys.atari.st
Date: 1988-12-16 18:22:58 UTC
From: stowe@silver.bacs.indiana.edu
Message-ID: <2872@silver.bacs.indiana.edu>
Source record: 250027

Aric,

Spectre will run Hypercard on a 1040 with older versions of System/Finder.
(I think I'm using 5.4/3.2) If you use the most recent you will run out
of memory.

I believe the Gadgets by Small, Inc RT on GEnie has a list of software
that will and won't run in its BB area. There aren't all that many things
that won't run, except badly behaved games. The Gadgets RT is on page
690 on GEnie. To get into the BB area, you can give the command:
M 690:1
or signon with
USERID,PASSWORD,690:1

When you get in there, try SET CAT 7 and then NEW to see what topics have
new messages.

All I can say is what I've said many times before: Don't believe anything
you read in the press! Believe your own eyes - when you actually see a
picture and review of the subject product. This applies to ANY company,
not just Atari!
I sometimes think some reporters get a bit bored, so they take 10% of each
of their last 10 conversations, not necessarily with Atari, and consolidate
them into a "new product specification". Then they go to their random
vendor generator to find a name to attach to it! [:-)]
As I have said before, I promise we will make formal product announcements
on this and other nets when a product is shippable for at least alpha or
beta/developer use.

A very Merry Christmas to all our readers (this, you CAN believe!)

Roy Good/Atari

I have the interface from Berkely Microsystems, the BMS 100
and am very pleased with it.The advantage is that you can put any kind of
IBM-type drive on it.I have a 15 meg tandon and a 40 meg Vertex both
running together.If anything happens to either one of them,or heaven
forbid,both of them.(and someday it will) it should be no problem finding
inexpensive drives to replace them.

Ric-----a very satisfied customer.

6230. FTP Arc Transfers

Newsgroup: comp.sys.atari.st
Date: 1988-12-16 23:08:05 UTC
From: yz2y@vax5.CIT.CORNELL.EDU
Message-ID: <17577@vax5.CIT.CORNELL.EDU>
Source record: 250030

Thank you everyone for your responses to my FTPing troubles. I'm happy to say that the problem appears to be solved, thanks to a suggestion by Howard Chu. It seems that since I am using Kermit in a VMS environment rather than a Unix environment, I have to set the filetype to 'Fixed' instead of 'Binary'. That did the trick, 'cause I just finished downloading and successfully de-arcing 3 files from him1. The ironic part is that I still didn't have 'binary' set on Uniterm!
Thanks again, Howard and everyone else, for helping solve a 2-month long nerve-racking problem. Boy, don't you just love/hate (pick one) it when the hardest problems get solved by the simplest solutions!

Happy Holidays,
Steve Coco

The best way to get these .ARC files from umich is to FTP them (binary) to the UNIX machine. If you have an IBM PC on the network, simply FTP the files directly to the 3.5" disk on the IBM -- the Atari can read this disk directly and un-arc the file. I have been successful this way.

It is not necessary for UMICH to uuencode its files. This would not be desirable since uuencode increases the size of the file by about 35%, meaning longer transfer times and more disk space consumed on UMICH (and less space for the programs). If you need to, it is best to uuencode the file after the ftp, then use Kermit to get it to the Atari and uudecode it there.

6234. Re: Software that Spectra 128 will not run

Newsgroup: comp.sys.atari.st
Date: 1988-12-17 04:41:02 UTC
From: pv9y@vax5.CIT.CORNELL.EDU
Message-ID: <17578@vax5.CIT.CORNELL.EDU>
Source record: 250034

What I'm interested in is a new equivalent to the Translator One, since I can't stand the concept of working with Magic format disks. The Translator was pretty slow, but considering the speedup that the SPectre supposedly has, it seems reasonable to assume that such a beast could be done by David Small, Wizard at Large. I also would prefer to avoid Data Pacific after the various complaints I've heard about their business practices. So what's the deal? Is it really possible to get a Spectre with 128K ROMS and some sort of translator to read Mac disks, and if so, how expensive is such a combo? And can it be obtained through mail order since there isn't an Atari dealer within a couple hundred miles of Ithaca any more? (Except maybe in Syracuse, where I never go because mail order is easier).

Thanks for any information!

Adam

6235. HyperCard on Spectre 128? YES!

Newsgroup: comp.sys.atari.st
Date: 1988-12-17 17:23:11 UTC
From: ajy2208@ultb.UUCP
Message-ID: <263@ultb.UUCP>
Source record: 250035

I was fortunate enough to attend the First Canadian Atari Users Convention in Toronto last month (November 6th) and got to go to a seminar about Spectre 128.

David Small has broken up with Data Pacific (I'm sure you already know this) and started his own company, Gadgets by Small. Spectre 128 is essentially the latest revision of the Magic Sac. The biggest difference is that it uses the 128K ROMS as opposed to the older versions using the 64K ROMS. This means it will work with most of the newer software, INCLUDING Hypercard.

We were told that the programs Spectre 128 has problems with are Games (only 50% run) and MIDI Programs. (no need to emulate MIDI programs when the ST has such a rich supply!--Same with games!). The user interface for Spectre 128 is MUCH better than the older Magic Sac.. What I mean, is that before you enter the MAC world, you can set all sorts of options using drop down menus.

Since I go to a school that uses a LOT of Macintoshes (sigh), I plan to purchase Spectre 128 as soon as funds allow.

I know for a fact that HyperCard *does* work with Spectre. There is
a full list of what works and what has problems in the Gadgets by
Small base on GEnie - if I remember I'll scan through the listings
and post here.

Pete

p.s. The list of what doesn't work is much shorter than what does <grin>
And most of the problems are traced to using differnet combos of
System/Finder. Also, any program that doesn't work Dave Small
gets to work and fixes ASAP. Spectre started with 1.51 software
and its already up to 1.75! And upgrades are mailed free.

6240. Seeking ST & ST MIDI info

Newsgroup: comp.sys.atari.st
Date: 1988-12-18 19:40:00 UTC
From: jacobson@uxe.cso.uiuc.edu
Message-ID: <45700007@uxe.cso.uiuc.edu>
Source record: 250040

I have a friend who is looking for a computer to do MIDI work with. He is looking at either the ST or Amiga. Myself I have the Amiga, so I am not well versed on the ST but I do know of its strong history in the MIDI and Music area so I am recommending he at least look at it seriously.

I have some concerns about the things I have read here over the net about apparent problems of company support, lagging sales and efforts in the US. I have read also those notes (and have heard elsewhere) of what looks like a large exodus of ST developers away from the machine. What I would like to know for the sake of my friend is more definate information about what the facts are concerning the lack of dealers (and support), whether the desertions by developers are as bad as some say, and so on. I am concerned if the notes and rumors I hear are at all true, then I should forwarn my friend of the "orphaning of the ST". Support in terms of developers and dealers is getting strong for the Amiga, but these notes I read here make me wonder about the ST. I know that the dealership support here in Champaign Urbana has been pretty absent (I believe the "dealer" is an ST enthusiast who sells "mailorder" stuff out of his home but I don't hear much about him). At the same time I remember early during the ST-Amiga Wars the rumors and iduendos about Commodores problems, potential demise, and the persistent myth about software lack that was hard to shake even once the software became abundant. So I want to make informed recommendations to my friend about his choice of a first computer, one hopefully that is in the market firmly in terms of dealer/company/developer support. So if the negative stuff I have read/heard is exaggerated I would like to hear so from you who know your ST and where it currently stands. I would appreciate email on what you know about the real facts on Atari Support, dealership problems (such as lack of), developer support (new software or if developers have largely abandoned the ST?). I don't want to make the mistake of taking what could be merely rumors/bad press to my friend as he decides on a computer. I like people to make informed decisions on computer choices- not colored by rumors, company propaganda, etc.

Also if anyone of you out there have a list of ST music software, with descriptions of what it does I would like to get a email copy (if you have such in a file on your systems). I have given my friend several long lists of the daily growing Amiga music stuff, but I know that with the built in MIDI port, and the ST's initial lower price, many musicians went for it strongly and the software appears to be a little more mature for the ST. Any information on MIDI software for the ST would be much appreciated (lists, reviews, and the such).

Thanks for your time in reading this, and for any information you can email me that I could give to my friend. I think both the ST and Amiga are the best computer choices out there, but I would like for more information

on the negative things I have mentioned above in order to have a hopefully better informed perspective on what is really true. Rumors of the negative type tend to grow and get enlarged out of perspective, and I am wondering if this is the case for the ST.

From: steve@pnet51.cts.com
Message-ID: <415@orbit.UUCP>
Source record: 250041

If Atari ever sends me the replacement for my ST (hey, folks, I'm still waiting), and if I make it through the holidays without going into bankruptcy, I'd like to hack together a low-budget hard drive. What I'm thinking of is:
* Atari's host adaptor, which at least one dealer will sell me for $60.
* Adaptec 4000, which I think Computer Surplus will sell for around $80.
* An ST-506-type 10MB hard disk, which I see advertised for around $90.
* ICD's formatting software, which is free.
* A case from a junk electronics shop.
* Cables, which I may be able to scrounge.
* A power supply (cost unknown).

The whole package should be up and running (if it runs at all) for under $300.

Now, to the point of this note: Is there any reason why I should NOT put together such a system? Warnings about pitfalls and hidden gremlins would be welcomed. (To my pnet51 address, please, since thelake, my ST, is still off the air.)

First of all hexadecimal constants in Modula-2 are designed by an appended H.
E.g. 90H or 0FFH.
Then you write your data whith BConOut and that takes a character.
If you import the appropriate items from BIOS, the following should work:

VAR ch: CHAR;
BEGIN
ch:=CHAR(90H);
BConOut(HSS,ch);

You can also give character constants in octal, that is ch:=220C, but for Midi
this is not so fine.

When I saw this note, I reached to the shelf beside my ST and
grabbed my copy of the August issue of ST World, and started to
hunt for the article by Robert Bob Mulholland.

I could not find it. I looked again. I even read the index :-).

Is ST World publishing different editions of its paper?
The one I have is marked

August 1988
Vol III, No. 8, issue #24
ISSN 0888-1057

and is published monthly in Roseburg, Oregon.

Can anyone shed more light on this?

>a binary file without having binary mode set on Uniterm also.
^^
You can definitly only transfer binary files with UniTerm Kermit if you have
binary mode set (the 8th bit is explictly stripped if binary mode is not
turned on) (but uuencoded files are not binary in this sense).

> For the past month or so, I had been unsuccessfully trying to transfer
>Arc-ed files to my ST with binary mode set on Uniterm (as well as everywhere
>else). The only response I kept getting was BAD CHK errors on Uniterm. Then,
>one time I accidentally forgot to enable binary mode on Uniterm, and lo &
>behold it was transferring!!

Typical situation where this will occur is:

UniTerm 8 Bit, no parity

Serial connection somewhere along the line != 8 Bit, no parity

7 Bit text transfers will work with this combination, 8 Bit binary
will not! (setting the RS232 port to the proper settings will force
the transfer to 7 bit binary with prefixing).

Since I wrote this note I did have a chance to talk to the local "dealer" (he only sells 1040's and 520's, Megas cost too much for him to meet dealer requirements). He indicated to me that the "developer exodus" is mainly US. Since Atari has currently concentrated on the European market where they can sell most of what they make, the US market is pretty negletected for now (he has hard time even getting 1040's). He seemed to feel that European sales and software development are where most things are going on. He hopes that someday the US development of software will pick up again, but did indicate that most of it was low to dead for now. Again I am interested in any more details on this----and if anyone can confirm the info I got from the local dealer (who is an ST enthusiast and student at U of I).

Also he indicated to me that my friend who wants to do MIDI applications should plan at least on the 1040, since the better applications need 1 MEG to operate fully. Is this correct, or could he get by with a 1040. The price on a 1040 is too high for his budget (the dealer can only get a few and cost is high right now). Thus if he chooses ST could he get by with a 520 ST for MIDI applications??????

Also below you can find my net addresses, forgot to put up when I sent this note yesterday.

The Spectre 128 will run Hypercard just fine.

I don't think Dave has a current list of what doesn't run on the
Spectre 128. (Considering the number of Mac programs it's almost
impossible to generate the list. No one has all the programs to test.)
A short list is: no midi software, no music software (sound isn't
supported yet), anything that requires AppleTalk will fail, a most copy
protected programs won't run.

If you are interested in specific programs you should ask
Dave Small. He has an account on Genie and Compuserve. He can also be

> won't.

It just thrills me to see Atari programmers saying they will
break things just for fun. But they are never petty or vindictive.

Of course the fact that this was done about 4 years ago, when no
one at Atari would admit that people might need to patch bios/xbios
code, doesn't matter. Or the fact that 2 years ago an Atari programmer
said this was a useful feature and would be left in. Oh no, such
ancient history is unimportant. What matters is that the current
programmers don't like it.

Try checking the background on things before you start
complaining. There are a lot of things that happened before you started
at Atari which you don't know about.

Dave is currently working on a new version of the Spectre 128,
the Spectre GCR. This new version will include additional hardware to
handle reading, writing and formatting Mac disks. Disk I/O should be
about the same speed as a real Mac. Dave is hoping to release the
Spectre GCR sometime in the spring of '89.

Currently you can use the Spectre 128 with the Translator One
(from Data Pacific). This is slow but does allow you to directly read
and write Mac disks. I would recommend that you use Spectre format (ie.
ST readable) disks as much as possible. They are much faster than Mac
disks with the Translator One. Just use the Translator One when you
need to transfer files to or from a real Mac.

Ok, I'll bite, what is Calamus. We are really a UNIX shop but use
the Atari and Publishing Partner (the old one with well defined bugs)
to produce PostScript for inclusion in our flyers and stuff. We have
also used it to produce some other flyers.

But, I had one version of PageStream which I sent back. I would be
happy with old PP with the bugs fixed but that doesn't seem like what
they have planned. So, what is Calamus? Or, the real question for
us is, will it produce PostScript?

Quad op-amps aren't exactly spectacular chips. In the case of the st mouse,
such a thing would be used as a comparator to produce crisp, sharp pulses.

Now, if you want to find out what chips might be inside the mouse (I have no
idea since it's been a while since I opened one up), you can take a look for
yourself. Comercial chips have a part number and manufacturer printed on
the top of the chip. Quad Op-amps are fairly standard chips so part numbers
would be standard and replacements easy to find.

However, if you have the notion of mouse construction, then it's not nearly as
simple.

I'm suprised at you Allan... It has nothing to do with seperate
installable handlers. Hint: It pays attention to shift keys....

[rosenkra@hall.cray.com (Bill Rosenkranz) writes...]

> (with madmac) everything works fine. what is this puppy and what other
> undocumented treasures are worth knowing about?

This is how one obtains a pointer to the bios (or xbios) jump tables.
This is actualy a -totaly- unintended fallout case that just happens to
occur because of the way the bios jump code is written... Pass it
instructions to call any bios function that's not in the table, and it
will, as part of its error checking, realise this and return. That the
pointer to the bios table just happens to be in one of the registers on
return is just a fortuitous side effect...

The author probably adds $44 to the pointer and then saves the long it
points to. This is a portable method for obtaining a pointer to the bios
function that returns the keyboard shift status... The reason for doing
this is to allow a program to test the kb status while inside an
interrupt. (Something that can't be done by just calling the bios...)

> 'legally'... whatever that means.
> ...John

WRONG!!!

While all three speed up the system, they are three totaly(!) seperate programs with very(!) different capabilities... DISKFREE has its own share of bugs and problems...

To try and clear things up:

NULLFILL:

Cute hack that shorts out the main memory-clear loop in the bios. Really(!) speeds loading programs if your software can take the strain (drastic change in environment)....

Problems: Most programs expect that memory to be cleared. May cause disasterous and/or subtile problems without any warning.

DISKFREE:

Good program to speed up any program that uses the Dfree call in gemdos. Its -only- purpose, to prevent the long pauses while the system tries to figure out how much free space is left on a hard disk.

Problems: Not accurate. You will find different values listed for the amount of free space on some disks with and without DISKFREE installed. Can (very rare) cause 64k of memory to be lost out of your available memory on installation.

FATSPEED:

Replaces part of the gemdos fat scanning routine which looks for free clusters for saving new file data. Very effective at removing the longer and longer delays saving files as your hard disk gets more and more full... Also includes redirection fix and DISKFREE style fix.

Problems: Not the most legal program I've ever seen, but I haven't had any problems I can trace directly to using it... May

not be installable on some new TOS versions, but it tells you if
that's the case... Also, you shouldn't need it (or any of the
other three programs) after TOS 1.4 is released...

If you want a repacement for DISKFREE that -is- accurate, drop me a
email message. I wrote DSKFREE2 that fixes the accuracy problem and is
much cleaner in how it installs itself. On the other hand, I don't use it
much anymore because I'm now using FATSPEED most of the time...

> it returns the pointer in A0.

All correct up to this point...

> You need this pointer if you are going to
> have your own code handle the bios/xbios traps.

Wrong!

There are better methods for doing this... Using this method the way
many people have been using it makes it impossible to use many other
useful resident programs. Bypassing the bios vector chain just to install
your own program is not necessary at-all(!) and definately isn't friendly
to other programs that use the bios vector...

> This is a trick Dave Small and I used in the MOUSE program in STart
> #2 or #3. MOUSE kept the mouse out of the menu bar unless you pressed
> the right button.

I've seen the code for this program. While interesting, it isn't
useable with Flash or any other program that uses the right mouse button
for it's own purposes. Someone else took it and modified it to allow
using the right button for other purposes, but it was still incompatable
with many resident programs because it used a very bad installation method
(bypasses the bios vector chain which means that -any- bios vector-using
programs loaded before it was are no longer called after this program gets
its hooks into the system).

If anyone wants a copy of my own version of this program which works
with everything including the mouse modifier prorams, feel free to drop me
a note (PLEASE read the mail warning at the end of this msg first.). If
there's enough interest my program, I'll post it to the comp.binaries
atari.st newsgroup.

Please don't get me wrong Dan... I have the highest regards for 99% of the software that you and Dave Small have written. I just don't want these TSR hostile methods to get out any further. There's already too much incompatable software out there... And from what I've seen, none of the incompatabilities are necessary.

I just got (haven't 'unwrapped it yet') my first MIDI compatable
keyboard (Yamaha PSS-680), my question is (small fanfare, synthesized
of course)

what PD software exist for the ST ?
what patch libs exist for the PSS-680 ?
what experiences have people had with $oftware for MIDI editing ?

please email me since I don't get to read this group very often

thanks

Greetings,

I am about to become the proud owner of a free 1040ST with mono monitor. Yes, Free! I talked my Dad into buying one two years ago, and now he has upgraded to a Mega 2. Bless his heart, he decided to give me the 1040 :-) :-)

To get to the point, I would like to know what magazines are published in Europe. Subscription rates, content, etc etc. I understand the ST market is much livlier in Europe than here in the US. (I am a Unix/Network type, not an ST hacker, so please forgive me if I am wrong)

I suffered the same fate when I bought a Sinclair QL: all my software and magazines came from England and France. Does anyone have any suggestions as to the best mags to subscibe to?

Thanks in advance,

A proud new ST owner!

6258. Specific ST MIDI quest. (info neede

Newsgroup: comp.sys.atari.st
Date: 1988-12-20 05:14:00 UTC
From: jacobson@uxe.cso.uiuc.edu
Message-ID: <45700009@uxe.cso.uiuc.edu>
Source record: 249908

Thanks to those of you who have already responded to my questions about the ST, and MIDI applications on the ST.

In particular letter told me of a person who has an Amiga 1000 and 2000, as well as a 1040 ST, who prefers the ST for MIDI work. I have sent email asking more about why, but I am curious. Are there any of you other ST users on the net who are into MIDI who have Amigas or use them also who find reasons for choosing the ST over Amiga. I like both machines and don't intend to start flame wars again. I really honestly want to know which would be best for my friend to purchase. If one or the other is significantly better I would like to know why, or if they are about the same that info would be helpful. I want my friend to purchase what is best for him, so knowing how each performs (good points and bad ones) is essential to an informed purchase.

Below I want to list the specific things my friend wants to do with MIDI on the computer he chooses. I would like to know if most software or any software on specifically the ST can do what is required. In additions I have some questions about the price to purchase computer and software which does what my friend requires (he has a limited budget to work with).

MIDI requirements:

1) Keyboard used is a Ensonic ESQ-1. Is software generic enough to be used with it, or is it specific to only certain keyboards?

2) Needs a sequencer which allows what he calles transcribing. This means that the sequencer allows the MIDI keyboard input to be printed out as notes (on a scale). Are most packages sequencers? And do they allow what my friend describes??? He has seen it on other MIDI setups, do the ST (or Amiga) allow this?????

3) He wants to be able to edit in patches to his compositions that were input from the MIDI keyboard. Do most MIDI applicatons do this or allow it???? If not all, which ones allow this (as well as the requirements of item # 2 above)????

4) What are the prices of applications which meet the requirements above??? (see items below)

5) Costs are a big question. My friend has a total maximum budget of $1000 for purchase of the computer, monitor, and needed MIDI software. Can this be done with the ST???? The local dealer thought he could not get by with a 520 ST, but would need the miniumum of 1 MEG of ram that the 1040 requires. Unfortunately the dealers cost of this machine which is in hard to get supply

is a little steep (at or slightly over $1000-which puts us over
budget already just for the computer-nothing left for hardware)
Is a 1040 really needed for what my friend wants to do or would
a 520 suffice????

Any info you could provide to answer these more specific questions would be
most appreciated. I don't know much about MIDI on the Amiga I use, and am
even less informed about it on the ST. But I would like to provide the
information which is balanced and tells my friend whether he can do what
he wants with either the ST or Amiga, for what he can afford to spend.

Happy Holiday to you All!
M680XX machines for ever!

What I have read suggests that Calamus uses vector-scaled fonts. The key question is: Whose fonts? Real fonts, or some amateur crud? (I regard the GEM fonts that I've seen so far as thoroughly hideous.)

How about DeskSet? I understand that it uses Compugraphic fonts (which were crud 10 years ago, but have been greatly improved). What about speed of screen redraws?

Hello everyone!

lakesys is back to normal & now we're working on the netlib software. When
all is ready I will post to this newsgroup. NETLIB IS NOT AVAILABLE YET.
For now I'm answering mail to netlib by hand. A number of requests still show
up every day. PLEASE be patient.

I have been receiving a number of requests from the Continent which have julian
in their bang path. When they get here they have mangled addressses & when I
reply *every* one gets bounced back from the site in Toronto. See below for
details....

Hopefully netlib will be better than before when it is functional once again.

Marty Wiedmeyer

uunet!marque!lakesys!martin
uwvax!uwmcsd1!lakesys!martin

==========

This is a condensation of a number of mail error messages which I have
received in the past month. They are really the *only* ones I got, everything
else seems to have gone through OK.

They were generated by my replies to requests for files from netlib.

(Mostly in response to Phil's question about what Calamus is...)

I've got some info on Calamus, but it's at the store, not here. I'll upload it tonight (tying string around my finger) for folks.

In a nutshell, Calamus is a German DTP program, done by Ditek and marketed by ISD. (Note: ISD is keeping a keen eye on illegal copies, and has made no bones about dropping marketing if a lot of unauthorized copies start floating around. PLEASE don't. It's too good to screw it up for the rest of us.) It involved 3 years of programming by 14 programmers, and is pretty darn solid. It has crashed, but only when Ralph has kept on beating it after it captured an error. (It captures its own...) It's icon based, and does nifty things like rotations. The extended version will have approximately 100 fonts available, and will be fairly modular. If I remember right from the article, the coming modules WILL do Postscript, but as I said, I will have to u/l it. The first part, now available from a dealer near you, lists at $299.95. I think it will blow PageMaker (and PageStream, which we, too, returned) out of the water.

Dave Small is currently feverishly working on Spectre GCR. This is a hardware/software package that will allow *direct* read/writes of Mac disks ala Translator only much faster and much more reliably. Dave says the hardware is finished and he is currently putting the software together, then all it needs is FCC approval (unlike the Translator which was marketed without - one reason why Data Pacific doesn't make it anymore :-]) - estimated release date is April/May 89 and a price of under $250 (!!!) is rumored for the whole thing!

Pete

p.s. Just to clarify, GCR is Spectre 128 only upgraded and with the hardware necessary to do the read/writes. Dave promises a liberal trade-in for curreny buyers of 128 towards GCR.

6268. Modula-2 on Minix ST

Newsgroup: comp.sys.atari.st
Date: 1988-12-21 00:04:00 UTC
From: ggf@jsoft.UUCP
Message-ID: <291904@js.UUCP>
Source record: 249918
Cross-posted to: comp.os.minix,comp.sys.atari.st

Look at the following code and see what seems different about it.

```
MODULE hello;

FROM Terminal IMPORT Write, WriteLn, WriteString;
FROM Minix IMPORT exit;

VAR x: INTEGER;

BEGIN
WriteLn;
WriteString('Hello world');
Write(07C);
WriteLn;
exit(0);
END hello.
```

It is Modula-2 on Minix!!!!!.

What Jefferson Software has is a version of our linker running on TOS that produces minix executable code. There is a lot of work to do, for example the Minix library only has read() write() and exit() hooked up. HOWEVER, once you can write a 'hello world' program, the rest is cake.

It was not hard to get the test program up and running. I did find it a little slower than the Idris version. I think Idris was a little easier because the docs for Idris covered much of what you have to do to interface the system. The information for Minix is there, but spread out through the source and the book.

The sections of the book I read were:
system calls p22
interprocess communication p89
message types p95
messages for memory management p230
messages for file system p300
executable file format p411

The source I read:
/h/callnr.h
/h/type.h
/lib/stcrtso.s
/lib/stsndrec.s
/lib/call.c
/lib/read.c

/lib/exit.c

and the source to relmix. I would have liked to have seen more on the way minix relocation information is built. I just used the TOS relocation info with changes that the startup needed.

Minix is nifty. I enjoy working with it and look forward to doing more. Jefferson Software wants to see about putting shared libraries into JSM2 and doing a version of JSM2 that follows Motorola's binary standard. (* Posix compliant *) I want to do them on Minix first.

Well, tis the season to be jolly. I sure am!!!

I am not sure if this is the place to post this, but it is the closest catagories that I could find.

A couple of years ago, I bought an atari 5200 when it was the "best" game system that they put out at the time. They promptly discontinued the unit and came out with the 7800. At one time an adapter was made to run 2600 cartridges on the 5200, so I know it is possible to get new games (albeit lower quality graphics).

What I would like to know is that adapter still available (and will it work with 7800 cartridges) or better still what is the pinout for the edgecards of the cartridges for the 2600, 5200, and the 7800.

Is there any interest in addons for this game? Or am I the only one who hung on to one? Are there still suppliers of game cartridges for the 5200?

Please send replys to the address below as I do not normally read these news groups.

Mr. Pratt seems to be complaining about programmers using TOS in an illegal
way. Perhaps if Atari had ever bothered to publish good, widely available
documentation his complaint would be valid. Given Atari's disinterest in
documenting their machine I don't think Atari should complain too loudly
when folks make mistakes.

6272. DBMAN 4.0 Report Problem

Newsgroup: comp.sys.atari.st
Date: 1988-12-21 14:24:49 UTC
From: ted@banyan.UUCP
Message-ID: <370@banyan.UUCP>
Source record: 249922

I have encountered a problem when attempting to generate a report that subtotals fields when more then 12 fields are specified. DBMan 4.00 just won't generate the subtotal's or grand totals for the fields following the 12th column (or maybe 13th). I have tried to call DBMan's makers (VersaSoft I believe) on several occasions, but with no answer. Are they going/gone under? In any event, we paid $90.00+ for the 2.xx to 4.00 upgrade and would like to get a solution to this problem. Has anyone out there had the same difficulty with the report generator? Is there a fix? and finally is VersaSoft still in existance? (if so, would anyone have a phone number for them that gets aswered?).

Thanx for the help in advance....

Ted Bailey....

Back in 1985 we bought 3 520ST's and the developer's kit. At first, we received some info from Atari about the dev.kit, the last of which (I think) was the eprom set. Since then, approx 2-3 years, there has been nothing at all. Does the dev.kit require re-registration annually ?? Has there been any further info distributed in the last 2-3 years ?? The last I heard was that the bug-ridden C compiler was not to be replaced and the appallingly badly photo-copied documentation was all there was... Oh, and there was a compiler bug-list with workarounds...

Does anyone from Atari(UK) read this news-group ??

This may have been seen before but, please don't flame. I am an amiga owner and resently purchased Dungeon Master. I'm having difficulty completeing level 5. I have asked the readers on the amiga newsgroup but, I guess since this game is very new to the amiga no one has yet reached level 5. I have received request for help on lower levels from others in the amiga community but as yet no one has helped me. I know this game has been around a bit longer for the atari so here goes.

Level 5 has me stumped. I can't get all the peices I need to solve the riddles on level 6. In particular, the room with the transporter. No matter which way I turn I always windup at the entrance to the room. Can anyone help?

Also I seem to only be able to kill the purple worms and other strong creatures by using many fireballs. I can't seem to kill them just by fighting them. Is there another way?

Any help will be appreciated even hints on lower levels after 5. Thanx in advanced! Happy Holidays!

No, we're not petty or vindictive. What makes you think we are? I *didn't* say I would break things just for fun. It is more than possible that a future, seemingly-harmless change to the code in the trap handler will make the described hack stop working.

This issue illustrates the thing which has hamstrung improvements to the OS from Day 1: whenever we talk of making something better, people complain that they were relying on the old, undocumented, bogus behavior. Want to know why I can't speed up Pexec? Because people rely on the entire heap, not just their declared BSS, being clear. Want to know why I can't get rid of Malloc limitations? Because people use memory they don't own, and also rely on multiple Malloc's returning contiguous memory.

Who promised that this "feature" would be left in? I have been here more than 2 years, and I never heard about it. Worse, it was not commented in the code, which is the final arbiter of what has been promised. Blame whoever made that promise, not me.

etc., etc...

I don't know if this will be a big help, but I too have experienced problems like what you describe. My solution was to play with cable lengths and move the host adaptor away from the drive/controller. At 12 inches, I was okay. At 4 inches I had trouble. Also, I tried to route the cables so that would go directly away from the host adaptor. The bottom line is, the system can be highly susceptable to noise. And what was really funny was that I never had any trouble with my fairly slow 20 MB drives, but when I put the 300 MB drive on there, I had to get very careful.

Co-workers of mine have used the exact same drive on their ST's and haven't had any trouble. Anyway, I would try moving things around rather than just shielding.

GOOD LUCK!!!

> The whole package should be up and running (if it runs at all) for under $300.

Yes, I think that you should go ahead and build your own drive if you've
got the time. However, I personally wouldn't bother buying a 10 MB
drive. How much more would a 20 MB cost you? If the answer is $50-$70
I would go ahead and buy the extra capacity up front. You'll probably
want it before long.

Good Luck!

Ron Abramson

Source record: 249929

I don't have time to reply to this note but, I JUST CAN'T HELP MYSELF!!!

IN MY OPINION:

There is plenty of good software available for the ST. Also, most of this software is very reasonably priced!

I've rarely had to contact Atari directly so I can't evaluate their support. Once when I did ask for the answer to a question, someone from Atari called me back in less than a week and I was satisfied. Thank you, Atari. Most of the support I've needed has come from fellow users and they have been GREAT! If your friend has access to the net and/or a users group, I can't see that support will be too much of a problem unless he plans to do something far more technical than I've attempted.

I'm not sure if developers are abandoning the Atari, could that be because there is a pretty good base of software already available? For just about any standard application you can name, I can probably mention a good (maybe not great) software product that will meet the needs of most users. So, maybe that's the reason? Would you develop another "C" compiler when there are already several top quality compilers available?

I can't recommend MIDI software because I don't use the stuff. But really, I just have to get back to work! All in all, the Atari still seems like a pretty good value to me.

Ron Abramson

I would strongly recommend a 1040 color system as a starter (and a damn good starter at that!) It can be easily found for around $850 new and better used. It would include 1 meg of RAM and an internal DD drive and would take care of 95%+ of the software out there. If you decide thats too much then drop the color monitor and go for a mono - one of the best mono monitors out there. Thats should cut a good %140-200 from the price. I would not recommend a 520ST because it only has 1/2 meg and much of the up scale software needs more than that and upgrading to 1 meg or beyond is costly (but not too difficult) so you may as well get all the RAM you need right off the bat. If you have a little more to spend then by all means get a Mega 2 system - its Atari's new standard machine and a mono system can be easily found for as little as $1,299 complete!

6284. Spectre 128 and LDW POWER Problems

Newsgroup: comp.sys.atari.st
Date: 1988-12-22 05:07:00 UTC
From: 01659@AECLCR.BITNET
Message-ID: <8812220937.AA29124@ucbvax.Berkeley.EDU>
Source record: 249934

1. Spectre 128

I finally received my Spectre 128 to graduate from Magic Sac. However, any programs that require 128K ROMs (EXCEL 1.5 and HYPERCARD) will not run on either my Mega 2 or my 1040ST. I get the message that a system error has occurred (#26 I believe). This is definitely a pain since I bought Spectre to run 128K codes.

I phoned Gadgets by Small and was greeted with Christmas music and the message that Gadgets is closed until January 3, 1989. Jeez, I really want to play with HYPERCARD over the holidays and I would REALLY appreciate it if ANYONE can give me a clue as to why the codes that need 128K ROMs will not run (Oh yes, Red Ryder 7.0 will not run under Spectre either and I really need a telecomm code to talk to our VAX). PLEASE, anyone - HELP!!!!!!!!!!

2. LDW POWER

In only three weeks of use, LDW Power has managed to destroy three different worksheets during saves. Big chunks of my sheets have been vapourized (have the gone to the same place as the TT or the ATW?). Has anyone else had LDW blow away parts of sheets?

Quick answers to these questions would be highly appreciated.

P.S. Does anyone know why UNITERM requires a numeric keypad key to be followed by <cr> on my 1040 yet one is supplied automatically on my Mega?

>
>Great! This is exactly the kind of "It works, so use it" philosophy
>which makes it so hard to improve TOS in a backward-compatible way.
>Please do not rely on crap like this in your programs...

I know Dan pretty well and I like him, but in this case I have to agree with Allan Pratt. The reason I'm posting a followup though is becuase this sort of "philosophy", as Allan calls it, also is part of the reason why "clean" BIOS trap handlers are dificult to implement too.

In order to be compatible with these types of programs, the trap handler must implement all the documented functions as well as the undocumented "features" too. There are safe and legal ways to intercept BIOS traps that are TOS/ROM independent. So why do some people cheat?

Sometimes the "legal" ways aren't as fast or as compact as the "cheating" ways, so programmers can be lured into these practices. Often the pressure comes from the Users who want it FAST FAST FAST and TINY TINY TINY. Then when the next TOS ROMS come out, everybody's bitching becuase their nifty programs don't work anymore. But in the long run breaking the rules is bad for everyone, and limits the potential for future success of the very machine we all love so much.

A.J. Yarusso writes:
>Most people who criticize Atari's don't have an Atari and are VERY
>biased... oh well, such is life.

I've found that generally people who criticize Atari machines who DON'T own an Atari machine are generally mis-informed, ill-informed, or just plain ignorant of the capabilities of the machines. Many times they just can't believe that a "game machine" can be capable of much more than playing "Pac-Man". When shown the true capabilities, many times they are quick to show an interest, especially when they find out just how inexpensive that kind of power can be. The problem comes when they don't want to be bothered learning what an Atari computer can do. A lot of times, they'll say that if it was any good, they would have heard about it before... and there's the true problem... the manufacturer of what is arguably the BEST value in low cost computers does NOT, for whatever reason, tell the world about their machines. It falls to "evangalists" to spread the word, and it's an uphill battle..

Among people who DO own Atari computers, you'll ALMOST NEVER hear them criticize the MACHINE itself...

From: silvert@dalcs.UUCP
Message-ID: <3122@dalcs.UUCP>
Source record: 249938

Two events have gotten me agitated about viruses -- getting an infected disk from a friend in Germany, and getting a 60 Meg Supra for my birthday. I have several programs, including George Woodside's VKILLER (which is a beautiful program by the way), for checking floppies, but haven't heard of anything that will help with a hard disk.

My concern is that I might download a program which will infect my HD. It seems that the only security is to run all programs only from floppies, but this is pretty drastic -- like using Saran wrap all one's life. Some information on viruses would be appreciated, along with advice on how to minimize risk to a HD.

I had posted an article asking for hints on level 5 of Dungeon Master. Well, I recieved a few excellent hints. I'm glad to say I've completed it and am well through most of level 6 now and on my way to level 7. Thank you all for your help. With that experience (level 5) I should be able to think through most other riddles as I continue. I just have one last concern. Should I pick up the following items or not. It seems they don't do much for the party:

Helmets -- add weight but do they protect?
Shields -- " " " " " "
You can block with them but seems to be
a waste of time since it slows fighting.

wands -- SPell shields don't seem to help much
Chocker -- Found on level 5 what's it for?
Clothing-- ie, gunda, elves stuff, tunic etc.
Potions -- found on level 5 ie. dain, another (name?)
I drank these but nothing happened. How
about the green one (poison cloud when thrown)

My guess is these are used further down the dungeon, yes,no?

PS. The dungeon Master hint book I bought ($15) it stinks! All it really helps in is describing SOME of the items you find. The ST LOG magazine is excellent (Oct, Nov, and Dec issues).

THANK AGAIN TO ALL WHO RESPONDED

I agree. I DO own an Atari and IT did do most of the things I wanted
it to do. I DID DO a lot of shopping before I bought it 2.5 years ago.

But the promised additions to it and the sometimes BETTER THAN THOU
SOAP BOX STYLE of the people at Atari and those who represent them on
this net has ended this evangelist's support.

I've owned Atari for 6 years and I doubt that I'll ever buy another one
and will influence my associates to not buy one either!

I'm tired of being the VERY LAST ONE, yes the VERY LAST ONE as a consumer
to whom atari lends an ear and tries to satify.

They are interested in if I'm satified only and only if it affects their
bottom line to any major amount. And if it doesn't affect their bottom
line they couldn't care less.

SCH

An X-evangelist and letting everyone know about it X-customer!

You'd loose the wager if the C program used the dLibs (public domain) C
librarys for the ST.... You can free memory blocks at random locations
from here to doomsday and the machine will fall apart from old age before
the program will crash... dLibs has been extensively tested by some of
the best crazies I know of. :^) I'd safely say that anyone developing in
C on the ST who is not using this library is probably working far harder
than they need to.

(When/where can I collect on your wager? :^)

If you didn't test it -while- the system is reading from the drive for a
number of secconds at a time, you haven't tested it in-use. Marginal
parts would place more of a load on the system while accessing the drive
and overload the supply... But, if we assume that you -have- tested it
in-use...:

> BUT, nine times out of ten, when I run ANY program on the hard disk it will
> crash, with between two and seven bombs. If I enable auto-booting on the hard

> map bad sectors later, it gives a "Bad sector in FAT -- Disk unuseable" error.

What's so misterious? You probably have a bad drive with a major
concentration of problems in a critical area of the drive. The remainder
of your message just supports this idea... The problem is probably in the
head circuit on the drive itself. If you access a large number of sectors
very-very quickly (as you do at boot time or when running a program) it
can't maintain signal levels high enough to drive the controller...

One other possibility could be emf from some nearby source. If your
drive is sitting next to a speaker, tv, or even your ST monitor, try
moving it at least two feet away and trying again. If that fails, deepsix
the drive and get a good one...

6294. SM124 monitor down, help!

Newsgroup: comp.sys.atari.st
Date: 1988-12-22 22:09:32 UTC
From: litt@bnlux0.bnl.gov
Message-ID: <709@bnlux0.bnl.gov>
Source record: 249944

I have an SM124 (monochrome) monitor down with the capacitor problem mentioned a couple of times recently on the net. The repair shop claims they can't get a proper replacement for the cap. The specs are 2.2uf @ 25volts which are not hard to come by. But the replacements work for a while (typically a couple of hours) then blow out. One possible hint at what's going on is that the original caps are physically very large (barrel mount ~ 1/2" by ~ 3/4") whereas available replacements are much smaller, and apparantly less robust. The monitors in question were apparently made for Atari by Gold Star in Korea. Any suggestions?

I'll admit to being of the camp that tends to say that if an OS repair breaks the application, redo the application. However, it would seem fair to everyone to announce publicly and officially that un-documented features X, Y and Z have been found to interfere with desirable changes to TOS, and that any new OS releases after some given future date will defeat those hacks. Developers who are still in business will have decent notice to remove dependence on such features (as a courtesy, Atari might privately inform developers whose products are known to be at risk, without promising that they'll do so). Some orphan products will become useless to owners of new or upgraded machines, but that will just make more business for the remaining developers. Anyone dependent on an orphan product will probably have to forego the OS upgrade, but I personally think that anyone who stays dependant on an orphan product needs his head examined (and I don't mean disk drive).

6296. Re: ST World (was:hard drive kits)

I would like to correct my original message about my review of ICD Hard Drive Kit being in the August 1988 issue of ST World -- it wasn't. The issue I should have said was the July 1988 issue (Vol. III, No. 7, Issue #23) on page 9.
I would like to take this opportunity to mention that this is NOT ICD's FA*ST hard drive kit but the kit they sold previous to that one. Basically the only difference is the case, which is MUCH larger in the older kit than the sleeker under-monitor design of their FA*ST Hard Drive Kit.
My apologizes to those who were confused by my mis-information.

6297. Directory seperators & shells (was A proposal--TOS Replacement Project)

> Uniterm, only runs under TOS. Ah well...
<more about Minix deleted>

Howard,

If you almost want to "forget" TOS expects backslashes as dir separator in stead of the slash, give the excellent CRAFT package a chance. It consists of a superfast editor (STedi, in most respects a lot faster than Tempus) and a shell which comes very close to csh- you sometimes don't know if you're working on the ST or on a UNIX box! (OK, no multitasking, that's the most important difference with csh). This shell, the GPshell, has a user-selectable directory separator (slash or backslash). Among the many other features I name: command-line history editing (is there life without it?), built-in ramdisk, spooler, redirection and piping, csh-like shell scripts, hashtable for programs along $path, cdpath support, filename completion, invisible workarounds for many GEMDOS bugs (eg. redirection, key repeat), powerful *real* pattern matcher, supports XARGV argument passing, FED font loader, a lot of UNIX utilities like fgrep, pr, more, make, cmp, diff, wc, head, tail, etc. etc.

I don't know of any distributor out there in the States; the product is marketed here by:

ComMedia
Leidsekade 98
NL-1017 PP Amsterdam

Source record: 249953
Cross-posted to: comp.sys.atari.st,dnet.atari

In comp.binaries.atary.st a program named VKILLER was just
posted. It examines the boot sector and the FAT of a floppy
disk for a virus and kills them upon request.

It turned out that most of my floppies at home and at work were
infected by a so called 'key virus'. This virus, once active,
installs itself in the boot sector of every disk a read or
write is performed on. The second action this virus performs it
to wait for a disk with a certain 'key' in the boot sector.
When such a disk comes along it does all the (probably
destructive) actions coded on that key disk. - It is said that
this virus is spread far about germany and the netherlands.

Bottom line: I would highly recommend everyone to use VKILLER.
Kill those virusses! Make sure that your system is not infected!

Thanks to George Woodside for this important program. Keep on
that good work!

Some time before Christmas Bob_BobR_Retelle@cup.portal.com writes:
>Among people who DO own Atari computers, you'll ALMOST NEVER hear them
>criticize the MACHINE itself...

Exactly. Almost all the Atari users I know tend to love the machine, but hate/are dissappointed with/loathe the management. Very, VERY few think they got stuck with a "dog". That's probably why we're all the more sensitive to delayed TOS/Blitter upgrades, and more than somewhat skeptical of new products and promises. Nevertheless, if we actually HAVE the machines, we don't seem to really hate them too much (the only exception I can think of would be the SLM804 Laser).

Does anyone else who's read Atari's plans for 1989 get the feeling that it's a "put up or shut up" year in the US? Notice that at the Winter CES, Atari has pledged increased US advertising/support, and declared the DRAM shortage over. If Atari does NOT deliver through 1989, where do they run? What's the excuse?

Of course, if Atari _does_ deliver in '89, I doubt anybody would be complaining... B-)

From: patrick@hpmcaa.HP.COM
Message-ID: <760001@hpmcaa.HP.COM>
Source record: 249957

Regarding Pieces of Files missing:

I too, have had pieces of files missing only recently. Yesterday I found out why! My Magic Sac System files Mac Finders 4.1 & 5.4 have been degrading in performance and reliability (sounds like a virus?). I kept replacing the system/finders with my backups, not knowing what the symptoms of a virus were/are. Finally they died while eating up my data and program disks.

The symptoms were system error ID's = 15 or 29, when running applications and programs. The disk's desktop info would also require being rebuilt with occasional loss of a file and most notably the system folder would become "Folder #1", or the System/Folder Icons would disappear but still boot properly.

I have been using MacBeep and Ramstart on the system disks. Also using the Stuffit utility for "unarcing" net files.

Yesterday upon boot up the System disk took forever..... and finally displayed:
[Missing
Icon]
System Disk
[^In BOLD text^]
The Disk Icon was missing and the
System Name Was In Big BOLD text.

So.... I clicked on The DA About Finder ....

```
_________________________________
|Copied |
| |
| COPIED |
| |
|832Copied Copied|
|_______________________________|
```

Was Displayed Very Slowly.....
And then the system locked up!

Does this sound familiar if anyone knows please let me know.
Thank You,
PjH

6308. Re: bios function 0x7f

Newsgroup: comp.sys.atari.st
Date: 1988-12-23 23:00:46 UTC
From: david@bdt.UUCP
Message-ID: <466@bdt.UUCP>
Source record: 249958

In response to something Dan Moore said about illegal bios traps
returning a pointer to the bios jump table, Alan Pratt said:
>> Please do not rely on crap like this in your programs. If you do, don't
>> expect them to work in the future. Maybe I should make sure the hack
>> described above stops working, but I'm not vindictive or petty, so I
>> won't.

Then Bob Rogers said:
>Mr. Pratt seems to be complaining about programmers using TOS in an illegal
>way. Perhaps if Atari had ever bothered to publish good, widely available
>documentation his complaint would be valid. Given Atari's disinterest in
>documenting their machine I don't think Atari should complain too loudly
>when folks make mistakes.

You're both right. Allan is correct that un-documented features shouldn't
be used, but Bob is also correct when he mentions that many "official"
features are (or at least were) effectively un-documented. Dan Moore
also makes a good point about how many times in the past someone at
Atari has given mis-information, and now nobody there wants to take
any responsibility for it.

And then someone else discussed ways of informing developers before TOS
updates are released about changes that may break certain un-documented
features, saying:
>Developers who are still in business will have decent notice to
>remove dependence on such features (as a courtesy, Atari might privately
>inform developers whose products are known to be at risk, without promising
>that they'll do so). Some orphan products will become useless to owners of
>new or upgraded machines, but that will just make more business for the
>remaining developers.

This brings us to the bigger problem that is really behind all this.

First, Atari has yet to attract the big developer bucks. This means
very few big-budget development efforts. Especially the early ST
software, but it still applies today. When you are working on a budget,
you can't always attract top-quality people and the end-result may
have more "hacks" than desired. In addition, you can't devote a
lot of time tracking down information from Atari, especially in those
early days when it was almost impossible to get *any* information out
of Atari (I really don't think anyone there knew much about the DRI
stuff yet).

The above applies to at least 90% of the Atari ST software projects.
There just aren't that many experienced software professionals getting
paid to develop Atari ST software.

Atari doesn't want to take the blame for it and neither do the software
developers. So we end up with the Atari ST vernacular made up of
comments like "Developers who are still in business" and "orphan
products". Without major investments by Atari, I don't see anything
more than a TRS-80 type market in the future either (i.e. lot's of
people that like the machine, but far outside the main-stream).

the AES wind_set () call to replace the desktop works just fine. but how
can you set it back to what it was after a program exits? if allan's
listening, i'd appreciate the "legal, official atari sanctioned" way.
in lieu of that (i have not found any pointers/calls to do it), if anybody
knows the addr of the DESKTOP.RSC (tos 1.0?) and HDESKUSA.RSC (tos 1.2/mega?)
and foreign versions (if any) could u mail them to me?

i'm trying to write an application which installs a column of icons on
a desktop-like window. i can do it by just writing on the desktop and then
openning my application windows, but redraws (as i have them anyway) draw
the wrong desktop. i've tried openning a window as a deaktop and trapping
any topping messages but am having some problems. i suppose i'll end up
doing it the hard way (i.e. try a zillion things until i find one that works).

i have grepped memory for the string "RSC" and have found them around
0x10000 on old and mega roms.

thanx much and merry christmas...

Hello,

I have a question for you, has anyone else had the problem that there can only be 112 files on a disk ? yes 188288 bytes in 112 files. that is not a full disk by a long run... but what i need to know is there a way to get around this? i have tryed to make folders... no dice...

oh well,
Greg

6312. Archive Access

Newsgroup: comp.sys.atari.st
Date: 1988-12-24 18:40:00 UTC
From: goertzel@DCA-EMS.ARPA
Message-ID: <8812241917.AA13759@ucbvax.Berkeley.EDU>
Source record: 249962

I now have a fairly long list of archives for the ST which either cannot be accessed from my arpanet host or the logon for ftp has changed ot they haven't done anything in months. What I don't have is any accessible archive for ST software which is active. Clio is gone, HIM1 is unknown to my host ftp. Lakesys is down. Canada1 hasn't added any files in months. RADC is totally inert. SSYX has never been accessible.

Is there any knowlegable individual on arpanet who would list available archives and what the user name, password, directory, etc. is to be able to get new programs either by ftp or via listserver.

I'm sure I'm not the only one who finds this whole process frustrating.

Herb Goertzel

From: 01659@AECLCR.BITNET
Message-ID: <8812250627.AA19871@ucbvax.Berkeley.EDU>
Source record: 249964

To all those who replied and suggested I use 128K ROMs, I AM USING 128K ROMs, I can tell by the "fuller" symbol in the top right-hand corner of the windows.

The mystery I have is why can I not run 128K ROM requiring codes on MY copy of Spectre yet everyone else seems to be able to do it? Is it because I am running off of Magic disks and not "Spectre" disks?

I appreciate all the feedback but no one has offered any plausible solution to my situation.

6315. What happened to the Case Atari people?

Newsgroup: comp.sys.atari.st

I've been making some nice ray tracing pictures with Sun. Now I would like view them with my fried's ST using Spectrum. I know Spectrum picture format and general idea how it works. However I don't know enough to be able to make corversation program between ray tracing and Spectrum picture formats. So if someone could expain how exactly Spectrum picture format works. Or if someone could send few lines code how to convert any known color picture format to Spectrum picture format. You can mail to me or to this newsgroup. Thanks for any answer in advance.

>specs are 2.2uf @ 25volts which are not hard to come by.

> Any suggestions?

Sure;

Just use a larger size (as in working voltage) capacitor. The value
the same, just that it's working voltage is larger. Should hold up
better,providing that there isn't something else causing the cap
tp fry up.

Typically with caps, you can go `larger' with both the value and the
working voltage, but this is dependant apon whether or not the
cap is used for timing purposes or not. To be safe, just get a
2.2uf @ 75 ~ 100 wv.

Should solve the problems.......

the root directory IS limited to how many files/subdirectories you can place in it. if you check the boot sector of your disk, word at location $11 contains the number of possible directory entries, at least according to the Abacus book "ST Disk Drives: Inside and Out". it doesn't say if this number is for the root directory, or for the entire disk. If you need more entries, try creating a new boot sector (using xbios function 18 - Protobt), and formatting the disk yourself. i haven't done this myself, so this may all be wrong :-)

but i *think* there is no limit to how many files you place in a subdirectory.

I thought Lakesys was coming back up... Oh well. If your host doesn't recognize the name him1.cc.umich.edu, use the address instead - 35.1.1.43. Clio couldn't afford the disk space finally, which is why we needed to move things to HIM1. Login as "anonymous" and use any password, then Change Directory to the ST archive. ("cd pc7:")

By the way, we should have a complete index in a few days. We've also weeded out duplicates and old versions of programs, leaving roughly 32M of ARC'ed programs. We also have 2 years worth of Info-Atari16 digests archived here.
%

%I'm sure I'm not the only one who finds this whole process frustrating.

True, it can get pretty frustrating. We found some corrupt archive files on Him1, which some people reported to the net. They're fixed now, but I'm sure the people who spent the time downloading them were pretty frustrated too. Can only say "sorry - we tried, it's OK now."

Jon and I spent 8 hours downloading all of the him1 files to floppies recently. Figure about 40 double sided, 800K floppies to get everything. Perhaps after we have the index we can offer the collection by mail. It would be pretty time consuming to do this sort of thing though...

>way to get around this? i have tryed to make folders... no dice...

There is only a 112 file limit on the root directory of a floppy disk.
If you create subdirectories (folders) they can dynamically increase
to accomodate any number of files. You must remember though, that any
folder you create at the root level needs one of those 112 slots, so
if you aleady have 112 files on the disk you must move or delete one
of them before you can create and use a subfolder.

As a general rule, I never create plain files in the root directory of
any disk, only folders. With hard disks, the size of the root directory
can be larger than 112 file slots, but it's still a fixed limit, and I
prefer not to have to worry about it. (Kind of a hassle that desk
accessories must go into the root directory of the boot disk. Really
wreaks havoc on my disk organization... And some of my applications
refuse to run if I use ACC.PRG in my AUTO folder. Weird stuff. And of
course, even with ACC.PRG, the silly accessories try to find their
resource files in the root directory as well. What a pain...)

6321. Tweety Board from Practical Solutions.

Newsgroup: comp.sys.atari.st
Date: 1988-12-26 03:13:29 UTC
From: russ@percival.UUCP
Message-ID: <1436@percival.UUCP>
Source record: 249971

I've installed the Tweety Board on my ST. What it actually does is keep all three sound channels seperate and you get a three jack connector out of your computer. Obviously your stereo is not three channel so they have included a "Y" cable adaptor so you can merge two of the channels together. It comes out sounding pretty good with a speaker on each side of my computer BUT as more games take advantage of digitized sound, this little gadget will become less useful. The reason for that is to make digitized sound to sound better out the ST's sound chip, most of the time they use all three sound channels together additively. This results in stereo "noise" which is worse than listening to the monitor speaker. (I've got a separate audio out jack for just listing to digitized sound)

Hope this helps your decision.

A very critical parameter in a power supply cap is the amout of current it can carry (ripple/AC or whatever) when being used as a filter. This is not normally printed on the case of the cap. Typically larger (physically) caps will have a lower ESR (don't know what that stands for, but high ESR is real bad for a power supply cap). So just go for the same voltage, lower ESR (or physically larger package, or labeled "for power supplies".

6324. speeding up disk accesses by pre-read cache ??

Newsgroup: comp.sys.atari.st
Date: 1988-12-26 15:55:33 UTC
From: RCOPROB@HDETUD1.BITNET
Message-ID: <8812280301.AA19387@ucbvax.Berkeley.EDU>
Source record: 249974

Is there any program to speed up disk accesses to two files concurrently, e.g. sequentially reading from one file and writing to the other?
The run of the mill disk caches only keep the recently referenced blocks incore while a more advanced disk cache could also prime the cache memory with blocks that may "soon" be read, aka pre-read.
The cache may decide that a file is being read from the beginning, and that subsequent block will be needed shortly. Hence it may read these ahead of time thereby making use of the favorable position of the read/write head on the disk .
Such a cache would speed up programs like UUD and ARC, which don't do their own buffering (compilers too?) and get stuck with TOS's non-buffered I/O, by eliminating or at least reducing arm movement on the disk.
Please inform me of the existence of such caches, by direct mail if possible since I am not subscribed to this newgroup anymore. I only browse through the logs when I need some info....

Hello World,

I've had two power supplies die on me, the life span of both was approximately a year and a half. With power supplies costing from $50 to $70, this is not a welcome expense. Most people I know with 1040's haven't had this problem at all. (I have an upgraded 520). So, I've heard that for other computers there are 3rd party or "after-market" supplies available for less. If anyone could point me towards a source of cheap power supplies, I'd be eternally grateful. Also, I need to know the voltages of the secondary output from the transformer in the Atari supply. Lastly, has anybody else burned out their external supplies and is there maybe something I'm doing wrong that's causing these deaths? I do use my computer a hell of a lot, but dropping $50 every year and a half is not appealing (and out here the supplies are $75 which is ridiculous). Help!!!!

Reply to me personally, please. I will post a summary to the net, if there's interest.

> >Most people who criticize Atari's don't have an Atari and are VERY
> >biased... oh well, such is life.

Well, I own two Atari 800s and an Amiga 1000. I have had an Atari 520ST and an MS-DOS machine (Tandy 1000HD). By that logic I should be unbiased and have an evenly balanced viewpoint. I don't. My opinion of the Atari ST, due to my experience with mine, is that it is a poorly-thought-out hack, and the spiritual descendant of the Commodore-64.

It's worse than teh C=64, because much of that machines limitations are the result of when and how it was produced. When the ST came out, there were at least two decent operating systems for the 68000 available: OS/9 and Tripos. Why they went with Gem-DOS I have no idea.

Programming on the ST is exactly like programming on the IBM-PC, except that there are fewer tools available, and more bugs to work around. After a couple of months of struggling the ST went into storage and I financed an Amiga.

> the true problem... the manufacturer of what is arguably the BEST value
> in low cost computers does NOT, for whatever reason, tell the world about

> an uphill battle..

That's true. Commodore has done a lousy job of advertising the Amiga. How nice of you to notice. (Yes, I know he's talking about the ST. I don't know why... Atari has done a very good job advertising the ST, with much more frequent and affective advertisements than Commodore)

> Among people who DO own Atari computers, you'll ALMOST NEVER hear them
> criticize the MACHINE itself...

Well, you've heard it now. The hardware is unexceptional, and the operating system (if you can call it that) is only exceptional in its intellectual poverty. If it had been well designed in the first place, people wouldn't need to make the sorts of hacks that Allan Pratt so despises.

Well, Hackercorp has a library front end that does much the same thing.
However, I hope that you don't depend on the behaviour of dLibs... or if you
do I hope you don't ever port your program to another machine.

Hackercorp's memory management routines are machine-independent, and when
they detect an error they inform you. That way you can fix your bugs (freeing
memory twice is a bug) instead of hiding them. I hope dLibs does as well.

Message-ID: <8812271702.AA11024@ucbvax.Berkeley.EDU>
Source record: 249982

Speaking of "legal official atari sanctioned" ways, how do you set the step rate of one floppy (e.g. drive B) to 6ms. I know how to do it by modifying an unpublished address, and there is a call to set the default step rate. But the latter call must be done before some initialization, which I believe (from reading the ROM code) to be boot time and affecting both drives. Can it be done?

> > crash.

I do not consider this a bug. Who does? The fact that you attempted to free a block twice is a bug. It is *nice* when an OS guards against programmer errors like this, and even nicer when the OS is completely bulletproof, but it's not a bug when it's not.

Secondly, the Malloc system call is not intended for general memory management: the overhead in memory and time for using it are prohibitive. Also, of course, it has limits. The fact that there are limits *is* a bug, but it's a design flaw and it's too late to fix it because people (A) break the rules of memory ownership and (B) rely on undocumented side effects. (There were net.wars about this earlier.)

6335. Atari ST RTS/CTS flow control.

Newsgroup: comp.sys.atari.st
Date: 1988-12-27 22:11:43 UTC
From: logajan@ns.UUCP
Message-ID: <1043@ns.UUCP>
Source record: 249985

I could use the RTS/CTS method of flow control for the AUX (RS232) port.
But it seems to be non-standard in that you have to jiggle (as Internals
says) the CTS signal for each character, and most external products don't.

Any clues on this?

I own an 800 and a 520. I've programmed both machines extensively as well as machines from IBM (RT, PC), Apple (//e, Mac), DEC (VAX/VMS, Ultrix), Sun (SunOS/X11) and various others.

> By that logic I should be unbiased and have
>an evenly balanced viewpoint. I don't. My opinion of the Atari ST, due to

>spiritual descendant of the Commodore-64.

I think your statement is probably false. I totally agree with your assessment of the ST so I think that your viewpoint is evenly balanced and unbiased. "Fair" does not mean "without opinion."

My 800 is a very useful game machine, a gem for its time. My 520ST is a terminal emulator/file storage device. To be fair, if I owned an IBM PC it would probably serve the same purpose.

Actually to be really fair that's probably about the only thing I'd use anything for unless it ran some form of Berkeley Unix. :-) (Well, maybe I'd use an Amiga for a frame buffer :-) :-))

Go ahead and flame me, this subject is now in my kill file (electronic asbestos).

> you put in the AUTO file and supposedly it allows you to run lo & med
> res programs on a monochrome system, and also monochrome programs on a
> color monitor. It's been out for a while but I have seen no reviews
> or actual user comments on it.

You appear to know quite a bit already... :)

> Does it really work,

Yes... On programs that follow the 'rules' about only altering colors
or 'real' video modes via the bios or gemdos function calls. Writing
directly to the hardware is a no-no..!

> on ALL programs,

No... Any fancy color tricks or -real-brief- flicker/animation effects
sometimes don't show up on the screen because they're there too short a
time for Omnires to map them over to the CRT in the 'real' video mode.
Also smooth animation effects often show up as jerky movements because the
virtual screen is mapped to the real screen several times a second. (They
could have done better if -ALL- (101%) of screen i/o were done via legal
means, but too many programs cheat and write directly to the screen.)

> any performance degradation?

Yes... It varies from almost none to quite a bit depending on which of
8 different configurations you use on boot-up. There are 8 different
convertor routines. The more complete the mapping, the slower the
display.

Any other questions?

Well, before I upgraded to a Mega-4, I had a Tech-Specialities board installed in my 1040. It worked pretty well, although the installation can get tricky. (The main problems being that on my board, one of the ribbon cables was *brittle*, and actually snapped from being flexed too much during the install. Simple enough to replace that, but it was somewhat inconvenient...) Also, with most upgrades, you have to add-in a plug to the video shifter chip, and the pins on that plug are easily bent out of alignment. (Worse yet, easily broken.) Basically this just means you have to be very very careful installing one of these things.

I liked the board though; I only had 2 meg installed on it, giving me a 2.5meg system. I also got the clock option with it, which was a handy addition. Note, however, that ocassionally the system would bomb after booting up with the clock-setter. Dunno why, someone else told me "it happens" and I left it... (Something about accessing the IKBD after a boot...?)

[blah!]

I am a bit confused over the "2.5 megabyte" specification. To
paraphrase Howard Chu, he writes that he installed a memory expansion
board with 2 megs on-board into a 1040. How does this yield 2.5 megs?

Thanks,
Mike

(I added the Amiga and Atari groups to this thread -- John)

There certainly has been a substantial amount of research on the topic. I suspect it's a favourite of grad students who don't like N-dimensional matrix theory :-).

First of all, I've never liked the desktop metaphor much. My desk is completely taken up by a computer system, printer and floppy disks :-) ! The contrived nature of desktops appeals most to people who are locked in to that way of thinking, by years of experience in the conventional office environment. The window concept is IMHO the best jumping-off point for novices, who can move

on to specialized ideas like desktops after they have a grasp of the basics.

I wonder if the NeXT interface builder has the potential to condense the intial learning stage, by presenting a number of different metaphors for interaction in such a way that the pattern becomes apparent? That is, no matter what sort of action you're performing you need a way to do X, Y, and Z, and these capabilities are always present in some form. At the same time some people need A, other people don't but they do need B and C.

A good way (I've found) to introduce the "window" metaphor is to take someone accustomed to the VT100, Csh prompt etc. and present them with a full-screen window running the same setup. Then after they see that the new environment is a superset of the old one, not a flawed replacement, present them with some circumstance where keyboard-based interaction is clumsy -- move the vi cursor to such-and-such a spot, or run two processes that both want to do screen output simultaneously -- and show how having a mouse makes it easier, having windows makes it possible.

For the complete neophyte it's trickier. They don't know the good points and bad points of any interface. Very often (eg in a student environment) they may not be accustomed to a desktop like the Mac's, and so they have to learn that at the same time as they learn the general ideas of mouse/icon-based interaction. For them it's usually quick and easy to pick up since they don't have so many preconceived ideas, but I think locking them into one particular mold ("to delete, toss things in the trashcan") is not as good in the long run as giving them a broader perspective of things ("deleting files or other objects is something you'll always need to be able to do, and every system should allow you to by some method. One way, used by the desktop metaphor, is to display a trashcan into which the objects to be deleted can be 'dropped'.").

> and foreign versions (if any) could u mail them to me?

There is no function call to get the resource of the desktop. When an
application makes a wind_set(WF_NEWDESK) call, it doesn't need to reset it
back when it exits. When control returns to the desktop, the original
background will be restored.

The desktop's resource is "glued" together during the system build,
its location is different from release to release, so don't bother searching
for it in memory.

> free a block twice is a bug.

I agree with this emphatically. The original debate, which has been lost
in the mists of time, is that the Amiga memory allocation is flawed because
it doesn't watch for this bug. I was saying that the same thing probably
would happen on the ST under the same circumstances, and that this wasn't
a problem with the ST or the Amiga... but with the program in question.

> Secondly, the Malloc system call is not intended for general memory
> management: the overhead in memory and time for using it are
> prohibitive.

The problem is that most 'C' runtime environments deal with the problem
by Mallocing all available memory and doling it out. This is a problem
because it screws up when you try to call another program and the exec
call fails because there's no free memory.

I sympathise with you, by the way. I can see your frustration building up
as you try to keep the horde of PC hackers out of the innards of your box.
I suppose it's too late to file the serial numbers off OS-9 and call it
TOS-II.

I have to agree - it is a year of reconing for Atari. They cannot go much farther on the intertia of the 520STs, and even the Megas are more like a "fat" 1040 than a really new computer. Even if every other computer can be upgraded with blitters (i.e. the 520STFM), it won't make too much difference (the blitter chip is nice, but not essential).
Commodore is not sitting still, and I suspect that if Atari does nothing, I may trade in my ST by the end of '89 for something else, potentially an Amiga. Then there is Macintosh, and a lot of the faster clones are getting cheaper.
The portable (STacey?) will make a big difference and I hope they will have versions of this as fully expanded as the Megas (i.e. 4 Megabytes, with larger, fast disk drives, e.g. the 80 Meg quantum). I don't think there is any high powered portable out there in the price range this would fall into (i.e. a Turbo AT portable with fat disk). Then put a Spectre 128 on it and see what happens. They also should increase the speed.
Even more significant may be the 68030 box. It seems like most of the NeXT, but for a lot less money. This opens up more markets where something more powerful is needed (desired), but not generally affordable.
Then they should continue improving the ST - First they should go to SIMMs so a memory upgrade is swapping a small board. Then they should allow 12 meg ram space (with video and DMA). 16+ Mhz would be nice too. And more colors and resolution. And an expansion bus.
And they should do more with peripherals - the Laser Printer was a good idea, now the CD should make other things easier.

But if they continue to ignore the american market, they shoudl move their headquarters to Europe.

since i'm the horrible fiend who started this mess by asking a very simple question (which dan politely answered), let me just ask allan this: ok, fine. there are programs that rely on the way things work, both documented and undocumented, probably more of the latter, eh? but why not just fix what is there (like Pexec/xmain forcing lower case args, tiny command line buffer of 255 char, etc) by offering a parallel development of "corrected" utilities? is rom real estate THAT tight? heck, i'd even load the sucker from disk every time i booted (if gem was fixed i would not have to reboot every 2 hours anyway). in my own programs, i never rely on undocumented features, though many are tempting. you should either sh*t or get off the pot. make your beloved changes that break half the software (which sells your machines) of live with it and adapt to the often pioneering efforts of us wcky developers. just don't throw a public tantrum, it makes both you and atari corp look bad (neither of which, incidently, i want to see).

if corporate policies at atari are so bad, the machine does not deserve to survive. if, on the other hand, atari is REALLY interested in being the number 2 or 3 pc in the world, grow up and start acting like ibm rather than some undisciplined wimpering child. kick some ass. just make sure it's not some important developer's ass yer kicking :^). you may find yourself out in the cold...

i just think this whole argument is a bunch of crap. since when has standards stood in the way of any (perceived) top-notch computer hardware/software company? besides, if atari fails, all this banter is just a lot of hot air anyway. who really cares? just EVOLVE. if that means ruffling some feathers, so be it...

now lets get on with it. (BTW your own developers newsletter published several undocumented tidbits like houw to reset the desktop after a wind_set (...,WF_NEWDESK,...)...shall i tell them how, allan?).

The board comes with 32 sockets. There are originally 32 256K RAMs in the 1040. (The chips in the 1040 are soldered directly...) The Atari Memory Control Unit can only handle 32 chips. Ok... 2 meg, in 1Mbit chips, is 16 chips. Why leave the control unit idle on the other 16 addressable chips? Configure the board to use the 16 1Mbit chips, as well as 16 of the old 256Kbit chips. That all adds up to 2.5 MB. After this upgrade, you're left with 512KB worth of 256Kbit RAM lying around, with the other 512K of the 1040's original 1 MB still in use.

>way to get around this? i have tryed to make folders... no dice...
>
> oh well,
> Greg

Disk? Maybe you mean "diskette" as in floppy. It also sounds as though
you've stuck all 112 files in your root directory. The answer is that you
can have only 112 files in the root directory of a floppy, but you may have
as many files as you can fit on the diskette if they live in one or more
subdirectories. This is true for MS-DOS as well as TOS, since they share
the same filesystem.

The number of root directory entries will vary with the format of the
disk. The maximum number of root directory entries can be found
by looking at the word beginning at byte 17 of sector zero on your disk.
Note that this word will be in the "little-endian" format.

case SET2:
case SET3:
strcpy(s1,selptr[n]->te_ptext);
/* tree[n].ob_state &= ~SELECTED; Return to normal */
HIDE_MOUSE
objc_draw(tree,SETSEL,0,cx,cy,cw,ch);
SHOW_MOUSE
break;
etc.
```

The form consists of several BOXTEXTs (SET0-3) which are marked as
SELECTABLE and EXIT in the resource. The problem that I am having is
that when I select one of the BOXTEXT objects with the mouse, the
box reverses as it should except for the small rectangle under the
mouse. Multiple selects keep leading to ever more checkerboarded
boxes. This condition exists immediately upon selection, in other
words, it exists on the screen at the return from the form_do.
This obviously doesn't happen on most people's programs so
why does it on mine? Is there something that I have forgotten or that
I am doing out of sequence?

One other question: How do you find the name of the program you are
running under GEM? Under a shell, it comes in argv[0] but that isn't
set when starting from GEM.

Any help would be appreciated!

Thanks,

Bob Foster

I am very curious about the STacey. From where I am sitting there really doesn't seem to be a market for it. The only reason I can see for a portable is to take your work with you. Well, in the US, very few companies use the ST at all. Now granted, I can see where it might be worth it in Europe where the ST has its buisness image, but even there enough ST's (only 1million) have not been sold to justify it.

Just on a side note. There are no hardware flaws with the ST. All the bugs are in software. I remember reading in another article that the hardware was hacked. I don't get it. THe hardware is all off the shelf, the system never crashes or behaves unpredictably due to hardware problems.

The NeXT is really not that exciting on a pure "specs" basis. What makes
it amazing is the integration... which is still in the process of going
together. And the new Atari is not known for well-integrated products.

This multi-tasking system was submitted to comp.binaries.atari.st and comp.sources.atari.st... I have been looking at the program which gives one ST remote access to the other's disk drives.

Until I look a little further, my advice is this: DO NOT USE THIS PROGRAM! I am talking about the network file system part of the MX distribution: the rest, for all I know, works fine.

The problem with the networking part is this: it changes the contents of the disk without GEMDOS's knowledge. This can be disasterous if the program changes a disk block which GEMDOS has in memory. There is no (legal) way to know if GEMDOS has a block cached, and even less of a way to tell GEMDOS that a block is suddenly changed, and it's even WORSE when GEMDOS has a block cached AND HAS CHANGED THE CACHED IMAGE (that is, the cached block is "dirty").

If you use the networking for reading only, or if you are EXTREMELY careful about how you use it, you can succeed. By being careful, I mean that the person using the ST locally and the one using it remotely should never access the same logical drive. I don't mean not accessing it at the same time: I mean accessing it EVER.

If you restrict both users to read-only access to a logical drive, you'll do okay. So if you both access drive E: for reading only, and one of you accesses drive D: for reading and writing, and the other one accesses drive F: for reading and writing, you should do OK.

If you want a detailed disaster scenario, here it is:

User L is local, user R is remote, and mx2net is running on both machines.

User L begins editing D:\SRC\FILE1.C. GEMDOS caches part of the FAT from drive D:.

User R begins D:\WORK\FILE2.C (that's D: on L's system). *His* GEMDOS also caches part of the FAT from drive D:.

User L writes his edited file to disk. It got bigger, so a new cluster is allocated. The new FAT is written to disk.

User R writes *his* edited file to disk. It got bigger, too, so a new cluster is allocated. But User R's GEMDOS uses the cached FAT from drive D: to allocate the new cluster, and allocates the same one!

BAD NEWS. It can get worse, too. Notice that it doesn't matter that they aren't accessing the same folder, and it doesn't matter if they don't do it at the same time: the problem is that user R has an out-of-date local copy of a sector on drive D:, and his GEMDOS can't know it.

But if all the drives they both use are read-only, then they can each use other drives for read/write and never get into trouble.

This is not as much of a problem under TOS 1.0 or 1.2, because GEMDOS is really stupid about invalidating perfectly clean, cached sectors, but TOS 1.4 is *not* stupid about it, and it is really easy to get bitten by this. It's still possible under TOS 1.0 or 1.2, however.

I applaud the effort which the author has clearly put into this. I have not tried, let alone analyzed, the multitasking part. I hope he has not fallen into the same local-copy-of-global-data trap. Has anyone out there had experience with the previous versions of this code?

It's nice to hear that some people follow the rules.

This discussion of the ongoing confrontation between OS designers and devlopers is not new. It is also not restricted to Atari. Just ask Apple about this problem.

I read in a recent issue of Byte Magazine (September, perhaps) about the Apples Multi Finder system. The article presented some of the enhancements added to the system to support their multitasking environment and it presented some of the fixes required to support all of the existing programs. In short, the folks at Apple were amazed at the number of programs that did not follow the rules. As a result, the curent version of Multi Finder includes many patches. A few of those patches were included for the benefit of a single program. This should not have been necessary.

The abuses of Apple developers forced Multi Finder designers to make unnecessary compromises. Each compromise means that at least one efficient way of performing a given operation becomes blocked and the designer must choose a less efficient method.

Now put yourself in Allan's place. You're in the middle of an ongoing process to develope an efficient operating system. Your team is playing with 196K of low level coding which must be tweaked for maximum efficiency. Then some bozo comes along and decides to use a short-cut. He's already told all of his

friends about his latest trick so you must grudgingly accept even though you now have to accomodate that new feature. That bozo just created more work for you that was not necessary. Futhermore, your freedom has been restricted so now instead of that elegant solution you came up with, you have to gludge something together and make it work. Wouldn't you be a little upset?

Well, if this ain't it, you must be mixing graf_mouse() and
some other version of mouse on/off like v_show_c() v_hide_c(). When you
use these two functions, you should pick one and stick to it, don't
mix them, or GEM get's confused...

Also, if you forgot to hide your mouse _anywhere_ in the program,
you can end up with problems like these. AND if you don't reset GEM after
confusing it (i.e. you're in a shell and don't exit to the desktop) GEM
can continue to be very confused and you my never be able to see that
you fixed your bug :-).

>
This is correct as far as it goes. But there is a legitimate need to reset
the revised desktop when the program has been called from a shell. Otherwise,
the AES will attempt to redraw the specified desktop, but the resource for
that desktop will have been released at the time that the program terminated.
It is my understanding, although I haven't tried it, that wind_set(WF_NEWDESK)
with an address of 0 will reset the desktop.

The best upgrade board I have seen is made by Datafree in Toronto.
It is a 4 layer board for noise immunity, fits inside 1040's and 520's
and connects via a small plug in daughter card and a 16 point solder
template. It is VERY reliable and easy to install.
It gives either 2.5 megs or 4 megs of memory depending how many
1 meg drams you install.
I don't have an exact price but it is in the $200 range.

6366. Publishing Partner/ Page Stream Updates

Newsgroup: comp.sys.atari.st
Date: 1988-12-30 22:05:24 UTC
From: fyl@ssc.UUCP
Message-ID: <1612@ssc.UUCP>
Source record: 249866

I just called SoftLogik to see if there was a newer version of
Publishing Partner than 1.01. The answer is 1.03, about 1 year
ago, but they didn't know if it fixed the bug I reported in February, 87.
(The bug is that a round cornered box of size 0 creates bad PostScript -
causes the PostScript interpreter to get an error. You, of course, can't
delete this box because it has no size so you can never click on it.)

Anyway, here is the new news. They claim that they will have a real
version of Page Stream available next Monday that works. I groaned and
told them what was wrong with the last one. They claim:
* to have it debugged
* to have a document conversion program
* to have a font conversion program
* to care about the bad reviews and hope to correct that

I elected to settle for the PP 1.03 release for now but, maybe, they
are starting to get their act together. I would have abandoned them long
ago except I need PostScript output and have a bunch of existing PP
format documents.

6367. Sozobon bug / some Dhrystone results

Newsgroup: comp.sys.atari.st
Date: 1988-12-31 00:41:38 UTC
From: egisin@watmath.waterloo.edu
Message-ID: <22922@watmath.waterloo.edu>
Source record: 249867

There is a serious bug in the Sozobon assembler.
The instruction "btst #0, Dn" generates a 32 bit immediate
operand instead of a 16 bit operand. When this is executed,
the extra second operand word is executed as an OR immediate instruction.
The "real" instruction following the btst is consumed as data.
I don't think the compiler generates btst's, but memcpy() has some.
The easiest fix would be changing memcpy, you can
probably change the btst to "moveq #0,Dtmp; btst Dtmp,Dn".

I compiled Dhrystone 2 under Sozobon and GNU C recently,
here are the results. GCC was using 16 bit "int"s.
I used an "optimized" version of the C string library with Sozobon and GNU.

Compiler Options Dhrystones/second (with registers)
Sozobon 1001
Sozobon -O 1066
Mark Williams 3.0, optimized 1173
GCC 1.30 956
GCC 1.30 -O -fomit-frame-pointer 1282

Dhrystone version 1.n results are meaningless for optimizing compilers.
Dhrystone 2 has been posted twice to comp.arch,
I don't know if it is on any public servers.

6368. Eric: ST-Nethack collapses

Date: 1988-12-31 00:51:16 UTC
From: csrobe@CS.WM.EDU
Message-ID: <8812310051.AA15136@cs.wm.edu>
Source record: 249868

Greetings!
I've been playing nethack on my ST for a few weeks now and
recently the dungeon would collapse when I would go down the stairs.
It would complain about reading only 0 bytes from the LEVELS files
when it should have read 2 bytes. It saves the character,
asks me if I want to identify my possessions (but doesn't show them),
and then kills my character via a "panic" and puts him in the scoreboard.

Does anyone have any ideas on how I can overcome this problem? Do I
just have a corrupted file or is it more fundamental?

cheers,
-c

[discussion of the problems involved in upgrading system software and a comment that "even apple" has problems with badly-behaved programs]

Apple is a poor example. You might want to use AT&T and the various flavors of UNIX if you want to talk about big boys having compatibility problems.

But even that's misleading, because now you're dealing with nearly 20 years of software changes, instead of 4 or 5.

The Amiga system software is now into the fourth released revision with no major problems so far. A completely new file system with different-sized blocks has just been put in place, and there are still no problems.

Two points to bear in mind. First, much of the enhancements that are causing the problems in other systems (multitasking, virtual environments, and so on) were built into the Amiga software to begin with.

Second, there are areas documented (even to having include files) but marked "here there be tygers". Commodore has said, over and over again, that the WILL change the system and they WILL break things. They have also worked with developers who needed to do stuff they didn't support so their software would continue to work after it became supported.

They have changed the system, and things have broken. But never very much, and the blame has always been on the developers. There are still plenty of old programs that do quite sophisticated things that run under the latest version of AmigaOS.

Moral: Atari should say "the following programs are going to break in rev such-and-such of TOS. Other programs that make this, thato, or the other assumption will also break. We're giving you X months warning. These changes are necessary to fix the a, b, and c bugs and to add these enhancements...".

Then DO it. Fix it. It's like going cold turkey, but at some point you just have to stop throwing good money after bad.

Sure would. Here's my proposal - let Allan write the perfect OS and
release it. Then let all of us that like to hack on the OS write patches
to put it back into it's original broken state so that we can run the
poorly written software. Everybody will be happy...

I get to write fatslow - who wants to write foldr000 and zerofill? :^)

Same here. I haven't been able to get through to clio, him1 (35.1.1.43),
or euterpe ((35.195.16.2) lately. Clio and HIM1 won't let me login...

I saw a message on prep.ai.mit.edu that said that on the HIM the anonymous
login had been changed to 'PC7', but this doesn't seem to work either...

Does anyone know how to contact any of these hosts properly?

The document converted from PP to PgS exists, I've used it. It works
fairly well (I've had some documents that don't go through it, but most do.)
It can be found on GEnie (type SOFTLOGIK) or CompuServe (go AtariVen).
On CompuServe, I have also been told that the upgrade to 1.1 of PgS (about
two weeks ago) has been delayed since they'll release 1.4 instead, then
that 1.4 will not change to 1.5, etc... I think PageStream will be version
at least 1.5 by the time they get their first upgrade out. (There was
also some talk of posting it to services like Genie and CIS.)

Disclaimer: I am not associated with any of the above companies (SoftLogik,
GEnie, CompuServe).

If the STacey (aka portable ST) has an impact it might be because there will be a lot more applications for an inexpensive but portable computer with a lot of power. I would like to have one now - I brought in my ST to work, and can do a lot of nice things having it cross between the PC and Mac worlds. But my setup (worse since I have the old ST with the wire nest in back) doesn't travel well. If you have seen those Macintosh ads where people bring their computer to work with them you may get the idea. Several people "lug" their Macintoshes in and out regularly. The ST could displace some of that. Remember that adding portability creates NEW applications where they didn't exist before, and generally enhances the ST's strong points.
The only hardware complaint which I may have for the ST is that it isn't very easy to expand. Their video memory is limited to 4 Megabytes (which is a lot, but applications grow to fill up available capacities). There is no expansion bus and only a single slot on the Megas. You can't easily gain resolution (If I wanted to create something that did 16 million colors I would have to redo the hardware almost completely). And faster processors have the same problem. These are lessened to a great extent since the ST has so much built in, and that is done fairly well (separate processor for mouse and keyboard, DMA (though the FIFO's and byte sized sector register could be done better), and all the ports).
